PSYCHOLOGICAL ABSTRACTS 1976 CHANGES

Content Classification. As the result of an extensive study of the psychological literature, a new classification system for 1976 has been developed which groups the literature in a manner more useful to the reader. This classification outline, showing major and minor subject areas, has become the new Table of Contents. The January 1976 issue of *PA* describes these new classifications and their contents in the *Guide to PsycINFO*.

Dissertation Abstracts International. In 1976, *PA* will resume coverage of *Dissertation Abstracts International (DAI)*. Since coverage was suspended in mid 1973, there will be a period of catching up to insure that all material will be included in the 1975-1977 Cumulative Index and that no gaps will appear in the retrospective data base. The relevant dissertations for the last half of 1973, all of 1974 and 75 will be cited in the 1976 issues of *PA*. In 1977, all relevant dissertations from 1976 and 77 will be covered. The 1978 issues will include *DAI* as one of the regularly scanned journals on a current basis.

GUIDE TO PsycINFO

The *Guide* (located in the back of this issue) describes innovations in *Psychological Abstracts (PA)* as well as derivative products and services designed to facilitate selective access to the world's scientific literature in psychology and related disciplines. Additional, separate, copies of the *Guide* are available upon request.

Psychological Abstracts (PA) provides nonevaluative summaries of the world's literature in psychology and related disciplines. Over 850 journals, technical reports, monographs and other scientific documents provide material for coverage in *PA*. About 20% of the records published in *PA* are bibliographic citations or annotations which are used to cover books, articles peripherally relevant to psychology, or articles that can be represented adequately in approximately 30-50 words.

Issue. The monthly issues contain abstracts listed under 16 major classification categories, with some categories having subsections, as shown in the Table of Contents. Under each classification heading, the abstracts are arranged alphabetically by first author. Abstracts are numbered consecutively in the two volumes produced each year.

Indexes. An author and brief subject index appear in the issues. An expanded and integrated Volume Index is published every six months. Three-year cumulative indexes are also available.

PsycINFO. *PA* records published since 1967 are now on machine readable tapes which provide the basis for automated search and retrieval services known as Psychological Abstracts Information Services (PsycINFO). For more information on these products, uses, and costs write to PsycINFO, American Psychological Association, 1200 Seventeenth St., N.W., Washington, D.C. 20036.

Correspondence on copyright matters should be directed to the permissions office, on back issue sales to the order department, and on subscriptions and address changes to Anne Redman, Subscription Manager. All correspondence should be addressed to the American Psychological Association, 1200 Seventeenth St., N.W., Washington, D.C. 20036.

Address changes must reach the Subscription Office, APA, 30 days prior to the actual change of address. Copies undelivered because of address change will not be replaced; subscribers should notify the post office that they will guarantee second-class forwarding postage. **Other claims** for undelivered copies must be made within 4 months of publication. Address your claims to Subscription Manager, APA.

Subscriptions are available on a calendar-year basis only (January through December). Published monthly in two volumes (January through June, and July through December), each volume contains approximately 15,000 abstract records. Volume indexes are published twice a year under separate cover. Subscription price including indexes per year is \$220 domestic, \$230 foreign. To subscribe, write to Subscription Manager, APA.

The examples of different types of *Psychological Abstracts* records presented here are number coded to provide definition of their elements.

JOURNAL ARTICLE ABSTRACT

¹1271. ²Conger, Anthony L. & Coie, John D. (Duke U) ⁴"Who's crazy in Manhattan: A reexamination of "Treatment of psychological disorders among urban children." ⁵*Journal of Consulting & Clinical Psychology*. 1975(Apr), Vol 43(2), 179-182. — ⁸Reanalyzed data reported by T. S. Langner et al (see PA, Vol. 52:8150) on the prevalence of psychological disturbances in children from welfare and cross-section homes. Results indicate that the data show no meaningful differences in means or skew and a paradoxical greater heterogeneity among welfare children. Some of the difference in variance is clearly attributable to the differential reliability of final scores, and perhaps the remaining difference is due to between-rater differences. Unless other factors were operating, 2 possible conclusions are tenable: Either welfare children manifest both more health and more disturbance than cross-section children or there are no differences in disorder between the populations. A 3rd conclusion is also offered: The populations do actually differ, but the manner in which the disturbance was viewed, rated, and compared necessarily obscured any differences.⁹ (15 ref.) — ¹⁰*Journal Abstract*.

- 1—Record number.
- 2—Author(s) or editor(s). As many as four are listed; if there are more than four, the first is listed followed by "et al." Succession marks (i.e., Jr., II, III, etc) are not given.
- 3—Affiliation of first-named author/editor only.
- 4—Article title, including subtitles: If the original article is in a foreign language, the translated title is given in brackets and the language of the original article is indicated in parentheses.
- 5—Primary publication title and bibliographic data.
- 6—Text of abstract.
- 7—Reference to a previous entry in *Psychological Abstracts*. If an abstract number is unavailable at time of publication, the issue number is given. Consult the Author Index of the *PA* issue noted in order to determine the record number for the article.
- 8—Summaries included in the primary publication are listed when in language(s) other than that of the article.
- 9—Number of references is included when there are 15 or more listed.
- 10—Abstract source.

BOOK CITATION

¹1703. ²Sugar, Max (Ed). (Louisiana State U, Medical School, New Orleans) ⁴*The adolescent in group and family therapy*. New York, NY: Brunner/Mazel, 1975. xvii, 286 p. ¹¹\$13.50.¹²

- 1—Record number.
- 2—Author(s) or editor(s). As many as four are listed; if there are more than four, the first is listed followed by "et al." Succession marks (i.e., Jr., II, III, etc) are not given.
- 3—Designation of editor.
- 4—Affiliation of first-named author/editor only.
- 5—Book title: If the book is in a foreign language, the original title is given followed by a translated title and the language of the book is indicated in parentheses.
- 6—Place of publication.
- 7—Publisher.
- 8—Year of publication.
- 9—Prepagination.
- 10—Total pagination.
- 11—Price.
- 12—Annotation occasionally follows.

BOOK CHAPTER CITATION

¹1641. ²Berkovitz, Irving H. & Sugar, Max. (U California, Los Angeles) ⁴*Indications and contraindications for adolescent group psychotherapy*. In M. Sugar (Ed), *The adolescent in group and family therapy*. New York, NY: Brunner/Mazel, 1975. xvii, 286 p. \$13.50.

- 1—Record number.
- 2—Author(s) of cited chapter. As many as four are listed; if there are more than four, the first is listed followed by "et al." Succession marks (i.e., Jr., II, III, etc) are not given.
- 3—Affiliation of first-named author only.
- 4—Chapter title.
- 5—Referral to the whole book and its bibliographic data.

CONTENT CLASSIFICATION: *PA* has subsections for some of the 17 major classification categories. These are displayed in the Table of Contents and are designed to group all abstracts relevant to a narrower topic than the major categories under a single heading. Abstracts that are relevant to a major category but not to any of the subsections are listed first and followed by abstracts that are relevant both to a major category and also to the subsections. It is expected that this will help readers locate material related to their interests more quickly.

ABBREVIATIONS: In addition to commonly understood abbreviations* (including all units of measurement, educational degrees, standard statistical abbreviations, and standard Latin and reference terms), standard abbreviations used in *Psychological Abstracts* records are:

CA	= chronological age
CNS	= central nervous system
CR	= conditioned response
CS	= conditioned stimulus
DRL	= differential reinforcement of low rates (of responding)
E	= experimenter
ECS	= electroconvulsive shock
EKG	= electrocardiogram (graph)
EMG	= electromyogram (graph)
EPSP	= Edwards Personal Preference Schedule
Exp	= experiment
FI	= fixed interval (reinforcement)
FR	= fixed ratio (reinforcement)
GPA	= grade point average
GSR	= galvanic skin response
ip	= intraperitoneal (ly) (injections)
iv	= intravenous (ly) (injections)
MA	= mental age
MAO	= monoamine oxidase
MMPI	= Minnesota Multiphasic Personality Inventory
NREM	= nonrapid eye movement
REM	= rapid eye movement
ROTC	= Reserve Officer's Training Corps
RT	= reaction time
S	= subject
SVIB	= Strong Vocational Interest Blank
TAT	= Thematic Apperception Test
UCR	= unconditioned response
UCS	= unconditioned stimulus
US	= United States of America
USSR	= Union of Soviet Socialist Republics
VI	= variable interval (reinforcement)
VR	= variable ratio (reinforcement)
WAIS	= Wechsler Adult Intelligence Scale
WISC	= Wechsler Intelligence Scale for Children
16 PF	= Sixteen Personality Factor Questionnaire

Computer languages and computer names will also be used without definition, e.g., ALGOL, COBOL, FORTRAN, IBM 360.

Language abbreviations used after translated titles are:

Afri	= Afrikaans	Iran	= Iranian
Alba	= Albanian	Ital	= Italian
Arab	= Arabic	Japn	= Japanese
Bulg	= Bulgarian	Lith	= Lithuanian
Chin	= Chinese	Norg	= Norwegian
Czec	= Czech	Polh	= Polish
Danh	= Danish	Port	= Portuguese
Duth	= Dutch	Romn	= Romanian
Finn	= Finnish	Russ	= Russian
Flem	= Flemish	Sloe	= Slovene
Fren	= French	Slok	= Slovak
Geor	= Georgian	Span	= Spanish
Germ	= German	Srcc	= Serbo-Croatian
Grek	= Greek	Swed	= Swedish
Hebr	= Hebrew	Turk	= Turkish
Hung	= Hungarian	Ukri	= Ukrainian
		Yugo	= Yugoslavian

PSYCHOLOGICAL ABSTRACTS

Volume 55

January 1976

Number 1

GENERAL PSYCHOLOGY

1. ———. [Catalogue des Archives Jean Piaget, Université de Genève, Suisse. (Catalog of the Jean Piaget Archives, University of Geneva, Switzerland.)] (Fren) Boston, MA: G. K. Hall, 1975. xvii, [400] p. \$35. —Presents a booklet which introduces and describes a reference catalog containing a bibliography of the works of Piaget from 1907 to 1974, the works of some of Piaget's immediate collaborators, and the secondary literature stimulated by Piaget's work.

2. deMause, Lloyd. **Psychohistory: The new science.** *History of Childhood Quarterly: The Journal of Psychohistory*, 1975(Sum), Vol 3(1), 123-126. It became evident a few yrs ago that a new discipline, psychohistory, was about to be born. It has its roots in what formerly was called "applied psychoanalysis." The new discipline works on 3 levels: the history of childhood, psychobiography, and group psychohistory. Psychohistorians, in their intense concentration on psychic reality, leave the determination of the physical reality of history to traditional historians.—R. D. Nance.

3. Monaco, Paul. (U Texas, Dallas) **Psychohistory: Independence or integration?** *History of Childhood Quarterly: The Journal of Psychohistory*, 1975(Sum), Vol 3(1), 126-130.—Posits that current academic scholasticism and overspecialization derive, not so much from an absence of "new beginnings," as from a failure to pursue them. Psychohistory's present lack of a rigid doctrinal system is one of its strengths. It is noted that in explaining motivation, psychohistory has come in for much of the criticism which traditionalists direct at it. Psychohistory does, however, have a branch which concerns itself more with the how than the why. This branch could be called "descriptive" psychohistory.—R. D. Nance.

4. Sambin, Marco. (U Padova, Istituto di Psicologia, Italy) **Angular margins without gradients.** *Giornale Italiano di Psicologia*, 1974(Dec), Vol 1(3), 355-361.

Discusses some displays, within the phenomenon of margins without gradients, which can induce angular margins. There are 2 solutions suggested: the first is based on the typical resistance of figures to intrusion; the 2nd is supported by the hypothesis about the homogeneity of field forces induced by terminal points of straight lines. (Italian summary)—*Journal abstract*.

Parapsychology

5. Morris, J. D.; Roll, W. G. & Morris, R. L. **Abstracts and papers from the Seventeenth Annual Convention of the Parapsychological Association, 1974.** *Research in Parapsychology*, 1974, 1974, 9-265.—Among the topics

discussed are energy focusing and lingering effects in poltergeist cases, ESP and "normal" cognition, ethical issues confronting parapsychologists, and biofeedback and pattern self-regulation in biological perspective.

History & Philosophies & Theories

6. Allwohn, A. [The ethos of shadow acceptance.] (Germ) *Analytische Psychologie*, 1975, Vol 6(1), 57-63. —According to E. Neumann, the problem of evil can only be solved if the old Judeo-Christian ethic is replaced by a new one, accepting the personal shadow as part of the shadow of mankind. Jung maintains that the condition for this is to love the sinner, that is, oneself. This theme is illustrated in a case example.—S. D. Babcock.

7. Eissler, K. R. **On mis-statements of would-be Freud biographers with special reference to the Tausk controversy.** *International Review of Psycho-Analysis*, 1974, Vol 1(4), 391-414.—Discusses an attack on Freud by P. Roazen (1969) in which Freud is asserted to have been responsible for the suicide of Victor Tausk, through Freud's refusal to analyze him. Examples of authors' animosity or malevolence toward Freud are presented and considered to reflect an inner resentment against Freud as a person. One source of this resentment arises from a defensive reaction to an encounter with self when reading Freud's works. (40 ref)—R. Tomasko.

8. Freeman, Michael. (U Essex, England) **Sociology and utopia: Some reflections on the social philosophy of Karl Popper.** *British Journal of Sociology*, 1975(Mar), Vol 26(1), 20-34.—Discusses Popper's critique of historicism and his belief that a commitment to science also entails a commitment to rationality and criticism, and therefore to liberal democracy. Popper's attacks on utopianism and historicism are criticized as violating his own principles of logic and science.—R. P. Abeles.

9. Gruen, Arno. (Private practice, New York, NY) **On evil, psychosis and conscience.** *Review of Existential Psychology & Psychiatry*, 1974, Vol 13(1), 88-97.—Discusses the anatomy of evil in terms of the development or distortion of autonomy. A self rooted in autonomy cannot live with destructiveness, and the lack of an autonomous self provides the genesis of violence. The ability to turn against oneself is discussed, and the repressive side of socialization is seen as a source of violence. A psychotherapy limited to the oedipal situation, without considering the patient's helpfulness resulting from an aborted struggle for autonomy, will bring about the monstrosity of an ambition freed from all restraint.—R. Tomasko.

10. House, J. D. (U Calgary, Canada) **A note on George Herbert Mead's social psychology.** *Canadian*

Psychological Review, 1975(Jul), Vol 16(3), 205-207.—Attempts to contribute toward the bridging of a communication gap between psychological and sociological approaches to social psychology. Implicitly questioning the dominant view of G. H. Mead's (1922, 1934) work among contemporary sociologists, it outlines the major ideas of this founding father of symbolic interactionist social psychology in behaviorist terms. This interpretation suggests that Mead's theory of human psychology is compatible with and may potentially contribute toward the recent growth of the cognitive approach to social psychology among psychologists.—*Journal abstract*.

11. Kadinsky, David. [C. G. Jung's concept of the symbol.] (Germ) *Analytische Psychologie*, 1975, Vol 6(1), 1-11.—Explores the significance of the symbol through the writings of Jung. Jung's courage caused him to leave the comparative security given by a nearly concrete concept of the determinants of the unconscious to discern their accountability for the choice of symbols. He revealed intentionality in the symbol and led to the discernment of the psychoid archetype, a principle of orderedness affecting the physical as well as the psychic world. Jung's concept corresponds closely with those of modern physics.—S. D. Babcock.

12. Kloskowska, Antonina. (U Lodz, Poland) [The status of social communication theory.] (Polh) *Studia Socjologiczne*, 1974, Vol 4(55), 113-129.—Reviews the history of the role and function of communication theory in psychology and sociology.—H. Kaczkowski.

13. Kressel, Kenneth. (Rutgers State U) Kurt Lewin and American psychology: The "outsider" and intellectual leadership. *Groups: A Journal of Group Dynamics & Psychotherapy*, 1974-75, Vol 6(1), 37-42.—Suggests that the extent and nature of Lewin's influence on American psychology is partially due to the paradoxical nature of his psychological makeup. The ways his background in pre-war Germany and as a refugee scholar in the US had sensitized him to the dangers of social isolation are noted. His approach to psychology and several specific aspects of his career are discussed in terms of his trying to overcome being in a psychologically marginal position.—R. Tomasko.

14. McLeod, Hugh N. (Lakehead U, Thunder Bay, Canada) The king with no clothes. *Canadian Psychological Review*, 1975(Jul), Vol 16(3), 208-209.—Posits that a theory is required which treats of generosity, love, joy, sadness, and the willingness to die. Theories which appreciate the thrill and exuberance of life as well as the shadows are required. It is stated that we have a hoard of molecular theories which pretend to molar status. We are as a King with no clothes.

15. Peters, Jerome. (Rush-Presbyterian St Luke's Medical Ctr, Chicago, IL) An eclectic perspective in neuropsychiatry: A synthesis of the views of Hobbes, Freud, and the phenomenologists. *Acta Psychiatrica Belgica*, 1974(Mar), Vol 74(2), 105-118.

16. Szacki, Jerzy. (U Warsaw, Poland) [The sociology of W. I. Thomas.] (Polh) *Studia Socjologiczne*, 1974, Vol 4(55), 47-81.—Reviews Thomas's work from the perspective of social psychology. His major work on Polish immigrants (with Znaniecki) receives extended coverage.—H. Kaczkowski.

Research Methods & Apparatus & Computer Applications

17. Bernstein, Theodore. (U Wisconsin, Madison) Electrical safety in aversive conditioning of humans. *Behavioral Engineering*, 1975(Win), Vol 2(2), 31-34.—Describes the fundamentals of the conventional 60-Hz, 120/240 V electrical systems used in most laboratories and homes. Protection from lethal shocks is discussed, and the most common problems associated with aversive conditioning. Shock effects for different levels of the 60-Hz electrical system are listed for ventricular fibrillation, respiratory arrest, asphyxia, threshold of perception, and let-go current. Safe levels are also indicated.—*Journal abstract*.

18. Blaney, Paul H. (U Texas, Austin) The use of medical controls in research with psychiatric populations. *Comprehensive Psychiatry*, 1975(Jul-Aug), Vol 16(4), 375-377.—Examines selected studies which lend support to the argument that the use of medical controls in studies with psychiatric populations may provide misleading results and lead to incorrect inferences.

19. Brown, John S.; Burton, Richard R. & Bell, Alan G. (Bolt Beranek & Newman, Inc, Computer Science Div, Cambridge, MA) SOPHIE: A step toward creating a reactive learning environment. *International Journal of Man-Machine Studies*, 1975(Sep), Vol 7(5), 675-696.—Describes a fully operational assisted-instruction-computer-assisted-instruction system which incorporates artificial intelligence techniques to perform question answering, hypothesis verification, and theory formation activities in the domain of electronic troubleshooting. Much of SOPHIE's (SOPHisticated Instructional Environment) logical or inferencing capabilities is derived from uses of simulation models in conjunction with numerous procedural specialists. The system also includes a highly tuned structural parser for allowing the student to communicate in natural language. Although the system is extremely large, it is sufficiently fast to be thoroughly exercised in a training or classroom environment.—*Journal abstract*.

20. Byrne, John. (Columbia U, Coll of Physicians & Surgeons) A feedback controlled stimulator that delivers controlled displacements or forces to cutaneous mechanoreceptors. *IEEE Transactions on Bio-Medical Engineering*, 1975(Jan), Vol 22(1), 66-69.—Describes an instrument, based on a design by the root locus method and utilizing both displacement and force feedback, which can be used to deliver either controlled displacement or controlled force stimuli to the skin. Examples are given of applications of the stimulator operated in each of its 2 modes.—*Journal abstract*.

21. Cherulnik, Paul D. et al. (U Maine, Orono) An independent validation of the lost-letter technique. *Journal of Social Psychology*, 1975(Aug), Vol 96(2), 299-300.—Conducted a replication of a lost letter study to assess attitudes of people in small coastal towns in Maine toward the development of oil refining facilities. Results support the validity of the lost letter technique as a measure of attitudes toward political and social issues and demonstrate that it can be used reliably in sparsely populated rural areas.

22. Hammer, August. (U Fribourg, Fachbereich Experimentielle Psychologie, Switzerland) [A taxonomy

of ceiling effects.] (Germ) *Zeitschrift für Entwicklungspsychologie und Pädagogische Psychologie*, 1974, Vol 6(3), 207-223.—Proposes a classification of ceiling effects divided into (a) technical ceilings consisting of scale range restriction, nonlinearity of the scale, and time limiting; and (b) psychological ceilings involving over-learning asymptote, developmental asymptote, and phasic growth. The taxonomy is aimed at promoting the ease with which ceiling effects and appropriate methodological measures can be matched. Possible values of the taxonomy consist of (a) practical emphasis on assumptions of various corrective measures, which increases the likelihood that appropriate research questions are asked in evaluating psychological ceilings; (b) allowance for confounding effects; and (c) optional provision of a special formula for correction of the attenuation through unreliability in the case of gain correlations. It is suggested that E's seeking to deal with ceiling effects should find this taxonomy of value. (English summary) (41 ref)—R. Scott.

23. Gauthier, Gabriel M. & Voile, Michel. (U Provence, Lab de Psychophysiologie, Marseille, France) **Two-dimensional eye movement monitor for clinical and laboratory recordings.** *Electroencephalography & Clinical Neurophysiology*, 1975(Sep), Vol 39(3), 285-291.—Describes a photoelectric device designed to monitor simultaneously vertical and horizontal eye movements within a 20° range. This design eliminates separate source illumination artifacts, is extremely light, preserves maximum vision field size, and appears to be easy to operate. (French summary) (17 ref)

24. Heuser, James P. (U Oregon) **The methodological adequacy of deviant behavior research: Problems and prospects for the conventional study of unconventional behavior.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1382.

25. Hunt, David E. (U Toronto, Ontario Inst for Studies in Education, Canada) **The B-P-E paradigm for theory, research and practice.** *Canadian Psychological Review*, 1975(Jul), Vol 16(3), 185-197.—Proposes K. Lewin's (1935) B-P-E formula as a paradigm for psychological theory, research, and practice. Taking explicit account of behavior, person, and environment not only permits an interactive analysis of these components, but is more in keeping with intuitive, common-sense psychology. 4 characteristics of the paradigm are described: interactive, developmental, reciprocal, and practical. The paradigm is illustrated by the Conceptual Level matching model, and its implications for the analysis of the teaching-learning process and teacher training are described. It is concluded that adoption of the new paradigm is likely to occur slowly, since it requires change in one's way of thinking away from the general-effects model to an interactive mode of thinking. (37 ref)—*Journal abstract.*

26. Jones, K. N.; Steen, J. A. & Collins, W. E. (FAA Civil Aeromedical Inst, Aviation Psychology Lab, Oklahoma City, OK) **Predictive validities of several clinical color vision tests for aviation signal light gun performance.** *FAA Office of Aviation Medicine Report*, 1975(Jan), No 75(1), 9 p.—Scores on the 1965 edition of the American Optical Company (AOC) test, Dvorine test, Farnsworth Lantern test, Color Threshold Tester,

Farnsworth-Munsell 100-Hue test, Farnsworth Panel D-15 test, and Schmidt-Haensch Anomaloscope were obtained from 137 males with color-defective vision and 128 males with normal color vision. The validity of each of these tests in predicting scores on the aviation signal light gun was assessed by using daytime and nighttime administrations of the light gun as the criteria. 2 "best sets" of plates from the AOC and Dvorine tests were selected by calculating a multiple regression equation in a stepwise manner with the nighttime and then the daytime administration of the signal light gun test as the criteria. Based on a graphic presentation of the miss and false alarm rates for each test at various possible cut scores, suggestions are made regarding the use of each test and the selection of optimal pass/fail scores. —*Journal abstract.*

27. Kauer, John S. & Shepherd, Gordon M. (Yale U, Medical School) **Olfactory stimulation with controlled and monitored step pulses of odor.** *Brain Research*, 1975, Vol 85(1), 108-113.—Describes a method of delivering odors as step pulses which are monitored at the site of stimulation. The experimental set-up consists of 3 main components: (a) an olfactometer which controls the flow rate and concentration of the stimulus; (b) a delivery system which controls the onset, duration, and termination of the stimulus; and (c) a monitoring system which measures the time course of the pulse containing the odor. Experiments carried out in salamanders immobilized with tubocurarine are reported. Odor stimuli were delivered to the exposed ventral olfactory mucosa of the nose. Preliminary results suggest that it should be possible to characterize the responses to step stimuli in terms of dynamic and static phases of the stimulation, similar to the analysis of other sensory systems.—L. Gorsey.

28. Lando, Harry A. (Iowa State U) **An objective check upon self-reported smoking levels: A preliminary report.** *Behavior Therapy*, 1975(Jul), Vol 6(4), 547-549.—Undertook a preliminary assessment of the efficacy of measures of carbon monoxide concentration as an objective check upon self-reported smoking consumption. Breath samples were taken from 20 Ss who had completed an antismoking program 2 mo previously. Ss were males and females with a mean age of 31.8 yrs whose mean baseline smoking was 30.8 cigarettes/day. Results tentatively suggest that the carbon monoxide test is a valid and nonreactive technique.—*Journal abstract.*

29. Larsson, Berni & Larsson, Inger. (School of Education, Malmö, Sweden) **Problems of computer service at the behavioral science institutes in Sweden.** *Pedagogisk-Psykologiska Problem*, 1975(May), No 271, 24 p.—Presents brief summaries from a conference in Malmö (1975) on computer use in behavioral research, during which 4 main subjects were discussed: program service, computer service, the new law concerning analyzing information by computer about identified individuals, and problems concerning filing of research data.

30. Lu, Ching-ming. [Truncation error and the selection of statistical formula in computer operation.] (Chin) *Bulletin of Educational Psychology*, 1974(Jun), Vol 7, 47-52.—Examined the existence of truncation errors in computer operation by using 8 groups of numerical

data varying in length. The IBM 360 computer was used. Results show that when the number of digits was large, using the definition formula in both single and double precision floating point modes, a more precise output would be obtained than when using the computation formula. When the number of digits was small, there were no truncation errors.—*Journal abstract.*

31. Luccio, Riccardo. (U Milano, Istituto di Psicologia della Facoltà Medica, Italy) [The rights of subjects in psychological experimentation.] (Ital) *Giornale Italiano di Psicologia*, 1975(Apr), Vol 2(1), 1-18.

32. National Academy of Sciences. (Washington, DC) **Experiments and research with humans: Values in conflict.** Washington, DC: National Academy of Sciences, 1975. vi, 234 p.—Presents papers on the concerns and problems involved in the use of human subjects in research, including the perspectives of biomedical research, the individual risks vs societal benefits, and regulatory, judicial, and legislative processes involved. The moral issues in research on the fetus, the child, the prisoner, the poor, and the military are discussed.

33. Nowakowska, Maria. (Polish Academy of Sciences, Inst of Praxiology, Warsaw) **Epidemical spread of scientific objects: An attempt of empirical approach to some problems of meta-science.** *Theory & Decision*, 1973(Mar), Vol 3(3), 262-297.—Considers problems of prediction of spreading out of scientific objects, such as theories, hypotheses, and methods. 2 models for predicting changes in number of publications dealing with the given subjects in consecutive years are suggested; these models are based on the theory of epidemics. (54 ref)

34. Seifert, Th. (Forschungsstelle für Psychotherapie, Stuttgart, W Germany) [Necessity and possibility of scientific methods in the field of analytical psychology.] (Germ) *Analytische Psychologie*, 1975, Vol 6(1), 26-44.—Asserts that analytical psychology is a part of empirical psychology, and its inclusion in the "Geisteswissenschaft" would lose scientific acknowledgement and increase unproved hypotheses. It is shown that Jung uses the logical methods of empirical science to prove his ideas. K. R. Papper's concept of scientific research is considered partly relevant for analytical psychology. It is noted that Jung always started with an idea which was controlled by empirical methods, following the methodological standards of his time.—S. D. Babcock.

35. Shine, Lester C. (Texas A&M U) **Five research steps designed to integrate the single-subject and multi-subject approaches to experimental research.** *Canadian Psychological Review*, 1975(Jul), Vol 16(3), 179-184.—Presents 5 steps which integrate the single-S and multi-S approaches to experimental research. The 5 steps represent Probing, Verification and Generalization, Detection, Identification, and Control functions, respectively. In Step 1, the single-S approach is used to quickly determine important repeatable variables. In Step 2, the multi-S approach is used to verify and generalize Step 1 results. Nonrepeatable variables are studied in Step 2. In Step 3, S effects are tested to detect unknown systematic variation. In Step 4, significant S effects are examined closely to try to identify concomitant variables. In Step 5, identified concomitant variables are brought under control. (18 ref) —*Journal abstract.*

36. Stevenson, P. W. (U Essex, Colchester, England) **An adaptive speech audiometer.** *International Journal of Man-Machine Studies*, 1975(Sep), Vol 7(5), 661-674.—Outlines the operation and some applications of an automatic audio visual system for the assessment of an S's phonemic discrimination ability based on a 2-alternative forced-choice response situation. Data on response times and hemispheric specialization for speech in normal Ss, phonemic discrimination difficulties in the elderly, and the assessment of hearing aids are referred to as examples of application of the system. (21 ref) —*Journal abstract.*

PSYCHOMETRICS

37. Brightman, Donald & Raymond, Beth. (Hofstra U) **The effects of task ambiguity and expectancy control groups on the experimenter bias effect.** *Journal of Social Psychology*, 1975(Aug), Vol 96(2), 277-287.—Studied the effects of task ambiguity and expectancy control groups on the experimenter bias effect (EBE). 270 undergraduates scored 30 test protocols (drawings) from the Vane Kindergarten Test under 3 expectancy and 3 ambiguity conditions (Ss were told the drawings were from accelerated, regular, or slow classes and given 6, 3, or 0 examples). An Actual State condition was also included. Results indicate that the main effects of Induced Expectancy, Ambiguity, and Actual State (actual pre-established score differences on the test protocols), as well as the Ambiguity \times Induced Expectancy and Ambiguity \times Actual State interactions, were all significant. The Ambiguity \times Induced Expectancy interaction indicated that induced expectancy had an effect only when Ss were given ambiguous criteria with which to score the test protocols. The Ambiguity \times Actual State interaction indicated that the high ambiguity condition resulted in inaccurate scoring, while low and medium ambiguity did not. Finally, the main effect of induced expectancy was small when compared to the Actual State effect, suggesting that some of the experimenter bias effects in the literature may have been obtained because basically unscorable stimuli were used. (17 ref) —*Journal abstract.*

38. Buss, Allan R. (U Alberta, Edmonton, Canada) **An inferential strategy for determining factor invariance across different individuals and different variables.** *Multivariate Behavioral Research*, 1975(Jul), Vol 10(3), 365-371.—Outlines different methods for indirectly establishing factor invariance across 2 situations, both involving different individuals and different situations. The procedures involve a planned data-gathering strategy consisting of at least 2 different groups, each receiving 2 different test batteries. The recommended strategy involves a combination of L. R. Tucker's (1958) interbattery technique and congruence measures. Some of the implications of the concept of factor invariance are briefly discussed. It is concluded that statistical measures of factor invariance are a necessary but not a sufficient condition for the psychological invariance of constructs accounting for observed differences. —*Journal abstract.*

39. Conrey, Andrew L. & Backer, Thomas E. (U California, Los Angeles) **Detection of faking on the**

Comrey Personality Scales. *Multivariate Behavioral Research*, 1975(Jul), Vol 10(3), 311-319.—The ability of Ss to fake responses on personality tests under various experimental conditions has been established in several studies, including those involving the Comrey Personality Scales (CPS). Evidence is presented in the present study regarding the potential of several techniques for detecting faked CPS test records, along with a further demonstration of the extent to which the CPS can be faked. 5 groups of test records were used: 4 were from 2 sets of university student Ss ($N = 106$), with one test record completed under normal conditions and the other under instructions to deliberately "fake good." The final group of CPS records was from a set of 95 police officer candidates. Several possible faking predictor scores were related to a continuously measured index of faking based on differences between "faked" and "normal" records and also to a dichotomous criterion of faking. Results of a correlational analysis show that the best predictor of faking on the Comrey Personality Scales is a total summary score obtained by adding up all 10 CPS scale scores.—*Journal abstract*.

40. Loevinger, Jane. (Washington U, St Louis) **Issues in the measurement of moral development.** *Proceedings of the ETS Invitational Conference*, 1974, 1974, 57-68.—Discusses psychometric problems encountered in connection with the stage-sequence conception of moral development (or ego development which is equivalent to moral development). The rules and procedures used in developing a measure of ego development are described, and differences between stage-sequence models and ability-type measurement models are discussed. It is suggested that measurement can help to advance theory.—*H. E. Yaker*.

Test Construction & Validation

41. Abbott, Robert D. (California State U, Fullerton) **Improving the validity of affective self-report measures through constructing personality scales unconfounded with social desirability: A study of the Personality Research Form.** *Educational & Psychological Measurement*, 1975(Sum), Vol 35(2), 371-377.—Investigated D. N. Jackson's Personality Research Form (PRF) at the item and scale level with respect to the degree to which responses are confounded by social desirability. 100 students rated the Social Desirability scale values (D. B. Cruse) of the PRF (Form AA). 218 Ss responded to the PRF (Form AA), the MMPI Social Desirability scale, and Welsh's Repression Scale. Jackson's usage of the differential validity index resulted in large proportions of items neutral in social desirability and scales relatively balanced in the number of items keyed for socially desirable and socially undesirable responses. These item and scale characteristics, the low correlations of PRF trait scales with social desirability scale scores, and the results of a component analysis of PRF trait scales and social desirability scales support the discriminant construct validity of the PRF trait scales with respect to social desirability.—*Journal abstract*.

42. Bailey, Douglas B. (U Wisconsin) **The development of a semantic differential instrument for measuring principal semantic dimensions of meaning which adults ascribe to religious and theological terminology.**

Dissertation Abstracts International, 1973(Aug), Vol 34(2-A), 630-631.

43. Baumann, U.; Angst, J.; Henne, A. & Muser, F. E. (Psychiatrische Universitätsklinik Zürich, Switzerland) **[The Gray-Wheelwright Test.]** (German) *Diagnostica*, 1975, Vol 21(2), 66-83.—Evaluates the 81-item German version of the Gray-Wheelwright test, a self-report inventory designed to measure introversion vs extraversion, thinking vs feeling, and intuition vs sensation. Gray-Wheelwright test and Freiburger Personality Inventory data, based on 297 males and 349 females, generally between 15 and 30 yrs old, suggest that the 1st scale is reliable and valid, that the 2nd is characterized by unsatisfactory test statistics, and that the 3rd distinguishes, as expected, between professional groups and merits further refinement.—*M. Morf*.

44. Butler, Alan C. (U Maine) **The child health questionnaire: Preliminary data.** *Psychology in the Schools*, 1975(Apr), Vol 12(2), 153-160.—Describes a short psychological health questionnaire for children, based on a theoretical model of health which assumes that mental health is a creative growth-oriented process. The reliability and validity of the questionnaire are given.—*H. Kaczkowski*.

45. Campbell, David P. (U Minnesota) **"Give me one of those interest tests so I can see what I should be."** *Proceedings of the Invitational Conference on Testing Problems*, 1973, 1973, 9-13.—Advocates developing feedback methods so that test scores can be supplied to test takers. When this was done with interest inventories, people used their results for many different purposes.

46. Gambrill, Elleen D. & Richey, Cheryl A. (U California, School of Social Welfare, Berkeley) **An assertion inventory for use in assessment and research.** *Behavior Therapy*, 1975(Jul), Vol 6(4), 550-561.—The Assertion Inventory is a 40-item self-report measure which permits respondents to note for each item their degree of discomfort, their probability of engaging in the behavior, and situations they would like to handle more assertively. Normative data from a college population as well as data from women taking part in assertion training groups are included. A total of 676 males and females (18-53 yrs old) were involved. Comparative distributions of these populations over 4 combinations of response probability and discomfort scores are presented as well as reliability and validity data. The value of the inventory both in clinical settings and in research is discussed.—*Journal abstract*.

47. Hockman, Elaine M. (U Michigan) **The validation of interindividual and intraindividual change measures.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 172-173.

48. Joesting, Joan. (Salisbury State Coll) **Correlations among different forms of the Quick Test.** *Psychological Reports*, 1975(Aug), Vol 37(1), 285-286.—Administered all 6 individual and 3 group forms of the Quick Test to 57 undergraduates. High significant Pearson correlations among raw scores and IQs suggest that these alternate forms give similar assessments.—*Journal abstract*.

49. Kline, Paul. (U Exeter, Washington Singer Labs, England) **Pinmen in India.** *Journal of Social Psychology*, 1975(Aug), Vol 96(2), 289-290.—Administered the Pinmen Test, which consists of 10 cards portraying stick

figures engaged in some activity representative of one of H. A. Murray's needs, to 24 male and 29 female Indian postgraduate students. Limitations of the Pinmen Test for this population are discussed (e.g., some Ss misinterpreted the cards), and the need for exercising caution when interpreting cross-cultural findings is emphasized.

50. Klinedinst, James K. (Indiana U, PA) **Multiphasic measurement of child personality: Construction of content scales using the Personality Inventory for Children.** *Journal of Consulting & Clinical Psychology*, 1975(Oct), Vol 43(5), 708-715.—The application of objective test methodology to child personality is seen as having potential for improvement of similar problems in child care or treatment settings such as mental health centers, hospitals, and schools. Intuitive and statistical (internal consistency) procedures were combined to construct 10 scales for measuring child personality: Somatic Concern, poor Family Relations, Asocial Behavior, Aggression, poor Intellectual-Physical Development, Withdrawal, Anxiety, Reality Distortion, Excitement, and poor Social Skills. 4 independently collected samples were used in the construction of the content scales. These samples were designated as clinic ($n = 73$), psychotic ($n = 60$), normative ($n = 2,386$), and general abnormal ($n = 198$). A 5th sample, normal contrast, was drawn from the normative sample ($n = 600$). Ss were 5-16 yrs old. The scales were judged to be internally consistent, potentially applicable to clinical decision making, and to require empirical validation. (18 ref)—*Journal abstract*.

51. Kohn, Paul M. & Annis, Helen M. (York U, Downsview, Canada) **Validity data on a modified version of Pearson's Novelty Experiencing Scale.** *Canadian Journal of Behavioural Science*, 1975(Jul), Vol 7(3), 274-278.—Describes the validation of a modified version of Pearson's (1970) Novelty Experiencing Scale, using 232 female and 198 male 12th graders. Measures of external sensation-seeking, internal cognitive experience-seeking, internal sensation-seeking, and external cognitive experience-seeking all proved reliable, and factorially homogeneous. Intercorrelations among the measures, and correlations against Pearson's Desire-for-Novelties Scale resembled previous findings by P. H. Pearson (1970 and 1971). 3 predicted sex differences occurred (plus one about which no prediction was made). (French summary)—*Journal abstract*.

52. Kury, Helmut & Bäuerle, Siegfried. (Max-Planck-Institut für ausländisches und internationales Strafrecht, Freiburg, W Germany) **[A contribution to the standardization of the Freiburger Personality Inventory: 13 to 15 year old pupils.]** (Germ) *Diagnostica*, 1975, Vol 21(2), 53-66.—Presents new norms for the 12 scales of the Freiburger Personality Inventory obtained from 236 male and 255 female 13-15 yr olds. Means differing significantly from those obtained from the adult standardization populations are reported for 9 scales, and sex differences similar to those obtained from the adults are presented for the new standardization sample.—*M. Morf*.

53. Kuusinen, Jorma & Nystedt, Lars. (U Jyväskylä, Finland) **The convergent validity of four indices of cognitive complexity in person perception: A multi-index multimethod and factor analytical approach.**

Scandinavian Journal of Psychology, 1975, Vol 16(2), 131-136.—Used an application of the D. T. Campbell and D. W. Fiske (see PA, Vol 34:103) multimethod-multitrait analysis and factor analysis to study the convergent validity of the following indices of cognitive complexity: J. Bieri's (1955) index, J. S. Vannoy's (1965) interaction variance measure, number of factors, and 1st factor percentage. Ss were 36 undergraduates. In the analysis the individual constructs elicited by G. A. Kelly's Role Construct Repertory Test were contrasted with 2 sets of provided constructs, namely semantic differential and personality differential scales. Results indicate that the convergent validity of the indices over construct type was low and that the construct type had an effect upon the intercorrelations of different indices of cognitive complexity. (17 ref)—*Journal abstract*.

54. Leonetti, Robert. (New Mexico State U) **A primary self-concept scale for Spanish-surnamed children, grades K-4.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 193.

56. Megargee, Edwin I. & Cook, Patrick E. (Florida State U) **Negative response bias and the MMPI Overcontrolled-Hostility scale: A response to Deiker.** *Journal of Consulting & Clinical Psychology*, 1975(Oct), Vol 43(5), 725-729.—Tested the hypothesis of T. E. Deiker (see PA, Vol 52:7935) that "naysaying" accounts for the MMPI Overcontrolled-Hostility (O-H) scale's ability to discriminate among criminal groups differing in their propensity for violence. 4 balanced O-H scales were constructed by adding "true" or deleting "false" keyed items according to different selection strategies. The 2 extended scales discriminated cross-validation groups as well or better than the regular imbalanced O-H scale, and the shortened scales were significant or approached significance in 3 of 4 comparisons. It is concluded that the validity of the O-H scale is not dependent on naysaying. (22 ref)—*Journal abstract*.

57. Pam, Alvin; Plutchik, Robert & Conte, Hope R. (Albert Einstein Coll of Medicine, Yeshiva U) **Love: A psychometric approach.** *Psychological Reports*, 1975(Aug), Vol 37(1), 83-88.—Developed a new psychometric instrument, the Love Scale, for measuring feelings and attitudes associated with being in love. A series of items was constructed to provide measures of 5 components assumed on the basis of philosophical speculation and previous research to be basic to the love experience: respect, congeniality, altruism, physical attraction, and attachment. Data from 139 25-28 yr old college students who described themselves as either being in love, having a dating relationship, or only friendly with a member of the opposite sex show that both the total and the subscale scores proved to be highly reliable. The significant differences between love dating, and friendship groups clearly indicated that the love relationship can be distinguished empirically from that of dating or friendship. Most important to a love relationship appeared to be attachment and physical attraction.

—*Journal abstract*

58. Pearlman, Virginia H. (Purdue U) **Development and validation of two companion instruments for measuring the quality of openness: The O. M. semantic differential and O. M. graphic.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 139.

59. Pennington, John A. (Ohio State U) **The musical peak experience.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 601-602.

60. Perry, Arnon & Cunningham, William H. (U Texas, Graduate School of Business, Austin) **A behavioral test of three F subscales.** *Journal of Social Psychology*, 1975(Aug), Vol 96(2), 271-275.—Tested the validity of 3 of the 9 California F Scale subtests using a behavioral criterion. The 3 subscales were Conventionalism, Authoritarian Submission, and Superstition and Stereotype. The behavioral criterion consisted of having the 440 Israeli undergraduate Ss receive a letter ordering the student to appear for testing. The 3 subtests were then administered to the 120 Ss who reported to take the test and later to 110 undergraduates who did not appear. Lutterman's Social Responsibility Scale was also given. Neither the 3 subtests nor the Social Responsibility Scale differentiated those Ss who reported for testing as requested from those who did not. Reasons for the negative results include (a) the tests may be culture bound and not applicable for use in other societies, (b) the behavioral manipulation may not have represented an authoritarian act to the Ss, or (c) the subtests do not measure what they are supposed to measure (i.e., an authoritarian-submissive trait).—L. Gorsey.

61. Pomerantz, Michael & Schultz, Charles B. (U Connecticut) **The reliability and validity of two objective measures of achievement motivation for adolescent females.** *Educational & Psychological Measurement*, 1975(Sum), Vol 35(2), 379-386.—Revised 2 measures of motive to succeed, for administration to 71 female 9th graders. Scores on H. J. Herman's Prestatie Motivatie Test (PMT) yielded a high degree of internal consistency, comparable to that obtained with males, which was greater than that found for scores on the present version of A. Mehrabian's Resultant Achievement Motivation (RAM) Test. In separate validation analyses, scores on the PMT correlated positively and substantially with each of 2 measures of school achievement and with questionnaire data on school-related attitudes and behavior. Although the correlations of the RAM scores with achievement measures were in the same direction, they were weaker than those for the PMT scores. The relationships between the 2 measures of motive to succeed and various internal causal ascriptions were different and low for the 2 instruments. (17 ref)—*Journal abstract*.

62. Shimoyama, Takeshi. (Tokyo Gakugei U, Japan) **A validity study of a scale to measure achievement motivation.** *Japanese Psychological Research*, 1974(Dec), Vol 16(4), 197-204.—Developed a 32-item measure for the assessment of achievement motivation in junior and senior high school students and in college students. 3 separate factor analyses were performed, using data from a total of 121 junior high school, 227 high school, and 215 college students. Results show the following: (a) Factor structures of achievement motivation tended to change from unidimensional to multidimensional

through development from junior high school age to college age. (b) Although positive relations were obtained on the whole between achievement motivations and task performances, some exceptional results which somewhat fitted with the Yerkes-Dodson law were shown in Ss with the highest motivation on the intermediate task. (c) In Ss with moderately high motivation, results consistent with J. W. Atkinson's theory (see PA, Vol 33:3029) on the relationship between performances and task difficulties were obtained. (17 ref)—*Journal abstract*.

64. Towne, Douglas C. (Cornell U) **Influences exerted upon subject responses by the response scale structural elements of attitude scales.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 627.

65. Tuttle, Thomas C.; Gould, R. Bruce & Hazel, Joe T. **Dimensions of job satisfaction: Initial development of the Air Force Occupational Attitude Inventory.** *US AFHRL Technical Report*, 1975(Jun), No 75-1, 34 p.—Describes the initial development of the Air Force Occupational Attitude Inventory. From a selective review of studies that ascribed to a multi-faceted approach, several categories or content areas were identified. An extensive item pool was prepared and reviewed by judges to provide information regarding item-category agreement, item ambiguity, and item redundancy. The revised version of the inventory consisted of 348 items distributed across 35 facets. An 8-point bipolar rating scale without a neutral point was developed for rating the items. Details regarding the final version of the inventory booklet, suitable for administration to airmen, are provided. The entire listing of 348 items and descriptions of the 35 categories are included in the report for possible use of other researchers. Subsequent actions and future uses of the Occupational Attitude Inventory are discussed. (30 ref)—*Journal abstract*.

66. Tzeng, Oliver C. (U Illinois) **Reliability and validity of semantic differential E-P-A markers for an American English representative sample.** *Psychological Reports*, 1975(Aug), Vol 37(1), 292.—Compared possible age and sex differences in evaluation (E), potency (P), and activity (A) dimensions of 15 bipolar adjective semantic differential markers for 25 concepts. Data from 40 adults strongly support the high stability and reliability of factor loadings of the markers and the generality (validity) of the E-P-A constructs.

67. Ullrich, R. & Ullrich de Muynck, Rita. (Max-Planck-Inst für Psychiatrie, Munich, W Germany) **[The Inventory of Emotions: Structure and factor-analytical examination of stress-induced responses.]** (Germ) *Diagnostica*, 1975, Vol 21(2), 84-95.—Describes the construction and evaluation of an inventory of emotions (*das Emotionalitätsinventor*) designed to assess emotional reactions in experimental situations. 7 10-item scales designed to measure psychomotor anxiety, vegetative anxiety, psychic anxiety/threat, inhibition, exhaustion, aggression, and depression were administered to a

normal, a threatened, and an exhausted sample. Factor-analytical data for each sample, yielding 5 homogeneous scales clearly related to the preliminary scales, are reported.—*M. Morf.*

68. van Hagen, John & Kaufman, Alan S. (San Francisco Boys' Home, CA) **Factor analysis of the WISC-R for a group of mentally retarded children and adolescents.** *Journal of Consulting & Clinical Psychology*, 1975(Oct), Vol 43(5), 661-667.—Administered the Wechsler Intelligence Scale for Children-Revised (WISC-R) to 80 retarded youngsters ranging in CA from 6 to 16 yrs. Scaled scores on the 12 tests were correlated, and the matrix was subjected to several factor-analytic techniques. The 3 factors identified for normal children in a previous study of the WISC-R (Verbal Comprehension, Perceptual Organization, and Freedom from Distractibility) also emerged for the retardates, although some differences were observed in the distractibility factor. The WISC-R factor structure for retardates was also similar to the structure of the 1949 WISC that was identified for several groups of institutionalized and noninstitutionalized retardates. Results of the studies involving the 1949 WISC are reviewed critically to help understand the implications of the present findings.—*Journal abstract.*

69. Vidler, Derek C. & Rawan, Hashim R. (Hunter Coll, City U New York) **Further validation of a scale of academic curiosity.** *Psychological Reports*, 1975(Aug), Vol 37(1), 115-118.—In a study with 611 undergraduates in a biology course, an 80-item self-report scale of academic curiosity was correlated with 5 measures of academic performance (final exam scores, Davis Reading Test scores, and English score on the Sequential Test of Educational Progress) and teachers' ratings of students' curiosity. Point biserial correlations of the items of the scale were also calculated and a factor analysis was carried out. While some support for the general validity of the scale was obtained, there is a need for further refinement in that the scale could not be considered as representative of a unitary construct and the 5 factors obtained accounted for only 24.1% of the total variance.—*Journal abstract.*

71. Wilmot, J. (U Reading, England) **Objective test analysis: Some criteria for item selection.** *Research in Education*, 1975(May), No 13, 27-56.—Discusses the use of a statistical measure, the discrimination index, as a basis for test item rejection or acceptance. The determination of the index and an example of its use are presented.

Statistics & Mathematics

72. Barcikowski, Robert S. & Stevens, James P. (Ohio U) **A Monte Carlo study of the stability of canonical correlations, canonical weights and canonical variate-variable correlations.** *Multivariate Behavioral Research*, 1975(Jul), Vol 10(3), 353-364.—Selected 8 data matrices from the literature for the canonical analyses, with the number of variables ranging from 7 to 41. Results show that the canonical correlations were very stable upon replication. Results also indicate that there is no solid

evidence for concluding that the components were superior to the coefficients, at least not in terms of being more reliable. However, the number of Ss per variable necessary to achieve reliability in detecting the most important variables, using components or coefficients, was quite large, ranging from 42/1 to 68/1.—*Journal abstract.*

73. Bird, Kevin D. (U New South Wales, Sydney, Australia) **Simultaneous contrast testing procedures for multivariate experiments.** *Multivariate Behavioral Research*, 1975(Jul), Vol 10(3), 343-351.—Argues that simultaneous test procedures associated with multivariate analysis of variance (MANOVA) provide very little power for tests of contrasts written on individual variates or on planned linear combinations of variates. Generalizations of the Scheffé, Turkey, and Bonferroni-*t* techniques are presented, each of which controls the experimentwise error rate for a particular type of partially or fully planned analysis. All 3 procedures provide more power than MANOVA tests. (15 ref)—*Journal abstract.*

74. Coombs, Clyde H. (U Michigan) **What is mathematical psychology?** *Pakistan Journal of Psychology*, 1974(Dec), Vol 7(3-4), 3-6.—Points to areas of psychology which have employed mathematics (e.g., psychophysics, learning theory, signal detectability, and decision theory). However, mathematics is considered generally useful in any area of psychology and at the interface between theory and experiment.—*M. Akhtar.*

75. Hand, Jack & McCarter, Robert E. (U South Carolina) **Two sources of univariate confidence intervals.** *Psychological Reports*, 1975(Aug), Vol 37(1), 167-169.—Suggests that one source of confidence intervals has been neglected in statistical texts written for students in the social sciences. The neglected source is a many-populations model. Differences in interpretations of the one-population and many-population intervals are presented, along with the suggestion that the many-populations model reflects more adequately the activities involved in the application of estimation procedures.—*Journal abstract.*

76. Hummel, Thomas J. & Feltoch, Paul J. (U Minnesota, Coll of Education) **Empirical sampling distributions of the product moment correlation coefficient when bivariate observations are correlated.** *Multivariate Behavioral Research*, 1975(Jul), Vol 10(3), 321-329.—Argues that in some correlational studies it is not reasonable to assume that bivariate observations are uncorrelated. An example would be a configural analysis in which two individuals are correlated across several variables. The present study was a Monte Carlo investigation of the robustness of techniques used in judging the magnitude of a sample correlation coefficient when observations are correlated. Empirical distributions of *r*, *t*, and Fisher's *z* were generated. Patterns of correlation were found which caused error rates to be as high as .20 when the nominal alpha was .05. A technique for controlling error rates in certain situations is suggested.—*Journal abstract.*

77. Jackson, Douglas N. (U Western Ontario, London, Canada) **Multimethod factor analysis: A reformulation.** *Multivariate Behavioral Research*, 1975(Jul), Vol 10(3), 259-275.—Proposes a method for the evaluation of the

degree to which trait measures show stability across diverse methods of measurement. Each monomethod block is separately factored and orthogonally rotated so that only 1 trait measure is highly loaded on a given dimension. The component score intercorrelation matrix is computed implicitly, and this matrix is refactored and rotated by varimax. The technique is illustrated using multitrait-multimethod matrices from personality assessment, which yield trait-specific factors. By reversing the procedure and separately factoring monotrait-heteromethod blocks followed by the refactoring of implicit component scores, it is demonstrated that method factors may be isolated. (21 ref)—*Journal abstract*.

78. Khan, Jahangir. (U Karachi, Pakistan) **Causal models in data discrepancy analysis.** *Pakistan Journal of Psychology*, 1974(Dec), Vol 7(3-4), 7-19.—A correlational analysis in nonexperimental situations can be further treated to reveal causality inferences. To illustrate the working of causality models, a sociological study of 5 variables was selected. Given an intercorrelational matrix of the variables, 4 possible theoretical models were assumed. For 1 possibility, it was assumed that 2 variables causally influenced the other 3, and consequently 3 possible predictive equations were derived. If the predicted values from the 3 sets of equations were found to provide a poor fit with the actual values, the next possibility was to be tried. Out of the 4, the 1 assumption concerning the causal roles of the particular variables which would give rise to the best fit was to be adopted as the final explanation.—*M. Akhtar*.

79. le Bras, H. (Ecole Polytechnique, Paris, France) **[Twenty multivariate analyses of a known structure.]** (Fren) *Mathématiques et Sciences Humaines*, 1974, No 47, 37-55.—In order to evaluate the empirical utility of correlational multivariate analysis, a data matrix derived from a simulated experiment of tumor growth (a spatial structure) was subjected to 20 different methods of analysis. It was demonstrated that each method highlighted some peculiar aspect of the structure, but none was useful in determining the original structure from data alone. It is concluded that multivariate analysis cannot generate information beyond a priori knowledge of structural relationships but rather contribute to its confusion.—*M. G. Strobel*.

81. Nishisato, Shizuhiko & Yamauchi, Hirotugu. **Principal components of deviation scores and standardized scores.** *Japanese Psychological Research*, 1974(Dec), Vol 16(4), 162-170.—Compared principal components of the variance-covariance matrix V and those of the corresponding correlation matrix R , and identified 2 contributors to the discrepancies between the 2 sets of principal components: the dispersion of the variances of the variables $\sigma(v)$ and the dispersion of the differences of the corresponding eigenvalues of V and R , $\sigma(\lambda - \lambda^*)$. Although both contributed independently to the discrepancies, the effect of $\sigma(v)$ overrode that of $\sigma(\lambda - \lambda^*)$. The similarity of eigenvalues did not necessarily mean the similarity of the corresponding components, or vice

versa. Instead, it is suggested that if the variances were homogeneous, the components of V and R tended to be very similar, even though the eigenvalues may have been vastly different. It is suggested that V be used if reasonable units of measurement are known and that R be used otherwise. In the latter case, the 1st principal component of R is seen as more informative than that of V .—*Journal abstract*.

82. Rim, Eui-Do. (U Illinois, Urbana-Champaign) **A stepwise canonical approach to the selection of "kernel" variables from two sets of variables.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 623.

83. Rouanet, H. & Lépine, D. **[The conflict between robustness and power of a test for differences between independent means.]** (Fren) *Mathématiques et Sciences Humaines*, 1974, No 47, 61-71.—Examines the various problems arising from sample size, heterogeneity of variance, and unequal sample populations. The following recommendations are made: (a) In case of heterogeneity of variance, the sample size can be equalized to render the choice of the test less critical. (b) For large samples, nonparametric tests are preferable because they are simpler and the loss of power disappears. (c) For small samples with homogeneous variances, parametric tests are more powerful. (d) For small samples with heterogeneous variances, nonparametric tests are robust.—*M. G. Strobel*.

84. Takane, Yoshio & Cramer, Elliot M. (U North Carolina) **Regions of significance in multiple regression analysis.** *Multivariate Behavioral Research*, 1975(Jul), Vol 10(3), 373-383.—There has been frequent confusion about the meaning of the various possible tests of significance in multiple regression, and this has led to discussions of "apparent contradictions" in regression. The present paper considers the case of 2 predictor variables, and figures are obtained which show the regions of significance of joint regression coefficients, regression coefficients considered separately, and the multiple correlation. The intersection of these regions of significance and nonsignificance illustrates how the various "apparent contradictions" and anomalies may occur.—*Journal abstract*.

85. Testerman, Roy L. (Medtronic, Minneapolis, MN) **Threshold determination by titration: A Markoff chain model.** *IEEE Transactions on Bio-Medical Engineering*, 1975(Jan), Vol 22(1), 53-57.—Threshold is often defined as that stimulus intensity which is correctly detected 50% of the time. A titration procedure increases the stimulus intensity by a fixed increment if the S fails to detect the stimulus, and decreases the stimulus if it is detected. The mean stimulus intensity thus obtained is an estimate of threshold. The Markoff chain model developed here allows the mean and variance of the mean to be calculated for any specified stimulus values, number of trials, and distribution of the underlying variate. Examples illustrate the effects of changing the experimental parameters and the underlying distribution. The titration mean was fairly insensitive to these changes.—*Journal abstract*.

EXPERIMENTAL PSYCHOLOGY (HUMAN)

86. **Brebner, John & Tiivas, Kustas.** (U Adelaide, Australia) **Choice RT with signals of unequal intensity.** *Australian Journal of Psychology*, 1975(Apr), Vol 27(1), 47-50.—This experiment with 12 undergraduates tested, and its findings supported, the hypothesis that in a 3-choice visual task condition in which 1 signal is brighter than the other 2, RT to all 3 signals will be significantly longer than the corresponding RTs obtained in a separate condition where all 3 signals are of equal brightness. The general nature of this effect, it is argued, implies that a unitary decision process which was affected by stimulus intensity, was applied to all stimuli, rather than each stimulus being dealt with independently of the others in that condition. The possible relevance of this method for the study of changes in information processing which occur with practice is noted.—*Journal abstract*.

88. **Reading, A. E. & Hemsley, D. R.** (King's Coll Hosp, London, England) **Categorizing and choice reaction time performance.** *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 129-130.—The visual search time for the presence of both of 2 physical stimuli was measured under 2 conditions: (a) conceptual identity, the targets being upper and lower case forms of the same letter (C.I); and (b) upper and lower case forms of different letters (D). It was hypothesized that C.I would facilitate the simultaneous analysis of the features of 2 letters in a visual display. Each of 8 male undergraduates searched for the 2 classes of stimuli on alternate days. Responses in the C.I condition were found to be significantly faster than in the D condition. Reaction time was shorter for an affirmative than for a negative response, but there was no interaction between conditions and affirmative or negative responses. Results are considered in relation to the concept of categorizing.—*Journal abstract*.

89. **Rice, Thomas R.** (Stanford U) **The economics of decision making.** Stanford, CA: Leland Stanford Junior U, RR No EES-DA-74-2, 1974. 18 p. Demonstrates that, for a class of decision problems, arbitrary parameterization is not necessary, and mathematically addresses the class of decision problems where the value function is approximately quadratic in both decision and state variables. Special cases are examined, and data required to operationalize the theorem are discussed.

90. **Rice, Thomas R.** (Stanford U) **The economics of decision making.** Stanford, CA: Leland Stanford Junior U, RR No EES-DA-74-1, 1974. 121 p. Mathematically creates a paradigm to evaluate the economic value of analysis; applies it to the Entrepreneur's Problem, budget constraint designs, and discrete decisions; presents flow charts for the design of a practical decision analysis; and makes suggestions for future research.

Perception & Motor Processes

91. **Berla', Edward P. & Murr, Marvin J.** (American Printing House for the Blind, Louisville, KY) **Psycho-**

physical functions for active tactual discrimination of line width by blind children. *Perception & Psychophysics*, 1975(Jun), Vol 17(6), 607-612.—Conducted 2 psychophysical experiments using the method of constant stimuli. In Exp I 93 blind 4th-12th graders (10-20 yrs old) made single judgments over each of 5 standards between 0.04 and 0.12 in. In Exp II, 6 2nd-12th graders (9-18 yrs old) were tested repeatedly over 7 standards between 0.04 and 0.50 in. Over the range of standards common to both experiments, the Weber fractions decreased as the width of the standard increased. For 2 larger standards (0.25 and 0.50 in.), the Weber fractions approached asymptote and then increased respectively suggesting a -shaped function. No differences in accuracy of discrimination were found between males vs females, age groupings, or grade groupings.—*Journal abstract*.

93. **Craske, Brian & Crawshaw, Martin.** (U Southampton, England) **Oculomotor adaptation to prisms is not simply a muscle potentiation effect.** *Perception & Psychophysics*, 1975(Aug), Vol 18(2), 105-106.—Conducted an experiment in which 10 right-handed Ss pointed to a visual target before and after exposure to prisms. The exposure condition required the S to look at his feet through leftward deviating prisms while holding his eyes to the right. Aftereffects on pointing were significantly to the right. This result is opposite to that predicted by the muscle potentiation hypothesis put forward by S. M. Ebenholtz and D. M. Wolfson (1975), but consistent with recalibration of the visual direction system caused by spatial discordance.—*Journal abstract*.

94. **Cross, David V. & Rotkin, Laurence.** (State U New York, Stony Brook) **The relation between size and apparent heaviness.** *Perception & Psychophysics*, 1975(Aug), Vol 18(2), 79-87.—Derived a formula for the size-weight illusion from J. C. Stevens and L. L. Rubin's (see PA, Vol 45:5318) finding that heaviness functions form a family of power functions that converge at a common point in the vicinity of the heaviest weight that can be lifted. Magnitude estimations of the apparent heaviness of 42 plastic cylinders varying in size and weight were obtained from 20 university students, who were allowed to use both hands to lift the weights. It was predicted that this would increase the maximum weight that could be lifted, which would, in turn, enhance the magnitude of the illusion (the dependence of heaviness on size). Results support this and other predictions of the model concerning the dependence of the illusion on weight as well as volume. (28 ref)—*Journal abstract*.

95. **Dawson, William E. & Mirando, Michael A.** (U Notre Dame) **Sensory-modality opinion scales for individual subjects.** *Perception & Psychophysics*, 1975(Jun), Vol 17(6), 596-600.—In 2 sessions each, 16 male undergraduates were asked to match apparent handgrip force and apparent duration in a counterbalanced order to the pronounceability of 12 trigrams in order to assess sensory modality opinion scales for individuals. Scales for individuals, like those for group data, were consistent across tasks and showed reliability across sessions. Ss displayed strong agreement on the

relative pronounceabilities of the trigrams according to Kendall's test for concordance. A significant intersession correlation for Ss' multimodality exponents indicated reliable differences in these exponents among individuals. Comparisons with psychophysical scales are made and discussed. (17 ref)—*Journal abstract*.

97. Gopher, Daniel; Williges, Beverly H.; Williges, Robert C. & Damos, Diane L. **Varying the type and number of adaptive variables in continuous tracking.** *Journal of Motor Behavior*, 1975(Sep), Vol 7(3), 159-170. —To investigate the effectiveness of various types and numbers of adaptive variables, 48 university students performed a 2-dimensional pursuit tracking task for 5 3-min training sessions. 3 variables (frequency of the forcing function, ratio of acceleration to rate control, and control stick sensitivity) were either fixed or adaptive. A transfer and retention task in which the tracking situation changed periodically was used to evaluate the ability of Ss to adjust to change. The highest rate of adaptation in frequency occurred when frequency was the only adaptive variable. Rate of adaptation in acceleration was greater early in training when frequency also adapted. More adaptation occurred in gain when another variable also adapted. During transfer Ss trained adaptively generally showed more stable performance in the changing task situation. Results are discussed in terms of stimulus and response similarity, the optimum number of adaptive variables, and the appropriateness of a changing task to evaluate adaptive training.—*Journal abstract*.

98. Jamieson, Donald G. & Petrusic, William M. (Carleton U, Ottawa, Canada) **Pairing effects and time-order errors in duration discrimination.** *Perception & Psychophysics*, 1975(Aug), Vol 18(2), 107-113.—Examined the effects, measured in terms of reproductions, of pairing 4-sec-duration stimuli for 6 interstimulus intervals (ISIs) varying between 1 and 26 sec. Results obtained in 2 experiments with a total of 20 university students suggest that both members of a pair were affected by pairing, with the 1st-presented underestimated and the 2nd-presented overestimated relative to unpaired durations. As well, unpaired durations tended to underestimate the standard. Each of these effects decreased in magnitude as ISI (delay) was increased. These results correctly predict the negative time-order errors observed in the comparison of durations and are interpreted as suggesting a memory-perceptual phenomenon rather than a decision bias as a locus for the time-order errors observed in the duration comparison situation. (24 ref)—*Journal abstract*.

100. Mandell, Gary P. & Auerbach, Carl. (Yeshiva U) **Effect of conflict between the body parts on perceptual adaptation.** *Perception & Psychophysics*, 1975(Aug), Vol 18(2), 121-124.—40 right-handed graduate and under-

graduate students, in 2 groups, adapted to prismatic displacement. One group adapted to a body target condition, in which they pointed to an external visual target with their right index fingers. The other adapted to a body target condition, in which they pointed to their left index fingers with their right index fingers. The visual target group showed more adaptation of the right hand and less adaptation of the left hand than did the body target group. Results are consistent with an assimilation tendency within the proprioceptive modality, namely that body parts that are in contact tend to be perceived as occupying the same spatial position.—*Journal abstract*.

101. Meiselman, Herbert L. (US Army Natick Lab, Food Sciences Lab, MA) **Effect of response task on taste adaptation.** *Perception & Psychophysics*, 1975(Jun), Vol 17(6), 591-595.—2 experiments studied whether Ss reported complete adaptation of a taste sensation. 3 tasks were chosen based on their use in other laboratories: hand lowering to connote stimulus absence, magnitude estimation, and cross-adaptation of a brief stimulus following a prolonged stimulus. In Exp I 3 different groups of 9 US Army enlisted men received the 3 different tasks; in Exp II 20 lab technicians received all 3 tasks. In both experiments, Ss failed to demonstrate complete taste adaptation in at least 50% of adaptation trials. Response task did affect the likelihood of observing complete taste adaptation. (16 ref)—*Journal abstract*.

102. Newell, K. M. & Chew, R. A. **Visual feedback and positioning movements.** *Journal of Motor Behavior*, 1975(Sep), Vol 7(3), 153-158.—60 university students performed both the reproduction and learning of a linear positioning movement under 1 of 5 visual feedback conditions. Results from 2 experiments indicate that visual cues from the task display augmented information available from visual feedback of the movement per se. Extraneous cues from the task display have clearly confounded the manipulation of visual feedback in previous positioning studies. When these cues are eliminated, visual distance information seems more useful than visual location information.—*Journal abstract*.

104. Petit, Anne-Marie. (CNRS Lab de Psychologie Expérimentale, U Provence, Aix-en-Provence, France) **[Decision strategy and corresponding psychometric functions: The fixed criterion and symmetrical criterion models compared.]** (Fren) *Cahiers de Psychologie*, 1974, Vol 17(1), 25-45.—Proposes adaptations of the equinormal model of signal detection theory when applied in psychophysical experimentation. It is argued that the decisional aspect of the model must be specified in relation to the decision strategy imposed by the experimental procedure. When signals of differing intensity are presented in random order, a fixed criterion model, regardless of signal intensity, is suggested. The 2-alternative forced-choice situation characteristic of signal detection procedure permits presentation of several intensities of stimulation in random order and introduces

nonsignal presentations. The decisional aspect is represented by a criterion for both variable and symmetrical as implied by the optimal strategy when $B = 1$. The fixed- and symmetrical-criterion models are illustrated by means of a tactile experiment. (English summary)—*E. E. Brown*.

105. Roy, Eric A. & Diewert, Gordon L. (U Waterloo, Canada) **Encoding of kinesthetic extent information.** *Perception & Psychophysics*, 1975(Jun), Vol 17(6), 559-564.—Investigated the difference in codability of kinesthetic extent cues for E-determined vs S-determined standards. In 2 experiments with a total of 80 undergraduates, the task involved moving a slide along a linear track a distance of $\frac{1}{2}$ of the total distance of the track. This distance (the standard) was then reproduced. During the presentation of the standard, reaction time to an auditory probe was recorded. One group of Ss determined their own standard (active condition), while the other group moved the slide to a stop located at the standard distance (constrained condition). All Ss were told that the standard was $\frac{1}{2}$ of the total distance. A more active encoding process was hypothesized to occur in the active condition which would be reflected in increased reaction time to the probe. Results do not support the attention hypothesis, in that probe reaction times were not significantly different for the 2 groups. Rather, the data suggest that the important variable in determining the codability of extent cues was the availability of a strategy and not whether the E or the S determined the standard.—*Journal abstract*.

106. Shigehisa, Tsuyoshi. (NASA Langley Research Ctr, Acoustics & Noise Reduction Div, Hampton, VA) **Effect of auditory stimulation on visual tracking as functions of stimulus intensity, task complexity and personality.** *Japanese Psychological Research*, 1974(Dec), Vol 16(4), 186-196.—Conducted a study with 15 students to test the hypothesis that visual dominance over auditory stimulation becomes less pronounced in introverted Ss when the task is simple, since the effect of heteromodal stimulus is expected to be greater when the task is simple or the S is introverted. Ss were administered a Japanese version of the Eysenck Personality Inventory; ophthalmographic determination was made under 5 tone intensities. Analysis of variance showed that effects of personality and intensity were independent in visual tracking (not sensitivity), suggesting a difference between peripheral and central phenomena. Simple fixation deteriorated under each intensity in introverts but improved in extraverts. In ambiverts, it improved under medium intensity only. Complex tracking improved under most intensities in introverts only. Introverts' fixation was inferior to ambiverts and extraverts at all intensities while their complex tracking was superior to extraverts. Significant correlations indicated that the more extraverted the S, the greater the improvement in simple fixation, and the more introverted the S, the greater the improvement in complex tracking. (27 ref)—*Journal abstract*.

107. Telage, Kal M. & Fucci, Donald J. (Ithaca Coll, School of Allied Health) **The effects of linear and logarithmic data transformations upon observed patterns of lingual vibrotactile sensitivity.** *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 210-212.—Ob-

tained vibrotactile thresholds from the anterior midline surface of the tongue on 3 groups ($N = 150$) of normal-speaking 18-36 yr olds. A different frequency condition was employed for each of the groups tested. Threshold values were initially recorded in millivolts and subsequently converted to microns of displacement and decibels. Data comparisons show a differential response to frequency for both kinds of transformations. This finding is discussed in terms of its implications concerning the nature and type of mechanoreceptors present in the cutaneous surface tissue of the tongue. Suggestions for further research in this area are made.—*Journal abstract*.

108. Verrillo, Ronald T. & Capraro, Anthony J. (Syracuse U, Inst for Sensory Research) **Effect of extrinsic noise on vibrotactile information processing channels.** *Perception & Psychophysics*, 1975(Aug), Vol 18(2), 88-94.—Cutaneous receptors sensitive to high-frequency vibration produce spatial summation at threshold levels of stimulation, whereas the response of the receptor population sensitive to low frequencies appears to be independent of contactor size at threshold. Reports have been made of a phenomenon in which the presumably nonsumming population of mechanoreceptors produce spatial summation at suprathreshold levels. A possible explanation concerns the relative signal-to-noise ratios of cutaneous mechanoreceptor systems. In the present experiment with 3 highly trained Ss, it was shown that, by selectively masking the systems with narrow-band and wide-band noise, any combination of signal frequency, masking noise, and contactor size that predominantly activated either system resulted in a linear effect of the masker on the threshold of the signal. Combinations of the experimental variables that activated both receptor systems simultaneously, reduced the effect of the masking by one-half. This is interpreted as evidence of an interactive process between receptor systems within the CNS. The effects of signal-to-noise ratio and intrasensory interactions are discussed. (15 ref)—*Journal abstract*.

109. Verrillo, Ronald T. & Gescheider, George A. (Syracuse U, Inst for Sensory Research) **Enhancement and summation in the perception of two successive vibrotactile stimuli.** *Perception & Psychophysics*, 1975(Aug), Vol 18(2), 128-136.—Conducted a series of experiments, with 5 or 6 well trained Ss in each, in which enhancement and summation were found to be fundamentally different perceptual processes affecting the sensation magnitude of 2 successive vibrotactile stimuli. Enhancement, defined operationally as an increment in the subjective magnitude of 1 stimulus due to the presentation of a prior stimulus, and summation, defined as an increment in overall subjective magnitude of the 2 stimuli, were measured for sinusoidal vibration of the thenar eminence of the hand. The effect of summation was maximum when the 2 stimuli greatly differed in frequency, whereas maximum enhancement effects were found when both stimuli were close in frequency. The summation effect showed little decay as the interstimulus interval was increased to as much as 500 msec, whereas enhancement effects decayed to zero at approximately 500 msec. Results are similar to those obtained in comparable studies of audition and support the hypothe-

sis that there are at least 2 distinct information-processing channels for the perception of cutaneous vibration. (22 ref)—*Journal abstract*.

110. Vișan-Mitea, Olimpia. (Academiei de Științe Sociale și Politice, Inst de psihologie, Bucharest, Romania) [Visual perception of oral language depending on the context.] (Romn) *Revista de Psihologie*, 1973, Vol 19(1), 69-81.—Studied the influence of linguistic microcontext on the perception of monosyllabic Romanian words, based on the visual cues of phonic mimicry. 16 Romanian-speaking high school students 20-25 yrs old, with normal psychosensorial capacities and without any special training in labial perception, were the Ss. The stimuli were 340 separate words and 60 sentences (each composed of 3 of the separate words arranged in a controlled order), film recorded with pronunciation and without (soundless). Perception of separate words was compared with perception of words embedded in sentences. The differences were nonsignificant. It is concluded that in general the microcontext has no facilitative influence on the visual perception of words, but that there is a complex influence of linguistic microcontext depending on individuals, on context position, and on the morpho-syntactic value of words. (French summary) (40 ref)—*C. Făcăoaru*.

111. Walker, James T. (U Missouri, St Louis) **Visual texture as a factor in the apparent velocity of objective motion and motion aftereffects.** *Perception & Psychophysics*, 1975(Aug), Vol 18(2), 175-180.—Conducted 2 experiments with a total of 24 undergraduates in which the apparent velocity of an objectively rotating visually textured disk was an increasing monotonic function of the coarseness (size) of visual texture. The apparent velocity of a negative motion aftereffect increased with coarseness of moving induction texture but decreased with coarseness of stationary test texture, and there was an interaction between induction and test textures. An explanation of these effects is based principally on the assumption of greater lateral inhibition between neighboring elements in finer textures. (17 ref)—*Journal abstract*.

112. Woodruff, Burrton; Jennings, Dennis L. & Rico, Nicholas L. (Butler U) **Time error in lifted weights as affected by presentation order and judgment mode.** *Perception & Psychophysics*, 1975(Aug), Vol 18(2), 98-104.—In the method of constant stimulus differences, results obtained under 2 presentation orders (standard first and standard second) are commonly combined to eliminate time error. The present study shows that this technique is not adequate for controlling time error, as the presentation orders have differential effects on points of subjective equality (PSE). Using a 2-handed technique, 96 right-handed undergraduates judged lifted weights on the comparative rating scale. Ss lifted the standard before, with, or after the variable stimulus. They also either judged the standard in terms of the variable or the variable in terms of the standard (mode of judgment). Judgment mode, a previously uninvestigated confounding variable of presentation order, was not an important factor in influencing the value of the PSE.—*Journal abstract*.

Visual Perception

113. Appelle, Stuart. (State University Coll New York, Brockport) **Luminance thresholds for circular and bar-shape stimuli.** *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 175-176.—Studies involving the contribution of stimulus form to the detection threshold for light are equivocal, but theoretical considerations suggest that circular stimuli should yield lower thresholds than bars. This hypothesis was tested by obtaining luminance thresholds for circular and bar-shaped targets presented from 5 to 60° into the periphery. Ss were 20 volunteers with normal uncorrected vision. Thresholds for circles were significantly lower than thresholds for bars. The difference ranged from about .4 log units at 5° to .2 log units at 60° eccentricity.—*Journal abstract*.

114. Bundesen, Claus & Larsen, Axel. (Copenhagen U, Denmark) **Visual transformation of size.** *Journal of Experimental Psychology: Human Perception & Performance*, 1975(Aug), Vol 104(1)(3), 214-220.—Conducted 3 experiments with a total of 13 20-50 yr old Ss (including the authors) with normal or corrected vision to investigate human visual identification of different-sized objects as identically shaped. Matching reaction times were measured for pairs of simultaneously presented random figures. Reaction time for correct reactions to test pairs of figures of the same shape and orientation consistently increased approximately linearly as a function of the linear size ratio of the figures. In Exp II, where this ratio was defined for control pairs as well as for test pairs, reaction time for correct reactions to control pairs showed a similar increase as a function of size ratio. Results suggest that the task was performed by a gradual process of mental size transformation of one of the members of each pair of figures to the format of the other one.—*Journal abstract*.

115. Compton, Allan & Bradshaw, John L. (Monash U, Clayton, Australia) **Differential hemispheric mediation of nonverbal visual stimuli.** *Journal of Experimental Psychology: Human Perception & Performance*, 1975(Aug), Vol 104(1)(3), 246-252.—Conducted 3 studies employing schematic faces of 3 features to explore the role of the left hemisphere as an analytic processor in difficult discriminations and the role of the right hemisphere in easy gestalt matches. 24 college students with normal or corrected vision were used in each experiment. In a discrimination task, the successively presented members of a stimulus pair differed in all 3 features. When both stimuli went to the same visual field there was a Visual Field \times Judgments interaction; judgments "same" were processed faster in the left visual field. When a test stimulus differing on all 3 features from a previously memorized target face was matched to the latter, both judgments "same" and "different" were made faster for stimuli in the left visual field. However, when the test stimulus and the memory items differed on only one feature the right field proved superior for both judgments "same" and "different."—*Journal abstract*.

116. Corballis, Michael C. & Roldan, Carlos E. (McGill U, Montreal, Canada) **Detection of symmetry as a function of angular orientation.** *Journal of Experimental Psychology: Human Perception & Performance*, 1975(Aug), Vol 104(1)(3), 221-230.—Conducted 3 experi-

ments with a total of 36 right-handed 18-25 yr olds with normal or corrected vision. Ss decided as quickly as possible whether dot patterns were or were not symmetrical about a line. Their decision times were shortest when the line was vertical and increased as the angle between the line and the vertical increased. This orientation function was essentially the same whether or not Ss knew in advance what the orientation of the line would be. When Ss tilted their heads, the function shifted in the direction of the head tilt, indicating that it was tied more closely to retinal than to gravitational coordinates. These data can be interpreted to mean that people mentally rotate patterns to a vertical orientation before judging their symmetry. This in turn suggests that the "template" for detecting symmetry may itself be embedded symmetrically in the brain. (21 ref)—*Journal abstract*.

117. Easton, Randolph D. & Shor, Ronald E. (Boston Coll) **Information processing analysis of the Chevreul pendulum illusion.** *Journal of Experimental Psychology: Human Perception & Performance*, 1975(Aug), Vol 104(1)(3), 231-236.—Conducted an information processing investigation with 15 undergraduates to quantify the M. E. Chevreul (1833, 1854) pendulum effect: the tendency of a small pendulum, when suspended from the hand and imaginatively concentrated on, to oscillate seemingly of its own accord. Using a time exposure photographic measurement technique, electronically automated visual and auditory imaginal prompts were presented to the S during imaginal processing tasks. Results show that the pendulum effect was enhanced when vision of actual pendulum oscillations was permitted and visual or auditory spatially oscillating stimuli were present. Visual spatial oscillating stimuli were superior to their auditory counterparts. Results are discussed in terms of ideomotor and visual capture interpretations of signal and imaginal processing. (23 ref)—*Journal abstract*.

118. Ellis, Stephen R. (Brown U) **Fragmentation of fixated line stimuli as a function of gravitational orientation.** *Perception & Psychophysics*, 1975(Jun), Vol 17(6), 601-606.—Studied the differential propensity of fixated line stimuli to fragment and disappear from view, as a function of the gravitational orientation of the stimuli. The propensity to fragment was measured in 14 paid undergraduates in terms of 3 intercorrelated dependent variables: the number of fragmentations per fixation period, the total duration of fragmentation per fixation period, and the latency to the 1st fragmentation. Unlike some anisotropic visual phenomena, which may reflect orientation-independent aspects of pattern perception, the observed anisotropy of propensity to fragment can be attributed overwhelmingly to the retinal orientation of the stimuli. Accordingly, this property of fragmentation need not be ascribed to higher order aspects of pattern perception. (43 ref)—*Journal abstract*.

119. Epstein, William. (U Wisconsin, Madison) **Recalibration by pairing: A process of perceptual learning.** *Perception*, 1975, Vol 4(1), 59-72.—When 2 cues which normally agree in determining perceived depth are experimentally paired so that they designate discrepant values for the depth dimension, an opportunity is created for the recalibration or reevaluation of the cues. Experiments which show recalibration of the

oculomotor cues and recalibration of binocular disparity as a result of pairing these cues with other discrepant cues are reviewed. The locus of change is related to the relative dominance of different cues, and the contribution of allocation of attention in determining dominance is discussed. Implications of recalibration by pairing for understanding ontogenetic development are considered. It is suggested that some cues may acquire their effectiveness as a consequence of pairing during development. (47 ref)—*Journal abstract*.

120. Girgus, Joan S.; Coren, Stanley; Durant, Mitchell & Porac, Clare. (City Coll, City U New York) **The assessment of components involved in illusion formation using a long-term decrement procedure.** *Perception & Psychophysics*, 1975(Aug), Vol 18(2), 144-148.—Available evidence seems to indicate that illusion decrement represents reorganization of cognitive components involved in visual-geometric illusions. 20 normally seeing adult observers viewed 1 of the 2 forms of the Mueller-Lyer illusion, containing differential opportunities for peripheral structural interactions, for a 10-min test session on each of 5 successive days. The magnitude of the distortion decreased to a different asymptotic level in each of the 2 configurations with the form, with more opportunity for structural interactions showing the higher asymptote. Thus, this asymptote probably represents the structural or physiological contribution to the illusory distortion. (39 ref)—*Journal abstract*.

121. Gogel, Walter C. & Newton, Robert E. (U California, Santa Barbara) **Depth adjacency and the rod-and-frame illusion.** *Perception & Psychophysics*, 1975(Aug), Vol 18(2), 163-171.—In Exp I the tactile adjustment of a comparison bar was used with 72 normally seeing undergraduates to measure the change in the rod-and-frame illusion as a function of the stereoscopic position of the rod relative to the frame. A vertical rod was presented at a near, a middle, or a far distance, with a single frame tilted counterclockwise at the near distance, a single frame tilted clockwise at the far distance, or 2 frames of opposite tilt presented simultaneously at the near and far distances. When only 1 frame was present, displacement of the rod in front of the far frame but not behind the near frame significantly reduced the illusion. When both frames were present, the illusion was determined mainly by the frame at the apparent distance of the rod. In Exp II with 36 Ss, the tactile method of measuring perceived tilt was validated for the range of perceived tilts encountered in Exp I. Results of Exp I are discussed in terms of the perceptual resolution of the conflict between relative and absolute cues of tilt. (19 ref)—*Journal abstract*.

122. Handel, Stephen. (U Tennessee, Knoxville) **Backward masking: The role of the target + mask composite.** *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 117-119.—In a backward masking reproduction task with 8 undergraduates with normal vision, the target was a 4-dot pattern placed in a 3 × 3 array, and the mask was a single dot placed in 1 of the 5 remaining empty cells of that array. The target plus mask composite is thereby a 5-dot pattern. Results demonstrate that redundant 4-dot patterns were easier to reproduce. Moreover, the redundancy of the composite affects accuracy. Reproduction was most accurate when

the redundancy of the target matched the redundancy of the composite. Thus, the structural characteristics of the whole determined the perception and realization of the subparts.—*Journal abstract.*

123. Hess, Eckhard H.; Beaver, Paul W. & Shroet, Patrick F. (U Chicago) Brightness contrast effects in a pupillometric experiment. *Perception & Performance*, 1975(Aug), Vol 10(2), 128-129. Pupilometric experiments which employ picture slides as stimuli have been criticized for their failure to control intrastimulus brightness variation. This factor has been suggested as the source of pupil size changes that are observed in response to picture slide stimuli, rather than the emotional response of the S. The present study required 32 university students to direct their gaze to areas of a slide that varied in brightness. On the basis of the obtained results, it is concluded that brightness contrast does not play a major role in the pupil's response to picture slide stimuli which have been properly prepared.—*Journal abstract.*

124. Kelso, J. A.; Cook, Elizabeth; Olson, Michael E. & Epstein, William. (U Wisconsin, Madison) Allocation of attention and the locus of adaptation to displaced vision. *Journal of Experimental Psychology: Human Perception & Performance*, 1975(Aug), Vol 104(1)(3), 237-245. Conducted 2 experiments with a total of 20 undergraduates and 30 right-handed paid volunteers. Experimental Ss were exposed to prism-induced visual displacement of a target whose location was correctly given by proprioceptive-kinesthetic information. Control Ss were exposed alternately to visual displacement or proprioceptive-kinesthetic location information. During the adaptation period, experimental Ss in the visual attention condition performed a localization task that directed them to attend selectively to the visual modality; experimental Ss in the proprioceptive attention condition attended selectively to the proprioceptive modality; control Ss performed the task on the basis of the available modality. Measures of adaptation and aftereffect were secured separately in each of the 2 modalities. These confirmed the predictions that the shifts in the experimental conditions would be confined to localization tests dependent on the unattended modality and that control Ss would not exhibit adaptation. It is proposed that allocation of attention determines situational dominance and that dominance determines the locus of adaptation. Findings are compared to those reported by L. K. Canon (see PA, Vol 44:9610) and are applied to a reassessment of the "visual capture" phenomenon. (18 ref)—*Journal abstract.*

125. Kennedy, John M. (U Toronto, Scarborough Coll, Canada) Depth at an edge, coplanarity, slant depth, change in direction and change in brightness in the production of subjective contours. *Giornale Italiano di Psicologia*, 1975(Apr), Vol 2(1), 107-123. Conducted an experiment with 14 undergraduates who were asked to respond to a series of questions, none of which mentioned depth at an overlapping edge, to determine whether the subjective contour could accompany perception of contiguous surfaces. Results show that in the formation of subjective contours it was not necessary to have step-like changes in depth, from one overlapping region to the background region. The contour could

be perceived as a contour in the background as well as in the foreground. The shape of subjective contours was influenced by the groupings of the real lines and contours of stimulus displays and could be sharp or diffuse, induced by line terminations, changes in direction, or gradual fading-out of lines. (Italian abstract)—*Journal summary.*

126. Lefton, Lester A. & Orr, Terry B. (U South Carolina) Metaccontrast can be obtained in the fovea: An examination of retinal location and target size. *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 169-172. Assessed metaccontrast as a function of target size, retinal location, and interstimulus interval, using 6 undergraduate Ss with normal or corrected vision. Supporting previous findings, there was no effect of retinal location in metaccontrast. Various target sizes produced similar results. Monotonic metaccontrast functions were obtained in all conditions. (16 ref)—*Journal abstract.*

127. Leibowitz, H. W. & Owens, D. A. (Pennsylvania State U) Anomalous myopias and the intermediate dark focus of accommodation. *Science*, 1975(Aug), Vol 189(4203), 646-648.—Conducted a series of experiments, utilizing the laser optometer, to investigate the relationship between the anomalous myopias and the focus assumed by the eye in the absence of light stimulation. The latter condition was achieved by measuring the accommodative response in total darkness. These measures are therefore referred to as the dark focus of accommodation. In tests with 124 college students, the dark focus of accommodation for an individual observer correlated highly with the magnitude of night, empty field, and instrument myopia. These anomalous myopias are interpreted as resulting from the passive return of accommodation to an individually determined intermediate dark focus when the stimulus for accommodation is degraded or absent, or when the need for accommodation is eliminated.—*Journal abstract.*

128. Morgan, Michael J. & Thompson, Peter. (U Cambridge, Psychological Lab, England) Apparent motion and the Pulfrich effect. *Perception*, 1975, Vol 4(1), 3-18.—The Pulfrich pendulum effect, obtained by viewing a moving object with a filter over 1 eye, was examined in 4 experiments with target stimuli in apparent, rather than continuous, motion. The authors and 2 naive Ss participated. The filter-induced depth effect persisted until a degree of intermittency in the presentations of the target was reached, and then it broke down. The degree of intermittency that could be tolerated before the depth effect broke down increased with the density of the filter. It appears that the shifted-pairing effect cannot account for the depth impression seen when the target intermittency was less than about 30 msec. Below this value of intermittency a filter could produce a depth effect even when the delay it introduced was small in comparison to the intermittency of the output. The depth effect seen with intermittencies less than 30 msec appeared to be of the same magnitude as that obtained with stimuli in continuous motion. It is concluded that a filter can cause 2 different kinds of depth shift with apparently moving stimuli. (16 ref)—*Journal abstract.*

129. Oyama, Tadasu. (Chiba U, Japan) **Determinants of the Zoellner illusion.** *Psychological Research*, 1975, Vol 37(3), 261-280.—Investigated effects of various stimulus variables on the Zoellner illusion. The illusion was greatest when both the stimulus figure and the comparison stimulus were oriented 45° to the vertical. It decreased as the gap between the oblique lines and the parallel lines increased, reaching zero at a gap of $24-48'$. It increased as the length of the oblique lines increased and reached an asymptote when the perpendicular distance from the end of the oblique lines to the parallel lines was about $45'$. It always varied systematically with the intersect angle, but the optimal angle varied by $15-30^\circ$ degrees according to the conditions of the gap and the length of oblique lines. Considerable illusions were obtained even when the stimulus figure was reduced to a single line intersected by oblique lines. Negative illusions were obtained with an intersect angle of 10° . Results support a view that the Zoellner illusion is caused by neural interactions among direction analyzers in the cortex.—*R. Gunter*.

130. Penner, M. J. (Hunter Coll, City U New York) **The perception of offset: A problem of decision criteria.** *Perception & Psychophysics*, 1975(Jun), Vol 17(6), 587-590.—C. E. Robinson (see PA, Vol 52:9062) presented a simple form of an hypothesis which assumes that the sensory response to a stimulus persists for a period of time exceeding its physical duration. He uses this hypothesis to predict R. Efron's (see PA, Vol 44:5913) results concerning the delayed perception of offset of brief stimuli. The present study proposes a natural extension of this hypothesis that assumes that each S adopts a "personal" criterion in order to judge offset. This model not only provides predictions consistent with Efron's data but can also predict data of quite dissimilar appearance, including the data of the present study derived from experiments with 5 Ss.—*Journal abstract*.

131. Pynte, Joël. (CNRS U Provence, Lab de Psychologie Expérimentale, Aix-en-Provence, France) **[The syllable as visual unit.]** (Fren) *Cahiers de Psychologie*, 1974, Vol 17(1), 47-53.—Examined the operation of syllabic units in a visual experiment, following the click system used in auditory experiments. A word was presented tachistoscopically, first as a whole and then at 80-sec intervals, with a dash superimposed at successive positions in the word. 32 Ss responded orally, 32 in writing. Errors preserving syllable integrity were more numerous than those that did not. Error differences by response modality were nonsignificant, but Ss giving written responses tended to displace the dash toward the right, suggesting that in written responses localization of the dash occurs during reproduction of the recognized word rather than at the moment of perception (English summary)—*E. E. Brown*.

132. Schiffman, Harvey R. & Thompson, Jack G. (Rutgers State U, New Brunswick) **The role of figure orientation and apparent depth in the perception of the horizontal-vertical illusion.** *Perception*, 1975, Vol 4(1), 79-83. Performed an experiment with 40 normal, seeing undergraduates which examined the role of figural orientation directly, and the role of an inappropriately invoked size-constancy mechanism indirectly, in the

actuation and magnitude of the horizontal-vertical illusion. When the vertical line of the stimulus figure was aligned above the horizontal line, the illusory effect was significant and positive; in contrast, when the vertical line was located below the horizontal line, the illusion was negative. Under the assumption that a vertical line can appear as a foreshortened line in depth, these findings support an explanation based on the operation of a misapplied size-constancy mechanism. (19 ref)—*Journal abstract*.

133. Trachtman, Joseph N. & Dippner, Robert F. (State U New York, Coll of Optometry, New York) **Psychophysical scaling of the prism diopter unit.** *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 140-142.—Investigated the relation between actual and perceived prism displacement for monocular and haploscopic conditions. 5 males in their mid-20s made estimates of the displacement of 10 prisms ranging in power from .76 to 21.03 prism diopters. The power exponent for both monocular and haploscopic conditions approximated unity. The demonstration that perceived prism displacement is a ratio scale will allow the treatment of tests of monocular and haploscopic prism displacement by parametric statistics.—*Journal abstract*.

134. Virsu, Veijo & Vuorinen, Risto. (U Helsinki, Psychological Lab, Finland) **Dark adaptation and short-wavelength backgrounds decrease perceived size.** *Perception*, 1975, Vol 4(1), 19-34.—Studied the effects of background luminance, contrast, and background wavelength on the perceived size of small line figures, using more than 40 Ss. Perceived size diminished at low levels of background luminance, and the effect disappeared at high levels of luminance. Perceived size of luminous circles increased as a logarithmic function of background luminance. Perceived size of small luminous circles also increased as a function of contrast at low values of contrast, but at very high values of contrast there was a decrease in perceived size. Control experiments led to the conclusion that dark adaptation was the primary source of the size effects. A shift from cone vision to rod vision contributed to the effects, for a stimulus looked smaller on a short- than on a long-wavelength background. The size effects can be predicted from the changes of receptive-field properties of single neurones under corresponding conditions of stimulation, if it is assumed that the perception of size is mediated by size-specific channels formed of single neurones. Stimulation that leads to an activation of small receptive fields appears to indicate to the brain the presence of small retinal images. (35 ref)—*Journal abstract*.

135. Wade, N. J. (U Dundee, Scotland) **Binocular rivalry between single lines viewed as real images and afterimages.** *Perception & Psychophysics*, 1975(Jun), Vol 17(6), 571-577.—Measured binocular rivalry alternations between single lines oriented at 0 and 90° or 0 and 45° viewed by 4 Ss. The experiment was designed to determine whether or not a vertical line predominates for longer than a nonvertical line and to compare the temporal characteristics of rivalry between real images and afterimages. There were no systematic differences in predominance durations under any of the rivalry pairings or viewing conditions. The dominance periods

of rivalry between afterimages were longer than those for real images. Frequency distributions of the dominance periods were all positively skewed, and the parameters of the fitted gamma distributions were similar in all cases. Tests of the sequential dependence of successive dominance periods indicated that they were independent for both real and afterimages. (16 ref)—*Journal abstract*.

136. Wade, Nicholas J. (U Dundee, Scotland) **Monocular and binocular rivalry between contours.** *Perception*, 1975, Vol 4(1), 85-95.—Investigated the temporal characteristics of rivalry between orthogonal gratings of the same or complementary colors. In 5 experiments with a total of 90 Ss, rivalry was measured in terms of the dominance of either grating or the visibility of composites comprised of parts of both gratings. The total duration for which either grating was dominant was significantly longer in binocular rivalry between gratings of complementary colors. A comparison of binocular and monocular rivalry indicated considerable phenomenal differences between them. Dominance in binocular rivalry corresponds to the visibility of 1 grating alone; this occurs rarely in monocular rivalry, which is characterized by fluctuations in the distinctiveness of the gratings. The changes in distinctiveness are influenced by color in a similar manner to that in binocular rivalry, and the frequencies of fluctuations are higher for gratings of complementary colors. (18 ref)—*Journal abstract*.

137. Wenderoth, Peter; O'Toole, Brian & Curthoys, Ian. (U Sydney, Australia) **The effect of inducing-line length on the magnitudes of the tilt illusion and aftereffect.** *Australian Journal of Psychology*, 1975(Apr), Vol 27(1), 1-7.—Conducted 5 experiments, using 25 undergraduates in each, to gather preliminary data on the magnitudes of the tilt illusion and aftereffect as a function of the relative lengths of single inducing and test lines. In general, results suggest that the illusion and aftereffect are smaller when the inducing line is shorter than the test line but not when the inducing line is longer than the test line. Hence, the 2 effects do not appear to be line-length specific. Although inducing line length seemed to affect the illusion and aftereffect to different extents, it is concluded that further evidence is required to substantiate this apparent difference.—*Journal abstract*.

138. Wist, Eugene R.; Diener, H. C.; Dichgans, J. & Brandt, Th. (Franklin & Marshall Coll, Whitely Psychology Lab) **Perceived distance and the perceived speed of self-motion: Linear vs. angular velocity?** *Perception & Psychophysics*, 1975(Jun), Vol 17(6), 549-554. In a series of experiments with 11 paid university students, it was found that, with the angular speed of a visual surround held constant, the perceived speed of rotary self-motion increased linearly with increasing perceived distance of this surround. This finding is in agreement with a motion constancy equation derived from a consideration of object-referred motion perception. Since information concerning distance is necessary for the perception of linear but not angular speed, this finding supports the conclusion that visually perceived rotary self-motion perception is dependent upon perceived linear surround motion at least in the horizontal plane. The visual motion constancy mechanism which

operates for object-referred motion can apparently not be switched off for the special case of self-motion perception. (18 ref)—*Journal abstract*.

Auditory & Speech Perception

139. Dockum, Gary D. & Robinson, Dale O. (Woodbury County Dept of Special Education, Pupil Services Ctr, Sioux City, IA) **Warble tone as an audiometric stimulus.** *Journal of Speech & Hearing Disorders*, 1975(Aug), Vol 40(3), 351-356.—Compared pure-tone and warble-tone thresholds for 198 normal-hearing college students at 6 frequencies at octave intervals from 250 through 8,000 Hz. Results show significant differences ($p < 0.01$) for the test frequencies 500, 2,000, 4,000, and 8,000 Hz. Although significant differences were found at 4 of the 6 test frequencies, mean differences were quite small, the largest being 2.3 db at 8,000 Hz. This finding supports the notion that the audiologist may use warble tone with stimulus parameters up to and including frequency deviations of $\pm 5\%$ with modulation rates of 5/sec to measure thresholds, which are directly comparable to pure-tone thresholds for patients with normal hearing and those with relatively flat hearing loss.—*Journal abstract*.

140. Fastl, H. (Technischen U, Inst für Elektroakustik, Munich, W Germany) **Pulsation patterns of sinusoids vs. critical band noise.** *Perception & Psychophysics*, 1975(Aug), Vol 18(2), 95-97.—Employed 8 normally hearing observers to compare pulsation patterns of both sinusoidal and critical band maskers at masking frequencies of 400 Hz and 1, 2, and 4 kHz. At the slope towards low frequencies, the pulsation pattern of a sinusoid was up to 30 db lower than the pattern of a critical band noise; at the upper slope, only small differences (4 db) were noticed. Variations in the temporal configuration of the stimulus yielded a great variety of pulsation patterns for the same masker. Therefore, the interpretation of pulsation patterns as a quantitative measure of the ear's frequency selectivity is still obscure. On the other hand, a comparison of pulsation patterns of different maskers, measured with the same stimulus paradigm, seems to be useful.—*Journal abstract*.

141. Gelfand, Stanley A. (City U New York) **The effect of reverberation time on the speech discrimination performance of hearing impaired individuals under monaural and binaural amplification.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1396-1397.

142. John, I. D. (U Adelaide, Australia) **A common mechanism mediating the time-order error and the cross-over effect in comparative judgments of loudness.** *Australian Journal of Psychology*, 1975(Apr), Vol 27(1), 51-60.—Notes that analysis of data from comparative judgments of loudness suggests that the time-order error and the cross-over effect are both reflections of the operation of a common judgment process. This process is tentatively identified as the making of an implicit verbal response which serves to recode the information in the stimuli. Results of 3 experiments on comparative judgment of loudness, using a total of 89 undergraduates, are described which are consistent with this suggestion. (24 ref)—*Journal abstract*.

143. Kornburger, Roy A. & Elfner, Lloyd F. (Florida State U) **The role of pitch sensation in the monaural localization of white noise.** *Journal of Auditory Research*, 1972(Oct), Vol 12(4), 325-330.—Explored the extent to which monaural sound localization is affected by the spectral content and the duration of sounds. 18 normal-hearing young adults, rendered functionally monaural, made right-left (R-L) judgments with sound sources $\pm 45^\circ$ from midline. Noise bursts (3 msec rise-fall times) of 0.01, 0.1, or 1-sec duration were presented singly for judgment. Bandwidths were 2-2.5, 2-3.15, or 2-4 kc/sec. L-R signals were always equated for loudness. Additional spectral information in the wider bands led to better performance; a general deterioration with the shorter bursts allowed the conclusion that Ss judged R-L on the basis of pitch cues which are known to be reduced at the shorter durations used here.—*Journal summary.*

144. Loeb, Michel & Holding, Dennis H. (U Louisville) **Delayed interference in pitch judgments.** *Journal of Auditory Research*, 1972(Oct), Vol 12(4), 336-339.—Examined the temporal relations controlling backward masking of pure tones. 16 adults judged whether 2 tones, always 4 sec apart, were the same or different. All tones were at 80 db SPL. The standard tone was 1,000 Hz; the variable tone was either 1,000, 1,006, 1,012, or 1,025 Hz. The order of presentation of the 2 stimulus tones was balanced across Ss. The masker (2,193 Hz) followed either the 1st tone (interposed masking) or the 2nd tone (postcomparison masking) by delay intervals of 40, 100, 250 msec. Extent of masking was inversely proportional to both frequency difference and delay interval. Masking was greatest when the variable tone preceded the masker, regardless of whether the variable tone was the 1st or 2nd tone. It is concluded that Ss used the variable tone as the basis for absolute judgments of pitch (i.e., the standard tone appeared to be almost superfluous).

145. Morais, José & Bertelson, Paul. (U libre, Brussels, Belgium) **Spatial position versus ear of entry as determinant of the auditory laterality effects: A stereophonic test.** *Journal of Experimental Psychology: Human Perception & Performance*, 1975(Aug), Vol 10(4)(3), 253-262. Conducted 5 experiments concerned with discriminating between ear of entry and apparent spatial position as possible determinants of lateral asymmetries in the recall of simultaneous speech messages. A total of 88 15-31 yr old right-handed students who had no hearing defects served as Ss. Apparent localization to the left or right of the median plane was created either through a time difference (7 msec), through intensity differences between presentations of the same verbal message at the 2 ears, or through dichotic presentations. Right side advantage was observed with the 3 types of presentation (Exps I, II, and III). The finding of right side advantage with stereophony based on a time difference only, in the absence of intensity difference, cannot be accounted for in terms of an ear advantage and shows that apparent spatial separation of the sources can by itself produce a laterality effect. Differences in the degree of lateral asymmetry between the various conditions were also observed. Findings of Exps IV and V suggest that these differences are better explained in terms of different

impressions of localization of the sound sources than in terms of relative intensity at the "privileged" ear. (16 ref)—*Journal abstract.*

146. Penner, M. J. (Hunter Coll, City U New York) **Persistence and integration: Two consequences of a sliding integrator.** *Perception & Psychophysics*, 1975(Aug), Vol 18(2), 114-120.—Investigated the detection by 3 Ss (including the author) of a silent interval, or gap, placed in the temporal center of a gated noise burst. The gated noise masker ranged from 2 to 400 msec in duration. For long noises, the duration, Δ of the just-detectable gap remained fixed at about 2.8 msec. Progressively shortening the duration of the noise did not affect Δ until the duration was approximately 20 msec; thereafter, decreasing the noise duration improved detectability of the gap. In Exp II, continuous noise filled the temporal gap, although the decibel difference between the noise in the gap and the noise surrounding the gap was always at least 5 db. The level of noise filling the gap did not greatly affect Δ . Exp III was similar to Exp I, except that the signal was a click rather than a gap. Results for both gaps and clicks are fitted by a model assuming a sliding integrator.—*Journal abstract.*

147. Radocy, Rudolf E. (U Kansas) **A naive minority of one and deliberate majority mismatches of tonal stimuli.** *Journal of Research in Music Education*, 1975(Sum), Vol 23(2), 120-133.—Investigated individual conformity to deliberately erroneous majority judgments of pitch and loudness. 136 university music students, randomly assigned to experimental or control groups, evaluated 18 pitch or loudness items by publicly indicating, after hearing responses of 4 confederates, which of 3 tones matched a standard. Results include a .30 overall conformity rate in the experimental group for pitch and a .49 rate for loudness. Comparisons between groups and intrapersonal comparisons generally were highly significant. It is concluded that music students may defy their sensory inputs and yield to erroneous peer judgments. Results partially confirm other studies suggesting greater conformity with more ambiguous stimuli.—*Journal abstract.*

148. Reed, Charlotte. (U Pittsburgh, Medical School) **Reaction time for a same-different discrimination of vowel-consonant syllables.** *Perception & Psychophysics*, 1975(Aug), Vol 18(2), 65-70.—Measured reaction times (RTs) in 4 normally hearing young adults for decisions in a same-different discrimination of successive vowel-consonant nonsense syllables. Averaged data showed that "same" RTs were faster than "different" RTs and that the "different" RT decreased as the number of features by which a pair contrasted increased. For individual phonemic comparisons, 2 of the dependent variables, $P(S/d)$, or probability of responding "same" to a different trial and the mean correct "different" RT, were related in that the RT increased as $P(S/d)$ increased. The size of the difference between "same" and "different" RTs for a given phonemic contrast was directly related to $P(S/d)$. The difficulty of a comparison as described by $P(S/d)$ and by the difference between correct "same" and "different" RTs, was explained through a markedness classification of phonemes. (24 ref)—*Journal abstract.*

149. Sanderson, Arthur C. (Carnegie-Mellon U) **Discrimination of neural coding parameters in the auditory system.** *IEEE Transactions on Systems, Man, & Cybernetics*, 1975(Sep), Vol 5(5), 533-542.—Examines the discriminability of small changes in amplitude and frequency of a pure tone auditory stimulus in terms of statistical estimators of neural coding parameters. The neural spike train encoding process is described in terms of a multimodal histogram of interspike intervals in which both stimulus amplitude and stimulus frequency can be encoded in the same spike train. Performance of the neural coding parameters is evaluated using the Cramér-Rao bound as a measure of discriminability of statistical estimators. The dependence of the Weber fraction for stimulus frequency and stimulus amplitude is derived as a function of frequency, amplitude, and observation interval. Results are compared to results of psychophysical experiments. It is concluded that while statistical estimates based on 1 primary auditory nerve fiber would be insufficient to account for psychophysical performance, estimates based on 10-12 fibers sampled in parallel would be sufficient. 150. Shaw, D. J. (U Kent, Darwin Coll, Canterbury, England) **A phonological interpretation of two acoustic confusion matrices.** *Perception & Psychophysics*, 1975(Jun), Vol 17(6), 537-542.—Uses multidimensional scaling and principal component analysis methods to examine 2 acoustic (open vs closed vowels, vowel + consonant vs consonant + vowel, and fortis vs lenis consonants) can be identified with phonological phenomena which could have contributed to the confusions.—*Journal abstract.*

Cognitive Processes

151. Anderson, Norman H. (U California, Ctr for Human Information Processing, San Diego) **Equity judgments as information integration.** *Center for Human Information Processing Technical Report*, 1974(Dec), No 47, 1-28.—Tested 3 algebraic models derived from equity theory in a 3-part experiment in which 24 undergraduates judged fair pay for 2 persons, A and B. In Part 1 Ss were told how well A and B had performed and how much A had paid; they judged how much B should be paid. Theoretically, these judgments should follow a 3-factor multiplying model. Qualitatively, the data fit this model fairly well, but there were substantial quantitative deviations. In Part 2 Ss were told how well A and B had performed; they divided a fixed sum between A and B. Theoretically, these judgments should follow a ratio model, and the data fit this model reasonably well. In Part 3 Ss were told how well B had performed and how hard he had tried, with A being average in both respects. The model for these judgments is also a ratio model, but it requires a preliminary integration of the 2 cues about B's input. The data failed to follow the input-summation ratio model; instead they appeared to follow a simpler adding model. The contrast between the results of Parts 2 and 3 raises doubt about the hypothesis of input summation that has been used in equity theory. (17 ref)—*Journal abstract.*

152. Baron, Jonathan. (U Pennsylvania) **Effect of inconsistent distinctiveness of artificial semantic features on retrieval speed.** *Journal of Psycholinguistic Research*, 1975(Oct), Vol 4(4), 319-330.—A purported

universal of language is the generalization of distinctive features, for example, in phonology and semantics, within a language or an individual. This could be due to a tendency either to use or to ignore a feature depending on whether or not it has previously been distinctive. Results of 3 experiments show that this mechanism operates in retrieval of well-learned artificial concept names. Several simple models of performance cannot account for this effect. The apparent inefficiency of possible mechanisms which could account for this result suggests that it may reflect a special predisposition.—*Journal abstract.*

153. Brushlinskii, A. V. (USSR Academy of Sciences, Inst of Psychology, Moscow) **[Mathematization of the psychology of thinking: Basic problems and perspectives.]** (Russ) *Voprosy Psikhologii*, 1975(Jan-Feb), No 1, 3-11.—Compares the basic principles of the psychology of thinking and of set theory. Sets, being collections of clearly distinct and separate elements, possess the property of disjunctiveness, which is not inherent in thinking as a process, since in such a process all the stages and components continuously pass into each other on the basis of genetic (i.e., nondisjunctive) relationships. It is suggested that for this reason a psychology of thinking based on considerations from set theory is not possible. The possibility of using some form of non-disjunctive mathematics is noted. (English summary) (21 ref)—*L. Zusne.*

154. Cartwright, Rosalind D. et al. (U Chicago) **Effects of REM time on what is recalled.** *Psychophysiology*, 1975(Sep), Vol 12(5), 561-568.—To test the effects of REM sleep on the amount and kind of material recalled after a 7-hr interval, 5 groups of 10 undergraduates each were tested for immediate and delayed recall of 70 adjectives before and after varying amounts of REM time. There were no significant between-group differences in total amount of delayed recall, but there were differences in the number of new words retrieved. Following a REM-present condition Ss recalled more new words than following a REM-absent condition. The properties associated with words recalled later differed following different conditions. The new words available to recall only after REM absent sleep were self-affirming items. Those which became available following REM present sleep were items of personal discomfort. The nature of the intervening psychophysiological states appeared to affect the kind of material recalled. (37 ref)—*Journal abstract.*

155. Cartwright, Rosalind D. et al. (U Chicago) **Effects of REM time on what is recalled.** *Psychophysiology*, 1975(Sep), Vol 12(5), 561-568.—To test the effects of REM sleep on the amount and kind of material recalled after a 7-hr interval, 5 groups of 10 undergraduates each were tested for immediate and delayed recall of 70 adjectives before and after varying amounts of REM time. There were no significant between-group differences in total amount of delayed recall, but there were differences in the number of new words retrieved. Following a REM-present condition Ss recalled more new words than following a REM-absent condition. The properties associated with words recalled later differed following different conditions. The new words available to recall only after REM absent sleep were self-affirming

items. Those which became available following REM present sleep were items of personal discomfort. The nature of the intervening psychophysiological states appeared to affect the kind of material recalled. (37 ref) —*Journal abstract.*

156. D'Arcais, Giovanni B. (U Leiden, Psychological Inst, Netherlands) **Semantic and perceptual factors in the processing of comparative sentences.** *Giornale Italiano de Psicologia*, 1974(Dec), Vol 1(3), 267-303. —Discusses results of 5 experiments on comparative sentences of inequality with a total of 154 Ss (mostly university students). In a series of sentence-picture verification situations, it was shown that comparative sentences constructed with unmarked adjectives were consistently easier to process than the corresponding marked sentences constructed with marked adjectives. This effect was clear even when experimental manipulation of the perceptual context of the pictures against which the sentences were verified should facilitate picture encoding in the marked dimension, and could be neutralized through cuing of the marked dimension prior to presentation of the picture. Results suggest that in a task of verifying comparative sentences against pictures representing a relation between 2 objects, the pictures are normally encoded in the unmarked dimension. (Italian summary) (21 ref) —*Journal abstract.*

157. Estes, W. K. (Rockefeller U, New York, NY) **The locus of inferential and perceptual processes in letter identification.** *Journal of Experimental Psychology: General*, 1975(Jun), Vol 104(2), 122-145. —Conducted 2 experiments with a total of 56 Ss which attempted to clarify the nature and temporal course of the processes responsible for the often reported superior identifiability of letters presented in a word context over letters embedded in nonwords or presented alone. Exp I confirmed and extended results of other studies concerning the effects of word or nonword context under a forced-choice detection procedure. Additional findings in Exp II suggest that the inferior performance on single letters is almost entirely attributable to a greater incidence of omission errors; however, the difference between words and nonwords is largely attributable to the decreased incidence of transposition errors in a word context. In general, the effects of the linguistic context in which a target letter is embedded depend strongly on the point in time at which the contextual information becomes available. Overall findings are discussed in terms of a theoretical "perceptual filter" model and the idea that Ss can report perceptions of a word without being aware (without showing in their behavior) that they have first identified the constituent letters. (29 ref) —*Journal abstract.*

158. Farkas, Arthur J. & Anderson, Norman H. (U California, Ctr for Human Information Processing, San Diego) **Input summation and equity summation in multi-cue judgments.** *Center for Human Information Processing Technical Report*, 1974(Dec), No. 47, 29-61. —20 undergraduates received 2 pieces of information about the work behavior of 2 persons, A and B, and divided a fixed sum between them. Input summation implies that the 2 cues should be added to produce single input values for A and for B; the ratio model of equity theory should then apply to these input values. Equity summation

implies a reverse order of integration: the ratio model of equity theory should apply separately to each dimension of input information; the 2 resulting equity ratios should then be summed to yield the final judgment. The rule of input summation was supported only when the 2 input cues were similar, defined on the same dimension. When the 2 input cues were defined along dissimilar dimensions (performance and effort), then the rule of equity summation was clearly supported. It is noted that the rule of equity summation allows for a more equitable society than does the rule of input summation. —*Journal abstract.*

159. Fischhoff, Baruch. (Oregon Research Inst, Eugene) **Hindsight is not equal to foresight: The effect of outcome knowledge on judgment under uncertainty.** *Journal of Experimental Psychology: Human Perception & Performance*, 1975(Aug), Vol 104(1)(3), 288-299. —Notes that a major difference between historical and nonhistorical judgment is that the historical judge typically knows how things turned out. 3 experiments are described with a total of 479 college students. In Exp I, receipt of such outcome knowledge was found to increase the postdicted likelihood of reported events and change the perceived relevance of event-descriptive data, regardless of the likelihood of the outcome and the truth of the report. Ss were, however, largely unaware of the effect that outcome knowledge had on their perceptions. As a result, they overestimated what they would have known without outcome knowledge (Exp II), as well as what others (Exp III) actually did know without outcome knowledge. It is argued that this lack of awareness can seriously restrict one's ability to judge or learn from the past. (16 ref) —*Journal abstract.*

160. Flekkoy, Kjell. (Gaustad Hosp, Oslo, Norway) **Semantic meaning and associative responding.** *Scandinavian Journal of Psychology*, 1975, Vol 16(2), 149-151. —Tested the hypothesis that the search for a response word in a single-word free association situation proceeds in the direction of decreasing semantic similarity between the stimulus and response words. Ss were 176 Norwegian 19-68 yr olds, the majority of whom had had only a primary school education. Semantic features were assigned to the 1st 50 Kent-Rosanoff words and each of the 3 most frequent response words to each stimulus word, obtained in a single word free association situation. An index for the number of semantic features shared by the stimulus and response words found to decrease with increasing response latency, thus confirming the hypothesis. Findings support the assumption that semantic meanings of stimulus and response words are determinants of free associative responding. —*Journal abstract.*

161. Frederiksen, Carl H. (U California, Berkeley) **Representing logical and semantic structure of knowledge acquired from discourse.** *Cognitive Psychology*, 1975(Jul), Vol 7(3), 371-458. —Presents a network model of logical and semantic structures from which speakers or writers generate linguistic messages at the discourse level. While linguistic structures were considered in developing the model, the semantic and logical networks are defined without reference to linguistic structures and thus may be used to represent knowledge structures acquired from both linguistic and nonlinguistic sources.

A 2nd problem addressed is that of determining what logical and semantic information is acquired when a text is understood. To assess acquired knowledge, a procedure is presented for coding an S's verbal reconstruction of knowledge acquired from a presented text (or other input) against the logical and semantic structure from which the text (or other input) was derived. The procedures are illustrated using data obtained from 4 kindergarteners who were asked to "retell" simple narrative stories. (39 ref)—*Journal abstract*.

165. Kosslyn, Stephen M. (Johns Hopkins U) **Information representation in visual images.** *Cognitive Psychology*, 1975(Jul), Vol 7(3), 341-370.—Explored the manner in which information is represented in visual images by conducting 5 experiments in which a total of 101 undergraduate and 3 graduate students judged whether or not various properties were appropriate for given animals. It took more time to evaluate an animal when the subjective image of it was small, whether size was manipulated directly or indirectly (e.g., by having a target animal imaged at the correct relative size next to an elephant or a fly). More time also was required if the animal was imaged in a relatively "complex" environment (next to 4 vs 2 digits painted on an imaginary wall, or next to a 16 cell matrix). Finally, subjectively larger images required more time to evoke than smaller images. Results support a constructivist notion of imagery, and the idea that images may act as "analogs" to percepts.—*Journal abstract*.

166. Loftus, Elizabeth F. (U Washington, Seattle) **Spreading activation within semantic categories: Comments on Rosch's "Cognitive representation of semantic categories."** *Journal of Experimental Psychology: General*, 1975(Sep), Vol 104(3), 234-240.—Applies a spreading-activation theory of semantic processing to data from a series of experiments by E. Rosch (see PA, Vol 54:6) in which Ss were shown 2 category members (e.g., orange, pear) and were asked to press a same key if both members belonged to the same natural category

and a different key if they did not. In some cases the pair to be judged was preceded or accompanied by a priming stimulus (e.g., the word fruit) which informed S that at least 1 of the 2 stimuli would be a fruit.

167. Mason, Mildred. (U Connecticut) **Reading ability and letter search time: Effects of orthographic structure defined by single-letter positional frequency.** *Journal of Experimental Psychology: General*, 1975(Jun), Vol 104(2), 146-166.—Conducted 4 experiments with a total of 68 6th graders to test the hypothesis that spatial redundancy (i.e., positional frequency) is a specific form of redundancy that can be used to augment visual feature information in the identification of individual letters. Ss were classified as either good or poor readers by the Wide Range Achievement Test. Results from all 4 experiments support the hypothesis and indicate that (a) spatial redundancy is more important in synthesis of the letters (target trials) than it is in search and comparison, and (b) good and poor readers are differentiated on target trials at the level of utilization of spatial redundancy but not at the level of utilization of distinctive visual features. In all 4 experiments, poor readers were consistently insensitive to the manipulated redundancy variables. Results are discussed in terms of the role of spatial information in providing the orthographic structure that facilitates reading of an alphabetic writing system and in terms of an acceptable model of letter and word recognition. (35 ref)—*Journal abstract*.

168. Mosconi, Giuseppe. (U Padova, Istituto di Psicologia, Italy) **Negation and presupposition.** *Giornale Italiano di Psicologia*, 1974(Dec), Vol 1(3), 317-329.—Recent research has emphasized the importance of presupposition in the comprehension of negative sentences. In the present 2 experiments with a total of 100 university students, it was hypothesized that there are cases in which the use of negation does not involve presupposition at all. This happens whenever the negative expression has an aim which is purely expressive, either in a rhetorical sense (rhetorical function) or in a strictly semantic sense (semantic function). In Exp I, Ss were requested to describe stimulus situations by using given expressions (grammatically positive and negative ones). Negative expressions appeared in those situations in which they fulfilled a precise semantic function, whereas they did not occur at all when they could not serve such a function. The hypothesis was also confirmed by results of Exp II in which Ss were asked to produce situations according to verbal descriptions, phrased either in positive or in negative form. (Italian summary)—*Journal abstract*.

169. Nerhardt, Göran. (U Stockholm, Psychological Lab, Sweden) **Rated funniness and dissimilarity of figures: Divergence from expectancy.** *Scandinavian Journal of Psychology*, 1975, Vol 16(2), 156-166.—Conducted 3 experiments with a total of 283 college students to test whether funniness of a stimulus could be interpreted as a function of divergence from expectancy concerning the stimulus as a member of different classes. Stimuli were combinations of 2 moving, successive, nonrepresentational figures projected onto 2 screens. Funniness of the figure to the right was rated, as was divergence in qualities between the figure to the right and the preceding one on the left. The main prediction

was that data would show a decrease after an increase in funniness with increasing divergence for a certain right-hand stimulus. An increase should reflect a series of similar classes; a decrease should reflect a transition to another series. In some instances a decrease did occur after an increase, as predicted; in others the series of combinations seemed to overlap. Funniness could be interpreted as formulated initially.—*Journal abstract.*

170. **Ortendahl, Monica.** *A comparison between scales in an information integration task.* *Göteborg Psychological Reports*, 1975, Vol 5(1), 22 p.—Judged the favorableness of offers to buy lottery tickets, using 3 methods of rating: category judgments, magnitude estimations, and graphic ratings. The lotteries varied in time, probability, and value of outcome. 2 models, one multiplicative in log form and in raw form and one addition in raw form, were tested. Magnitude estimations and graphic ratings yielded a somewhat stronger support for the multiplicative model, while neither of the 2 models could be rejected on category judgments. Similarity between offers was judged using category judgments, magnitude estimations, and paired comparisons. Category judgments and magnitude estimations gave about the same multidimensional configuration of stimuli, while the result in some degree was deviant for paired comparisons.—*Journal abstract.*

171. **Ortendahl, Monica.** *Studies on delay processes.* *Göteborg Psychological Reports*, 1975, Vol 5(4), 9 p.—Summarizes the author's previous studies of delay processes, in which the possibility of describing such processes by means of a linear model was tested. Some support was found for a linear model to describe judgments and decisions based on time of outcome as an included factor.—*Journal abstract.*

172. **Rosch, Eleanor.** (U California, Berkeley) *Cognitive representations of semantic categories.* *Journal of Experimental Psychology: General*, 1975(Sep), Vol 104(3), 192-233.—Conducted 9 experiments with a total of 663 undergraduates using the technique of priming to study the nature of the cognitive representation generated by superordinate semantic category names. In Exp I, norms for the internal structure of 10 categories were collected. In Exps II, III, and IV, internal structure was found to affect the perceptual encoding of physically identical pairs of stimuli, facilitating responses to physically identical good members and hindering responses to identical poor members of a category. Exps V and VI showed that the category name did not generate a physical code (e.g., lines or angles), but rather affected perception of the stimuli at the level of meaning. Exps VII and VIII showed that while the representation of the category name which affected perception contained a depth meaning common to words and pictures which enabled Ss to prepare for either stimulus form within 700 msec, selective reduction of the interval between prime and stimulus below 700 msec revealed differentiation of the coding of meaning in preparation for actual perception. Exp IX suggested that good examples of semantic categories are not physiologically determined, as the effects of the internal structure of semantic categories on priming (unlike the effects for color categories) could be eliminated by long practice. (57 ref) *Journal abstract.*

173. **Rossi, Bart.** (Fordham U) *Mediational effects in originality, creativity, and letter-frequency hierarchy.* *Psychological Reports*, 1975(Aug), Vol 37(1), 279-283.—Administered the Skeleton Word Test (SWT) by Tresselt and Mayzner, the Alternate Uses Test (AUT) and the Remote Associates Test (RAT) to 60 undergraduates on separate occasions. Correlations indicated that letter-frequency hierarchy as measured by the SWT was significantly related to hierarchical features explored by the AUT and RAT. Differences in magnitude of relation indicated that the AUT explored hierarchical features more like the SWT than the RAT.—*Journal abstract.*

174. **Schumacher, Ruth B.** (U Illinois, Urbana-Champaign) *The effects of instructions to mediate on recognition performance in the tactile modality.* *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 624-625.

175. **Slovic, Paul.** (Oregon Research Inst, Eugene) *Choice between equally valued alternatives.* *Journal of Experimental Psychology: Human Perception & Performance*, 1975(Aug), Vol 104(1)(3), 280-287.—Conducted 4 experiments with a total of 156 undergraduates and 17 staff members. Ss were asked to choose between pairs of alternatives that they had previously equated in value. Within each pair, one alternative was superior on an important dimension but so inferior on a lesser dimension that this disadvantage canceled its advantage. The majority of Ss resolved these choices by consistently selecting the alternative that was superior on the more important dimension. This result supports the contention that choices are determined by mechanisms that are easy to explain and justify to oneself and to others. Some practical implications of this contention are discussed.—*Journal abstract.*

176. **Thomas, Ewart A.** (Stanford U) *Criterion judgment and probability matching.* *Perception & Psychophysics*, 1975(Aug), Vol 18(2), 158-162.—Probability matching is contraindicated by the data of individual Ss, as in A. E. Dutoit's (see PA, Vol 53:10807) study and by group data, as in C. F. Creelman and W. Donaldson's (see PA, Vol 42:14776) work. In general, response frequencies are not as extreme as the corresponding stimulus frequencies. This deviation from probability matching can be accounted for by at least 2 versions of an error-correcting model in which the S's decision criterion may shift only after an error, but not by a model which permits criterion shifts after correct responses. One version of the error-correcting model allows the specification of the dependence of response frequency on payoff magnitude and on signal strength. The deviation from matching is consistent also with a model that assumes that, on each trial, the criterion shifts in the direction of the sensory information, regardless of response accuracy. This model is thus applicable to situations in which trial-by-trial feedback is omitted.—*Journal abstract.*

177. **von Wright, Johan & Meretoja, Marjaana.** (U Turku, Finland) *Encoding in anticipation of various tests of retention.* *Scandinavian Journal of Psychology*, 1975, Vol 16(2), 108-112.—135 female student nurses in Finland learned a pictorial material in anticipation of either free recall (FR), serial recall (SR), or recognition tests. A design containing all possible combinations of

anticipated test and test actually given was used. SR and recognition performance were best when Ss anticipated these tests, respectively, whereas FR performance was best when an SR test was anticipated. Anticipation of recognition tended to interfere with SR performance, and vice versa. Results indicate that Ss encoded pictorial material differently in anticipation of different retention tests, that this served to facilitate or to impair performance on the anticipated and/or other retention tests in a predictable manner, and that Ss tended to use different information from the stimuli to pass recognition tests and to pass FR or SR tests.—*Journal abstract.*

180. Wright, Patricia & Barnard, P. (MRC Applied Psychology Unit, Cambridge, England) **Effects of "more than" and "less than" decisions on the use of numerical tables.** *Journal of Applied Psychology*, 1975(Oct), Vol 60(5), 606-611.—Examined the effects of alternative decision rules on the ease of using numerical tables. 162 female Ss used tables of critical weights to determine the acceptability of packets varying in size, weight, and contents. The instructions stated either that acceptable packets weighed *more than* the critical value or that acceptable packets weighed *less than* the critical value. The *more than* acceptance rule resulted in faster performance and fewer errors than the *less than* rule. This finding is consistent with psycholinguistic research on the understanding of comparative terms. The main effect was replicated across 4 tables differing in their arrangement of information. These tables varied in difficulty, but there was no interaction with the phrasing of the acceptance rule. (18 ref)—*Journal abstract.*

181. Zagorski, Michael. (Memorial U Newfoundland, St John's, Canada) **Perceptual independence of pitch and loudness in a signal detection experiment: A processing model 2ATFC (21FC) experiments.** *Perception & Psychophysics*, 1975(Jun), Vol 17(6), 525-531.—In 2 experiments the 2-alternative temporal forced choice (2ATFC) method was used to measure the relative detectabilities of a frequency change, an amplitude increase, or both together. 2 paid undergraduates' performance was best when both (redundant) cues were available. This improvement is fit better by a decision threshold model than by an information integration model. Since decision processes that can lead to the decision threshold prediction in 2ATFC experiments are not obvious, an information processing model which does is proposed. The model makes additional predictions which fit the results of Exp II which sometimes deleted information from the 1st or the 2nd observation interval. The model is not consistent with the signal detection theory interpretation of the 2ATFC experiment, and these results call into question that interpretation. It is concluded that pitch and loudness are perceptually independent for the 2ATFC experiment.—*Journal abstract.*

182. Brehmer, Berndt; Kuylenstierna, Jan & Liljergren, Jan E. (U Umea, Sweden) **Effects of information about the probabilistic nature of the task on learning of uncertain inference tasks.** *Umea Psychological Reports*, 1975, No 90, 13 p.—Investigated the effects of information about the probabilistic nature of the task upon the performance in single-cue probability learning in 2 experiments. Results indicate that this kind of information was not sufficient to induce optimal performance. There were no differences between groups which were informed about the probabilistic nature of the task and groups which were not so informed, with respect to level of performance, number of correct hypotheses, or frequency of hypothesis shifts.—*Journal abstract.*

183. Brigell, Mitchell G.; Thompson, Charles P. & Brown, Sam C. (Kansas State U) **The importance of the within-trial interval in the superiority of the recall over anticipation method of paired-associate learning.** *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 131-133.—The magnitude of the difference between the recall and anticipation methods of paired-associate learning was shown to increase as the length of the within-trial interval increased in the recall method. Ss were 90 undergraduates. It was noted that only those studies which used short within-trial intervals fail consistently to show the recall method to be statistically superior to the anticipation method. Recall method learning rate was not affected when the within-trial interval was filled, suggesting that rehearsal is not responsible for the effect of interval. Alternate mechanisms are suggested.—*Journal abstract.*

185. Craik, Fergus I. & Tulving, Endel. (U Toronto, Canada) **Depth of processing and the retention of words in episodic memory.** *Journal of Experimental Psychology: General*, 1975(Sep), Vol 104(3), 268-294.—Conducted 10 experiments to evaluate the notion of "depth of processing" in human memory. Undergraduate Ss were asked questions concerning the physical, phonemic, or semantic characteristics of a long series of words; this initial question phase was followed by an unexpected retention test for the words. It was hypothesized that "deeper" (semantic) questions would take longer to answer and be associated with higher retention of the target words. These ideas were confirmed by the 1st 4 experiments. Exps V-X showed (a) it is the qualitative nature of a word's encoding which determines retention, not processing time as such; and (b) retention of words given positive and negative decisions was equalized when the encoding questions were equally salient or congruous for both types of decision. While "depth" (the qualitative nature of the encoding) serves a useful descriptive purpose, results are better described in terms of the degree of elaboration of the encoded trace. Finally, results have implications for an analysis of learning in terms of its constituent encoding operations.—*Author abstract.*

186. Elworthy, Josephine E. & Dutch, J. (Victoria U, Wellington, New Zealand) **The influence of errors and decision-making on learning by performance and learning by observation.** *Australian Journal of Psychology*, 1975(Apr), Vol 27(1), 41-46.—Investigated the question of whether performers and observers in an observational learning situation are affected differently by the consequences of actions taken during learning. 80 university students worked in pairs, performer and observer, and were required to identify and remember the correct member of word pairs displayed on a panel. Some Ss were exposed to completely correct performances, others to performances which included errors. All Ss were required to identify the correct members of the word pairs in a retention test. Results indicate that observers learned the discrimination as efficiently as performers, and that making decisions and errors interfered with the learning of performers but not of observers.—*Journal abstract*.

187. Gatchel, Robert J. (U Texas, Arlington) **Effects of interstimulus interval length on short- and long-term habituation of autonomic components of the orienting response.** *Physiological Psychology*, 1975(Jun), Vol 3(2), 133-136.—Tested 24 male undergraduates using interstimulus interval lengths of 20 vs 100 sec. Results indicate that the 20-sec interval length was associated with increased short-term habituation and decreased long-term habituation, relative to the longer, 100-sec interval length. There was also a statistically near-significant association between interval length and magnitude of the orienting response to a subsequently presented novel dishabituating stimulus. Results suggest the presence of 2 active habituation processes.—*Journal abstract*.

188. Imam, Afzal. (U Karachi, Pakistan) **Extraversion and incidental learning.** *Pakistan Journal of Psychology*, 1974(Dec), Vol 7(3-4), 41-54.—Tested the hypothesis, based on a previous study, that young Ss are superior to older Ss in incidental learning because they have a lower arousal state, which is related to greater extraversion in youth. To test the relationship between extraversion and incidental learning, 30 male university students learned nonsense syllables enclosed in various geometric figures. The incidental learning score consisted of matching each syllable with the figure in which it had been enclosed. The extraversion scores were based on the Eysenck Personality Inventory. Results failed to show a significant correlation between extraversion and incidental or central scores or between any 2 of the several variables investigated. (48 ref)—*M. Akhtar*.

189. Kanak, N. Jack & Rabenou, Bijan. (U Oklahoma) **Incidentally learned associations and imagery in verbal discrimination transfer.** *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 177-180.—Examined the effects of imagery (I) of List 2 right (R) items on verbal discrimination (VD) transfer. Ss were 64 undergraduates. 2 levels of I were crossed with the experimental (E) paradigm of W_1-R_1 , W_1-R_2 , and the control (C) paradigm of W_1-R_1 , W_2-R_1 . Significant negative transfer was obtained with the E paradigm when low I was employed; however, List 2 R item-high I eliminated the negative transfer effect on List 2 acquisition in the E paradigm. Results are discussed in terms of the frequency

theory of verbal discrimination and an incidental associative interference hypothesis. (16 ref)—*Journal abstract*.

190. King, David J. (State University Coll New York, Oswego) **Sex differences in learning connected discourse as a function of exposure and interitem intervals.** *Psychological Reports*, 1975(Aug), Vol 37(1), 191-194.—Studied 383 males' and 326 females' learning of connected discourse for differing exposure (0.2, 0.3, and 0.4 sec) and interitem intervals. With total presentation time constant, it was more difficult for males to learn the material when the interitem interval was greater than the exposure interval rather than the reverse. Females appeared to learn equally well under both conditions.—*Journal abstract*.

191. Labrecque, Virginia H. (U Utah) **An analysis of the relationship between the frustration effect and behavioral contrast.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 620.

192. McConkie, George W. & Rayner, Keith. (Cornell U) **The span of the effective stimulus during a fixation in reading.** *Perception & Psychophysics*, 1975(Jun), Vol 17(6), 578-586.—Developed a computer-based eye-movement controlled display system for the study of perceptual processes in reading. A study was conducted to identify the region from which skilled readers (6 paid high school juniors and seniors) pick up various types of visual information during a fixation while reading. This study involved making display changes, based on eye position, in the text pattern as the S was in the act of reading from it, and then examining the effects these changes produced on eye behavior. Results indicate that the Ss acquired word-length pattern information at least 12-15 character positions to the right of the fixation point, and that this information primarily influenced saccade lengths. Specific letter- and word-shape information was acquired no further than 10 character positions to the right of the fixation point.—*Journal abstract*.

193. McCormack, P. D. & Colletta, S. P. (Carleton U, Ottawa, Canada) **Recognition memory for items from unilingual and bilingual lists.** *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 149-151.—Predicted that recognition memory for items from bilingual lists would be superior to that from unilingual lists. Each of 72 bilingual college students, fluent in English and French, was tested on 2 unilingual and 2 bilingual lists. Each list involved a study phase of 20 targets and a test phase of these and 20 distractors. A signal-detection analysis revealed a significantly larger d' value for the bilingual than for the unilingual treatment.—*Journal abstract*.

194. McCormack, P. D. & Novell, José A. (Carleton U, Ottawa, Canada) **Free recall from unilingual and trilingual lists.** *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 173-174.—Required 3 groups of 20 French dominant female secondary school students to recall from 18-word unilingual and trilingual lists, the languages being French, English, and Spanish. For items recalled from secondary memory, 2 of the 3 groups exhibited equivalent recall from the unilingual and trilingual lists, whereas the remaining group showed superior unilingual recall. For primary memory items, all 3 groups exhibited superior recall from unilingual lists. In trilingual list recall, dominant language items were

superior in primary memory but inferior in secondary memory. These latter data were interpreted as being consistent with the notion that dominant-language items have priority in primary memory and that this produces output interference which is selective with respect to this class of items in secondary memory.—*Journal abstract.*

195. Mohs, Richard C.; Wescourt, Keith T. & Atkinson, Richard C. (Stanford U) **Search processes for associative structures in long-term memory.** *Journal of Experimental Psychology: General*, 1975(Jun), Vol 104(2), 103-121.—Conducted 2 experiments with a total of 42 female undergraduates using a symbol-element recognition task. Characteristics of the memory search processes involved in verifying symbol-element relationships were examined by analyzing the relationship between reaction time (RT) and relevant set size variables. In Exp I, Ss were tested for 4 consecutive days on the same set of lists. On positive trials (i.e., the test word was a member of the list designated by the test consonant) RT increased in a linear fashion as set size varied from 2 to 6 elements. In Exp II, Ss were tested on only 1 day; 1 group of Ss learned the symbol-element relationships as a set of lists (as in Exp I), while the other group learned them as word-consonant paired associates. Both the groups demonstrated the same general relationships between RT and set size variables; however, the magnitude of the set size effects was greatly reduced in the paired associate condition. The memory search model that provided the best account of these results assumes that Ss simultaneously access representations of both the test symbol and test element on each trial; search processes are then initiated from both representations, and whichever search terminates first determines the RT for that trial. (27 ref)—*Journal abstract.*

196. Perfetti, Charles A. & Goldman, Susan R. (U Pittsburgh, Learning Research & Development Ctr) **Discourse functions of thematization and topicalization.** *Journal of Psycholinguistic Research*, 1975(Jul), Vol 4(3), 257-271.—Conducted 2 experiments with a total of 224 Ss to test the hypothesis that (a) prompted recall of a final sentence depends on which noun prompt is thematized, (b) the effect on recall of topicalization (active vs passive) of the final sentence depends on thematization, and (c) preference for passive sentences depends on which of 2 nouns is thematized in the previous part of a passage. In Exp I, a probe recall experiment, a word with a thematized referent was a better recall probe than a word with a nonthematized referent. Also, an agent noun was a better prompt than a recipient, and this semantic variable interacted with topicalization such that a semantic recipient was a better prompt when it was topic than when it was comment. In Exp II Ss' choice between semantically equivalent active and passive sentences was influenced by thematization. Thematized nouns were chosen as topics more often than nonthematized nouns, and nouns used as paragraph titles were chosen as topics slightly more than nontitle nouns. It is suggested that twin discourse functions are served by thematization and topicalization, the former providing stable referential focus and the latter providing momentary referential focus.—*Journal abstract.*

197. Rips, Lance J. (U Chicago) **Quantification and semantic memory.** *Cognitive Psychology*, 1975(Jul), Vol

7(3), 307-340.—Considers 2 models for how people verify explicitly quantified sentences, such as *All fathers are parents* and *Some fathers are parents*. The models share the same 2nd stage but have different 1st-stage mechanisms. In the predicate intersection model, the 1st stage involves a serial, self-terminating search among names of categories that intersect the predicate category. In the feature comparison model, the 1st stage involves evaluating the overall relatedness between the subject and predicate categories by comparing their semantic features. To test the models, 3 reaction time (RT) experiments required a total of 120 paid university students to verify statements quantified by "some" or "all." In Exp I the semantic relatedness of categories in false some-statements was varied. Contrary to predictions of the predicate intersection model, related categories increased RT for both true and false some-statements. While Exp I revealed that all-statements took longer to verify than comparable some-statements, Exp II demonstrated that the all-some difference can be eliminated by presenting both statement types in the same block of trials, also disconfirming the predicate-intersection model. Finally, Exp III examined the meaning of some-statements in more detail by having Ss interpret the quantifier "some" as "some but not all." With this interpretation, some-statements took longer to verify than all-statements. Overall results support the feature comparison model. (34 ref)—*Journal abstract.*

199. Squire, Larry R.; Chace, Paul M. & Slater, Pamela C. (U California, VA Hosp, San Diego) **Assessment of memory for remote events.** *Psychological Reports*, 1975(Aug), Vol 37(1), 223-234.—Describes 2 retrospective tests which assessed remote memory for past events. Both tests asked about former television programs broadcast for a single season from 1957 to 1972. Ss were 63 24-70 yr olds and 48 11-13 yr olds. One test asked about the plots of programs, and the other for judgments about their temporal order. Results show that the information covered in the tests was acquired close to the time the programs were broadcast, since the 11-13 yr old Ss did not score above chance on questions about programs that were broadcast when they were very young. The usefulness of such tests for experimental and clinical studies of memory is discussed.—*Journal abstract.*

200. Stukuls, Henry I. (State University Coll New York, Cortland) **Clustering as determined by exposure time and spatial arrangement of objects.** *Psychological Reports*, 1975(Aug), Vol 37(1), 159-166.—Conducted 2 studies with a total of 164 undergraduates to extend the principles of clustering to nonverbal stimuli. Ss were asked to learn and recall random objects under varied conditions of exposure time (15 or 120 sec) and spatial organization. Increments in exposure time produced increments in total recall and clustering. Also the spatial organization of stimuli facilitated total recall and the organizational process in memory. The greatest amount of recall and clustering occurred with objects from the left as opposed to the right side of the visual display and

increased spatial organization of relatively random display produced increased amounts of clustering in free recall. Data are interpreted in terms of the associationistic and the mediational views of clustering. (20 ref)—*Journal abstract.*

201. **Tolin, Philip.** (Central Washington State Coll) **Effect of association value in a memory scan task.** *Psychological Reports*, 1975(Aug), Vol 37(1), 3-6.—Studied the effects of association value of nonsense forms on reaction times (RT) of 116 college students on a Sternberg-type recognition-memory task. Results indicate a linear relation between RT and length of the memorized list for high association-value forms but a nonlinear relation for low association-value forms. Data support G. E. Brigg's (see PA, Vol 53:2300) conclusions regarding the nature of the RT-list length function.—*Journal Abstract.*

202. **Twardowski, Mary M.** (U Maryland) **An investigation of the serial position effect and the effect of list length on the immediate recognition of classroom instructional material presented in lecture form.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 520.

203. **Warren, Robert E. & Hess, Michael.** (Columbia U) **On the representation of certain digit sequences in memory.** *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 213-215.—Examined the representation in memory of digit strings such as dates by observing the delays produced in color naming in a discrete-trial Stroop task when these sequences were used as carriers for the color. In Exp I, 27 undergraduates were presented on each trial with either a 4-digit sequence in color, or a patch of color, and required to name the color as quickly as possible. Digit sequence trials produced significantly longer color-naming latencies. In Exp II, with 27 Ss, 5 different types of 4-digit sequences were used: dates, odd or even series, ascending sequences, descending sequences, and repetitions. Trials using a double row of dashes in color served as the control. Only 2 types of digit series produced color-naming latencies significantly longer than those observed for dashes: dates (e.g., 1776) and odd or even series (e.g., 2468). It is argued that the significant delays over dash-trial color-naming latencies produced by these digit sequences indicated their functioning as cohesive units in memory, much like those hypothesized for letter sequences that form words.—*Journal abstract.*

204. **Wickelgren, Wayne A.** (U Oregon) **Relations, operators, predicates, and the syntax of (verbal) propositional and (spatial) operational memory.** *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 161-164.—Relational, operator, and predicate systems are distinguished on the basis that they correspond to the 3 possible pair-wise bracketings into 2 constituents of the 3 parts of a proposition: relation, subject, and object. It is asserted that the verbal propositional modality (left hemisphere) uses a predicate grammar, while the spatial image operational modality (right hemisphere) uses an operator grammar. Verbal propositional memory has the capacity for extensive propositional embedding while spatial operational memory does not.—*Journal abstract.*

205. **Yurkiw, Lubo N. & Gounard, Beverley R.** (State University Coll New York, Buffalo) **Color and noun**

imagery in free recall. *Psychological Reports*, 1975(Aug), Vol 37(1), 318.—Studied the effects of stimulus color on free recall learning by presenting 20 undergraduates with both high and low imagery noun lists printed in black, red, blue, and green. Both color and high imagery facilitated learning; however, there was no indication that color plays a role in the functioning of the visual image store.

Motivation & Emotion

206. **Ashton, R. & White, K.** (U Queensland, St Lucia, Australia) **The effects of instructions on subjects' imagery questionnaire scores.** *Social Behavior & Personality*, 1975, Vol 3(1), 41-43.—255 undergraduates, in groups of about 35 Ss, were given neutral, low, and high motivating instructions before completing the shortened form of Betts' Questionnaire upon Mental Imagery (QMI). Results for imagery scores in all 7 sensory modalities taped by this questionnaire indicate that the instructions significantly influenced Ss' responses. The data are interpreted as supporting the hypothesis that perceived desirability of claiming intense images contaminates responses on the QMI.—*Journal abstract.*

207. **Furedy, John J.** (U Toronto, Canada) **An integrative progress report on informational control in humans: Some laboratory findings and methodological claims.** *Australian Journal of Psychology*, 1975(Apr), Vol 27(1), 61-83.—Notes that when noxious unavoidable events (e.g., shocks) are signaled (e.g., by a 5-sec tone), it is widely believed that there is informational control (IC) in the sense that signaling reduces perceived event noxiousness; the IC mechanism arises through signal-elicited preparatory anticipatory responses which reduce event noxiousness; there is a preference for signaled over unsignaled events. Since these beliefs are different, relevant evidence from the Toronto laboratory is presented separately for each belief. That evidence, comprising studies published from 1970-1974 and some additional unpublished experiments, indicates (a) no support for an IC mechanism in the electrodermal, plethysmographic and cardiac response systems; (b) no support for IC itself with shocks and loud noises as noxious events; (c) no general preference-for-signaling (PFS) phenomenon (assertion based on total of over 570 Ss); but (d) a recent but consistently emerging specific PFS which appears based on Ss' (false) beliefs in the benefits of signalling. Complete integration involving a statement of the conditions under which signaling has beneficial, detrimental, and no effects is not yet possible because of the empirical complexity of the problem. 208. **Hendrick, Clyde; Vincenzo, Joe & Nelson, Cheryl A.** (Kent State U) **Formality of signature as an index of subject motivation in the psychological experiment.** *Social Behavior & Personality*, 1975, Vol 3(1), 1-4.—The psychological experiment has been characterized by M. Orne (1962, 1969) as a formal role situation which Ss take seriously. Increased seriousness may be reflected in many behaviors, even in the way in which one signs one's name. In the present study, initial sign-up names and signatures within the experiment proper were available for 2 group rating experiments with a total of 268 undergraduates. Analyses showed that 22% of all Ss used

different versions of their signature for the 2 occasions. Of this sample of changers 88% used a signature in the experiment that was more formal than their sign-up signature. These data are interpreted as in line with Orne's theorizing.—*Journal abstract.*

209. Kintz, B. L. (Western Washington State Coll) **Lying on a test and in the laboratory.** *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 207-209.—Administered a lie scale to 60 college students. 3 groups were formed according to the degree to which they responded truthfully to the statements. Ss were then individually run in a visual perception task with dissyllables being presented for short time durations. 2 response measures were taken: the latency of the 1st verbal response and the number of incorrect intrusions made during the experiment. Results show that the liars responded with shorter latencies and made more intrusions than either of the other groups. There were no differences between the truth-tellers and the medium group.—*Journal abstract.*

210. Kruglanski, Arie W. et al. (U North Carolina, Chapel Hill) **Effect of task-intrinsic rewards upon extrinsic and intrinsic motivation.** *Journal of Personality & Social Psychology*, 1975(Apr), Vol 31(4), 699-705.—Conducted 3 experiments with a total of 40 children in Grades 6-7 and 80 female and 40 male undergraduates to test the relation between the magnitude of task intrinsic rewards and the degree of intrinsic and extrinsic motivation toward the task. Based on an attributional analysis of task motivation, it was hypothesized that (a) the degree of intrinsic motivation will vary as a positive function and (b) the degree of extrinsic motivation will vary as a negative function of task-intrinsic rewards. Both predictions were supported within each of the 3 (conceptual) replications. The theoretical and practical significance of the findings are discussed. (20 ref)—*Journal abstract.*

211. Ortendahl, Monica. **Context effects on delay processes.** *Göteborg Psychological Reports*, 1975, Vol 5(2), 17 p.—8 university students rated perceived favorableness and similarity of offers to gamble in which probability, value and time of outcome varied. Context effects seemed to affect their judgment. Neither a multiplicative nor an additive model could well fit the preference ratings. The multiplicative model in raw form fitted the data badly when another function for probability was tested, which assumed that probabilities would be overestimated when low, and underestimated when high. Multidimensional scaling of individual similarity data gave somewhat varying results, but dimensions of probability, value, and time of outcome emerged in most cases. Similarity ratings showed that the subjective ratio between different ranges of probabilities did not correspond to the objective ratio.—*Journal abstract.*

212. Rubin, H. B. & Henson, Donald E. (Southern Illinois U, Carbondale) **Voluntary enhancement of penile erection.** *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 158-160.—6 22-28 yr old males, 2 of whom were experimentally experienced, developed moderate to high sexual arousal, as measured by a penile transducer, to an erotic film and, in the absence of overt erotic stimulation, to erotic fantasy. When instructed to enhance their arousal to the film without employing any

physical stimulation, 4 Ss were able to significantly increase their erections above the levels that were produced by either the film or the fantasy alone. The remaining 2 Ss, however, responded in an opposite manner in that the instructions to enhance arousal resulted in a decrease of their erections to a level below that produced by either the film or the fantasy alone. Data indicate that although attempts to voluntarily control sexual arousal may be distracting to some men, they are effective for others.—*Journal abstract.*

213. Skarżyńska, Krystyna. (U Warsaw, Inst of Psychology, Poland) **Effects of punishment and reward differing in strength.** *Polish Psychological Bulletin*, 1975, Vol 6(2), 81-87.—Tested the effects of combinations of strong reward with either weak or strong punishment, and of weak reward with either of the 2 types of punishment, on 150 female college students. The 4 reinforcement schedules were examined with respect to scope of modifications in S's behavior immediately after the punishment or reward, durability of these modifications, and the S's attitude to the person in control of reinforcement. Punishment and reward took the form of providing S with feedback on his success or failure in solving experimental problems. The consequences of success or failure differed in pleasantness or unpleasantness, depending on the expected strength of the reinforcement. Results show that (a) immediate effectiveness of the reinforcement schedule was connected with the degree of threat induced by the schedule, (b) durable modifications in behavior were effected by measures that induced a positive attitude in the S, and (c) the attitude of the S depended on the strength of the employed reinforcements.—*Journal abstract.*

214. Studenski, Ryszard. (Central Mining Inst, Katowice, Poland) **Effect of punishment and reward on performance level.** *Polish Psychological Bulletin*, 1975, Vol 6(2), 89-94.—Studied the interdependence between the efficacy and the strength of punishment and reward. 843 18-20 yr olds underwent 3 similar performance tests, of which the 2nd served also to measure level of aspiration. Punishments and rewards, administered after the 1st and 2nd tests, took the form of evaluation of 1st test performance as good, moderate, or poor. Strength of punishment and reward was manipulated by varying the extent of discrepancy between performance evaluation and aspiration level. The 3rd test measured changes effected by these manipulations. Differences in performance level were found to relate to evaluation type and strength. The largest increase in performance was noted following moderate rewards and strong punishments, the smallest following very strong rewards and moderate punishment.—*Journal abstract.*

215. Weiner, Michael J. & Samuel, William. (U North Carolina, Greensboro) **The effect of attributing internal arousal to an external source upon test anxiety and performance.** *Journal of Social Psychology*, 1975(Aug), Vol 96(2), 255-265.—Based on S. Schachter's (1962) theory of emotions as cognitive labels, it was hypothesized that (a) among high test anxious Ss (Albert-Haber Achievement Anxiety Test), those who attribute internal arousal to a pill (actually a placebo) will be less anxious and able to perform better on an anagram task than those who attribute their symptoms to the threatening

test; (b) low test anxious Ss should have their performance only slightly, if at all, affected by the attribution of arousal to a placebo, since their arousal level might not be sufficient for relabeling to occur. 33 male and 45 female undergraduates were assigned to 3 groups which received either a white pill (pill attribution condition), a pink pill (pill-no attribution condition), or no pill (control). Ss then completed the test anxiety measure, were told the "effects" of the 2 types of pills, completed checklists about the "effects" they might be feeling, and completed an anagram task and 2 other filler tests. The hypotheses were supported somewhat, but not strongly, by the anagram data. (15 ref)—*L. Gorsey.*

216. Wilner, Nancy & Horowitz, Mardi J. (U California, Medical School, San Francisco) **Intrusive and repetitive thought after a depressing film: A pilot study.** *Psychological Reports*, 1975(Aug), Vol 37(1), 135-138. —Tested a hypothesis of increased intrusive and repetitive thoughts after any undischarged negative emotional-ideational state which was based on previous experiments which involved films which aroused fear and anger. This hypothesis was extended to include a film that arouses sadness in the present study. 19 undergraduates saw a film with a separation theme and had levels of intrusions, film references, and negative affect similar to those of Ss who saw films with themes of bodily injury. —*Journal abstract.*

217. Yarbrough, Cornelia. (Syracuse U) **Effect of magnitude of conductor behavior on students in selected mixed choruses.** *Journal of Research in Music Education*, 1975(Sum), Vol 23(2), 134-146. —Investigated the effect of magnitude of conductor behavior on performance, attentiveness, and attitude of a total of 207 students in 1 university and 3 high school mixed choruses. The choruses were rehearsed under 3 conditions: with regular conductor, with high magnitude conductor, and with low magnitude conductor. Magnitude was defined *a priori* by the E and subsequently observed using the Music Conductor Observation Form developed for this study. In addition, the effect of magnitude was measured by judges' ratings of audiotaped musical performances, behavioral observation of student attentiveness, and self-report of student attitude. Results indicate no significant differences in musical performance, attentiveness, or attitude ratings among baseline and the 2 experimental conditions of high and low magnitude. However, 3 of the groups received their lowest ratings under the low magnitude condition, and data demonstrated student preference for the high magnitude conductor. —*Journal abstract.*

Attention & Consciousness States

218. Bregman, Albert S. & Rudnick, Alexander I. (McGill U, Montreal, Canada) **Auditory segregation: Stream or streams?** *Journal of Experimental Psychology: Human Perception & Performance*, 1975(Aug), Vol 104(1)(3), 263-267. —When auditory material segregates into "streams," is the unattended stream actually organized as an entity? An experiment with 13 college students suggests an affirmative answer by the observation that the organizational structure of the unattended material interacted with the structure of material to which the S was trying to attend. Specifically, a to-be-

rejected stream can, because of its structure, capture from a to-be-judged stream elements that would otherwise be acceptable members of the to-be-judged stream. —*Journal abstract.*

219. Buck, Leslie. (National Research Council, Control Systems Lab, Ottawa, Canada) **Sleep loss effects on movement time.** *Ergonomics*, 1975(Jul), Vol 18(4), 415-425. —Tested 18-22 yr old paid males on an S-paced step-tracking task 3 times every 4 hrs under both of 2 regimes: one in which they slept for 6½ hrs at night, and one in which they remained awake. 12 Ss were tested for 2 days under each condition in Exp I, and 8 Ss for 3 days in Exp II. Reaction times for correct responses increased following sleep loss to an extent inversely related to signal probability. Movement times increased following sleep loss to a much greater extent. It is concluded that movement time is a more sensitive index of performance deterioration due to sleep loss and that movement time and reaction time represent separate processes. (French & German summaries) (15 ref) —*Journal abstract.*

220. Comins, Jeffrey R.; Fullam, Francis & Barber, Theodore X. (Hamilton Coll) **Effects of experimenter modeling, demands for honesty, and initial level of suggestibility on response to "hypnotic" suggestions.** *Journal of Consulting & Clinical Psychology*, 1975(Oct), Vol 43(5), 668-675. —Pretested 180 college students on behavioral (objective) and experiential (subjective) responses to the test suggestions of the Barber Suggestibility Scale. After being exposed to 1 of 3 treatments—E modeling, hypnotic induction, or control—each S was retested on the same scale. Strong demands to give honest experiential reports were administered to ½ of the Ss under each treatment. Ss who were exposed to E modeling manifested a greater enhancement in objective responsiveness to test suggestions than control Ss and as much enhancement as Ss who were exposed to hypnotic induction. E modeling was as effective as hypnotic induction in enhancing subjective responsiveness to test suggestions with and without demands for honest reports. Under both the E modeling and hypnotic induction treatments, Ss who had initially manifested a high level of suggestibility (pretest) showed as much enhancement in subjective responsiveness to test suggestions as medium- or low-suggestible Ss. —*Journal abstract.*

221. Horowitz, Mardi J. (U California, Medical School, San Francisco) **A cognitive model of hallucinations.** *American Journal of Psychiatry*, 1975(Aug), Vol 132(8), 789-795. —Discusses the complexity of hallucination phenomena. Several psychological and biological theories of their origin have been offered, ranging from the concept of wish fulfillment, to the hypothesis of an electrochemical release of the perceptual system, to denials that hallucinatory phenomena exist. A conceptual analysis of 4 key dimensions of the hallucinatory experience (image representation, internal input into the image system of representation, impaired information processing, and sudden lapses in control over internal input to image systems) is presented in an attempt to clarify the gamut of experiences that may be called hallucinations. (37 ref)—*Journal abstract.*

222. Wiener, Earl L. & Keeley, F. Laurence. (U. Miami, FL) **Adaptive strategies in vigilance research.** *Ergonomics*, 1975(Jul), Vol 18(4), 403-414.—Discusses several possible strategies, particularly variations in the number of scored signals and the amount of change in task difficulty (gain factors). A model by which the signal detection rate can be predicted is developed, and 3 experiments test the accuracy of this model and the ability of an adaptive task to hold a constant detection rate over a 48-min vigil. (French & German summaries)

EXPERIMENTAL PSYCHOLOGY (ANIMAL)

223. Audesirk, Teresa E. (U. Southern California) **Chemoreception in *Aplysia californica*: I. Behavioral localization of distance chemoreceptors used in food-taking.** *Behavioral Biology*, 1975(Sep), Vol 15(1), 45-55.—Studied the importance of rhinophores and tentacles to distance food localization by *Aplysia californica* using a Y-maze. When food algae was placed in one area of the maze, a normal S placed in the stem almost invariably entered the correct arm in search of food. Performance was compared before and after removal of tentacles, rhinophores, on both structures. Loss of rhinophores did not affect maze performance if tentacles were intact. Loss of tentacles, however, resulted in an increase in errors even when rhinophores were present. A significant decline in performance occurred only after removal of both structures. It is suggested that rhinophores are well situated to detect odors carried by passing currents and could be used initially to alert *Aplysia californica* to the presence of food upstream. Tentacles, which are closer to the substrate and more widely separated, may then play the dominant role in locating food. (28 ref)—*Journal abstract*.

224. Barnett, S. A. & Smart, J. L. (Australian National U., Canberra, Australia) **The movements of wild and domestic house mice in an artificial environment.** *Behavioral Biology*, 1975(Sep), Vol 15(1), 85-93.—Wild house mice (*Mus musculus*) of Generations 1-5 bred in the laboratory, and a genetically mixed stock of laboratory mice (A, A2G, C57BL, and GFF), were each kept for 5 days in an artificial environment in which movement was recorded automatically. There was a central nest box, from which 4 arms projected: 1 arm contained food and 1, water; 1 arm was empty throughout; the 4th arm was empty on Days 1-3, but contained balsa wood on Days 4 and 5. Wild mice always made many more visits to the maze arms on Day 1 than on later days (response to novelty), but there was only a small excess in time spent in the arms. On Days 1-3 more time was spent in the food arm than in any other, but on Days 4 and 5 most time was spent in the arm with balsa wood. There was no evidence of the avoidance of novel objects displayed by wild rats (*Rattus norvegicus*). The only evidence of change over generations was an increase in gnawing of balsa wood by Generations 3-5.—*Journal abstract*.

225. Barrows, Edward M. (U. Kansas) **Individually distinctive odors in an invertebrate.** *Behavioral Biology*, 1975(Sep), Vol 15(1), 57-64.—In a study with sweat bees (*Lasioglossum 2 ephyrum*), males demonstrated that

females have odors which are characteristic of individuals. In a sequence of presentation of odors of individual females, male response toward odor of a given female decreased with time. However, renewed response resulted from the presentation of odor of another female. Furthermore males appear to be capable of "remembering" individual odors of females in nature, since in the laboratory they remained habituated to odors of individual females for at least 60-135 min. *Journal abstract*.

226. Castilla, J. C. (U. Chile, Santiago) **Responses of *Asterias rubens* to gravity.** *Journal of Experimental Zoology*, 1975(Sep), Vol 215(1-2), 84-94.—Using an inclined plane, starfish were studied to (a) determine the minimum slope at which

an axis occurs and (b) observe geotactic behavior in a light gradient field. The geotactic response, which occurred at 7° but not 5° or less, could be reversed by subjecting the animal to a light intensity from above producing a flux of 87.72 lux down the slope and an intensity gradient down the slope of -0.043 loge intensity CM⁻¹ units. It is proposed that the mechanism(s) responsible for the geotactic response are proprioceptor sense organs responding to the pull of the body on the podia. (French summary)—S. R. Goldstein

227. Davis, Hank; Memmont, John & Hurwitz, Harry M. (U. Guelph, Canada) **Autocontingencies: A model for subtle behavioral control.** *Journal of Experimental Psychology: General*, 1975(Sep), Vol 104(3), 169-188.

—Investigated the nature of the often surprising degree of behavioral control exerted by what are, in many cases, unscheduled and unintended relationships between important experimental events. A distinction is proposed between traditional contingencies (i.e., if event X—then event Y) and a 2nd class of relationships which are termed "autocontingencies." The logical relationships which generate autocontingencies are derived from systematic constraints in the distribution of event Y itself, which allow prediction of the subsequent occurrence or the absence of the event Y. Supportive evidence for behavioral control by autocontingencies is presented from a survey of operant and Pavlovian conditioning procedures which involve both appetitive and aversive stimuli. Conditioned suppression data from 9 male hooded Long-Evans rats are also presented to elaborate the concept of autocontingencies. These data suggest the function of "need" (i.e., the simultaneous presence of other predictors) in determining the degree of control exerted by autocontingencies. The use of the term "subtle" to describe relationships underlying autocontingencies is proposed, and the phylogenetic implications are examined. (53 ref)—*Journal abstract*.

228. Galler, Janina R. & Turkewitz, Gerald. (Massachusetts Inst of Technology) **Variability of the effects of rearing in a large litter on the development of the rat.** *Developmental Psychobiology*, 1975(Jul), Vol 8(4), 325-331.—Conducted an experiment with 20 female Sprague-Dawley rat mothers assigned small litters of 8 pups each and 5 mothers assigned large litters of 16 pups each. Ss reared in litters of 16 were stunted and delayed in the appearance of eye opening and fur eruption compared with Ss reared in litters of 8. However, the effects of the large-litter treatment were not uniform; Ss in this group exhibited markedly higher variability with

regard to all measures than did Ss from small litters. In fact, some Ss from the large litters were heavier and some exhibited developmental landmarks earlier than did most Ss reared in small litters.—*Journal abstract.*

229. Gould, Edwin. (Johns Hopkins U, Lab of Comparative Behavior) **Experimental studies of the ontogeny of ultrasonic vocalizations in bats.** *Developmental Psychobiology*, 1975(Jul), Vol 8(4), 333-346.—Notes that the ontogeny of FM pulses emitted by bats is a process of maturation that is not easily altered by experimental manipulation during early development. In the present study with *Antrozous pallidus* and *Eptesicus fuscus* bats, infants that were hand-raised and infants that were raised by mothers with altered voices (the superior laryngeal nerves were cauterized pre- and postpartum) emitted normal adult calls. Effects on the vocalizations of young Ss of pinching the superior laryngeal nerves with a cold forceps suggest that the development of this nerve and its associated musculature occurs early in the bat's postnatal life. (18 ref)—*Journal abstract.*

230. Green, James A. & Adkins, Elizabeth K. (Bucknell U) **The effects of prenatal and postnatal auditory stimulation on early vocalization and approach behavior in the Japanese quail (*Coturnix coturnix japonica*).** *Behaviour*, 1975, Vol 52(1-2), 145-154.—Studied the effects of pre- and postnatal auditory stimulation on the early behavior of quail chicks. Ss were divided into 3 groups. Group A received a tone for 4 hrs before and after hatching; Group B received a tone for 4 hrs before hatching; and Group C received no tone. In choice tests, in the presence and absence of the tone, Group A approached more frequently than Group C but less frequently than Group B. Age at testing and prior test experience had no effect. The implications of these findings for imprinting research and methodology are discussed.—*S. R. Goldstein.*

231. Herman, Louis M.; Peacock, Michael F.; Yunker, Michael P. & Madsen, Carolyn J. (U Hawaii, Honolulu) **Bottlenosed dolphin: Double-slit pupil yields equivalent aerial and underwater diurnal acuity.** *Science*, 1975(Aug), Vol 189(4203), 650-652.—Reports evidence that in bright daylight, and at best viewing distances, the dolphin resolves visual gratings approximately equally well in air and in water. Aerial resolution improves with increased viewing distance, while underwater resolution improves with decreased viewing distance. The double-slit pupil overcomes the gross myopia in air and produces the indicated effect.

232. Levitt, Lynn & Bennett, Thomas L. (William Paterson Coll) **The effects of crowding under different rearing conditions on emotionality and transfer of perceptual learning.** *Behavioral Biology*, 1975(Sep), Vol 15(1), 65-72.—80 male Charles River albino rats were either preexposed to circles and triangles in a visually sparse environment or received no early experience with the shapes. Within each early experience condition, Ss were initially placed in either a crowded or uncrowded environment. Approximately 1 mo later, half the rats under each population condition were shifted to the opposite population density condition, while the other half remained under their original condition. Data indicate that (a) Ss uncrowded for the entire experiment

were less emotional than Ss crowded for the same length of time; (b) there was no difference in emotionality produced by 1 mo vs 2 mo of crowding; (c) Ss uncrowded for 1 mo or more immediately after weaning were less emotional than Ss crowded during this interval; (d) in general, Ss preexposed to the to-be-discriminated forms learned the discrimination task in significantly fewer trials than did Ss not receiving early stimulus preexposure; and (e) Ss that were crowded 1 mo immediately after weaning were poorer performers on the discrimination learning problem than were Ss uncrowded during this same time period.—*Journal abstract.*

233. Merti, Anne S. (Oregon Regional Primate Research Ctr, Beaverton) **Discrimination of individuals by scent in a primate.** *Behavioral Biology*, 1975(Aug), Vol 14(4), 505-509.—Studied the sniffing response of captive male ring-tailed lemurs to male antibrachial and brachial secretion. When gauze pads containing secretion were presented in quick succession for 90 sec each, the test Ss were quickly habituated whether the pads were all from 1 male or each from a different male. However, if the pads were presented every 4.5 min for 90 sec each, Ss were habituated if all pads were from 1 individual and were sensitized if each pad was from a different individual. They could, therefore, distinguish between the odors from different males.—*Journal abstract.*

234. Miller, Don E. & Emlen, John T. (Washington State U) **Individual chick recognition and family integrity in the ring-billed gull.** *Behaviour*, 1975, Vol 52(1-2), 124-144.—Conducted a series of 13 field experiments on populations of ring-billed gulls (*Larus delawarensis*) to determine how parents recognize their chicks. Brood-tending adults were presented substitute chicks of various ages, or presented with their own chicks after vocal impairment or after modification of visual appearance by black ink. Introduced chicks of the same age as the resident brood were nearly always accepted during the 1st 5 days posthatching and usually rejected after the 7th day; adults presented daily with normally advancing-age substitute chicks for the 1st 8 days posthatching showed no signs of rejecting substitute chicks. Visual, but not vocal, alteration resulted in attacks on less than 3-day-old chicks by over half the parents tested. The adaptive significance and evolution of parent-offspring recognition is discussed. (German summary)—*S. R. Goldstein.*

235. Muir, Darwin W. & Mitchell, Donald E. (Queen's U, Kingston, Canada) **Behavioral deficits in cats following early selected visual exposure to contours of a single orientation.** *Brain Research*, 1975, Vol 85(3), 459-477.—Used operant methods to study the ability of 12 adult cats, whose early visual experience was confined to contours of a single orientation (either vertical or horizontal), to resolve gratings of different orientations. Following selective visual exposure during part or all of the 1st 4 mo of life, Ss were trained on a simultaneous discrimination between gratings of various orientations and blank fields of the same mean luminance. The spatial frequency of the gratings was systematically altered to obtain an estimate of acuity based upon extrapolation to chance levels of performance. Selective-

ly deprived Ss performed as well as normally reared Ss on gratings having the same orientation as that of the stripes they saw as kittens, but their performance on gratings orthogonal to these was poorer. Control Ss whose early visual experience alternated between vertical and horizontal stripes or who were reared in an environment containing randomly oriented contours, failed to show any difference in their acuity for vertical and horizontal gratings. The acuity deficits were unchanged even after 30 mo of normal visual exposure. It is argued that these perceptual deficits are a consequence of the changes in cortical physiology that other studies have found in cats who had undergone similar early visual deprivation. Findings provide a basis for explaining a number of human perceptual disorders. (44 ref) —*Journal abstract.*

236. Roper, T. J. (U Oregon) **Diurnal rhythms in the nest-building behaviour of female mice.** *Behaviour*, 1975, Vol 52(1-2), 95-103.—In Exp I, 5 female mice (strain RAP) were continuously reinforced with paper strips over an 11-day period while a 12:12 light-dark cycle was in effect. All Ss showed a marked diurnal rhythm restricting operant behavior to the dark period. In Exp II, 16 mice were allowed free access to hoppers of paper for 2 hrs/day at the beginning, middle, or end of the dark period, their nest being removed 2 hrs prior to each session. More paper was taken at the end and middle of the dark period than at the beginning. The relationship of nesting to sleep and to activity patterns is discussed. (19 ref) (German summary)—*Journal summary.*

237. Schiffman, Harvey R. & Lore, Richard. (Rutgers State U, New Brunswick) **Depth perception in the rat (*Rattus Norvegicus*): Prepotency of three-dimensional over two-dimensional surfaces.** *Perception*, 1975, Vol 4(1), 73-77.—Conducted 3 experiments to measure and compare the descent behavior to 2- and 3-dimensional surfaces in a depth situation in a total of 135 male Long-Evans hooded rats. When depth differences between surfaces were controlled, significantly more descents were made to 3- than to the 2-dimensional surface. Results suggest that a 3-dimensional surface—more representative of an animal's natural terrain—provides a more informative environment for motion parallax than does a 2-dimensional one.—*Journal abstract.*

238. Staddon, J. E. (Duke U) **Autocontingencies: Special contingencies or special stimuli? A review of Davis, Memmott, and Hurwitz.** *Journal of Experimental Psychology: General*, 1975(Sep), Vol 104(3), 189-191.—Comments on the article by H. Davis (see PA, Vol 54:6) which proposed the concept of "autocontingencies" to describe the unscheduled and unintended relations that exist between important experimental events. The need for the term "autocontingency" is questioned, the Davis proposal that contingencies related to postfood and postshock time are subtle in their effects is challenged, and the alternative possibility that the fixed CS duration means that time since CS onset is a predictor of CS offset is suggested.

239. Thorne, B. Michael; Patterson, Art S. & Topping, Jeff S. (Mississippi State U) **Behavioral differences between killer and nonkiller rats.** *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 152-154.—Compared killer and nonkiller rats on the following

behavioral measures: reactivity to handling, open-field activity divided into the number of squares traversed and rearing, defecation in the open field, and learning and retention of a discriminated avoidance response. Ss were 26 adult male Long-Evans hooded rats. In contrast to certain other reports, killer rats differed from nonkillers only in the number of rearings in the open field. On the basis of this study, killers do not appear to be more reactive than nonkillers.—*Journal abstract.*

240. Ades, César & Rodrigues, Maria A. (U Sao Paulo, Brazil) **Effect of previous exposure on response decrement induced by olfactory stimulus.** *Psychological Reports*, 1975(Aug), Vol 37(1), 271-277.—Conducted 2 experiments with a total of 31 albino Wistar rats to study the influence of pre-exposure on the decrement produced in a trained running response by a novel odor. In Exp I, when first presented in the runway, the smell led to higher running times in Ss pre-exposed 72 hrs earlier and in Ss with no pre-exposure than in a group pre-exposed 25 min earlier. There was no significant difference between the 1st 2 groups. In Exp II, 3 groups of Ss were pre-exposed, 25 min before testing in the runway, in boxes which differed in degree of similarity to the runway. Their performance did not differ significantly on test sessions. Results indicate that contact with a novel odor is sufficient to lessen its decremental effect even if it occurs outside the training situation and is not followed by reinforcement. The effects of pre-exposure dissipate with time and do not seem to depend strongly on contextual stimuli.—*Journal abstract.*

241. Benel, Russell A. (USAF School of Aerospace Medicine, Brooks Air Force Base, TX) **Intra- and interspecific observational learning in rats.** *Psychological Reports*, 1975(Aug), Vol 37(1), 241-242.—Compared the observational learning of an operant response by 12 male albino rats under 2 modeling conditions (intra- and interspecific). The interspecific models were Mongolian gerbils. There were no significant differences between the groups either in trials to acquisition or total responses. Possible limitations of the results are noted.—*Journal abstract.*

242. Boevig, R. S. & Randolph, J. J. (Abbott Lab, North Chicago, IL) **The "gambler effect": Choice and the probability of reinforcement of small response outputs.** *Psychological Reports*, 1975(Aug), Vol 37(1), 55-62.—Discusses several types of concurrent-chains studies in which preference was found disproportionate to the rate of primary reinforcement. The disproportionality was attributed to the unusual effect on preference of the smallest interreinforcement interval components of schedules of reinforcement. The present study investigated an aspect of this factor in the control of preference. Concurrently available FR-10 schedules were chained to a FR-30 schedule on one key and a multiple FR-5-FR-80 schedule on the alternative key. In the course of the study the relative frequency of the smallest interreinforcement interval (FR-5) in the multiple schedule option was reduced from 0.50 to 0. Ss (3 White Carneaux pigeons) could maximize reinforcement by always choosing the FR-30 schedule or choosing the multiple schedule and "gambling" that the FR-5 would be

produced. Ss chose the multiple schedule exclusively with one exception until the FR-5 was removed entirely from the multiple schedule. At this point, all Ss chose the fixed schedule exclusively. Preference defined as rate of initial links responding was, in most instances, inversely related to rate of primary reinforcement. (15 ref) —*Journal abstract.*

243. Bond, N. W. & Blackman, D. E. (Macquarie U. School of Behavioural Sciences, North Ryde, Australia) **Conditioned suppression of schedule-induced polydipsia in rats.** *Psychological Reports*, 1975(Aug), 63-68.—3 male Wistar rats exposed to the intermittent delivery of food reinforcement developed schedule-induced polydipsia. A tone correlated with unavoidable shocks was then superimposed upon this baseline. Ss' licking behavior was suppressed during the tone periods but remained unchanged during the no-tone periods. This suppression of licking was due to a decrease in the mean number of post-pellet licks; the percentage of intervals containing licking remaining relatively constant. When the shock intensity was increased there was a further reduction in licking behavior due to a decrease in the number of intervals containing licks. Results demonstrate that schedule-induced polydipsia can be altered by factors other than those involving the primary schedule. —*Journal abstract.*

244. Bradshaw, C. M. (U Edinburgh, Scotland) **Behavioral contrast in albino rats.** *Psychological Reports*, 1975(Aug), Vol 37(1), 287-291.—Trained 3 male albino Wistar rats on multiple VI schedules of reinforcement. When reinforcement was withheld during one of the component schedules, the reduction in response rate during that component was accompanied by an increase in responding during the other (unchanged) component. This positive behavioral contrast was statistically significant for all 3 Ss. Results are discussed in relation to interpretations of behavioral contrast based on auto-shaping phenomena. —*Journal abstract.*

245. Brownstein, Aaron J. & Balsam, Peter D. (U North Carolina, Greensboro) **A search for conditioned reinforcement effects in negative automaintenance of keypecking.** *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 165-168.—Systematically varied the relationship between pecking and keylight termination to assess possible conditioned reinforcement effects of keylight termination in negative automaintained pecking. Ss were 6 adult White Carneaux pigeons. Pecking was observed under conditions where pecking produced sustained keylight termination, brief keylight termination, or had no effect on key illumination. The proportion of trials with a peck was unrelated to the peck-termination contingency. The latency on trials with a peck was shortest in the sustained termination condition. The rate of pecking on trials with a peck was highest in the condition where termination was independent of pecking. Overall, results provide little support for the notion that keylight termination functions as a conditioned reinforcer in the negative automaintenance paradigm. —*Journal abstract.*

246. Calef, Richard S.; Calef, Ruth A.; Maxwell, Frederick R. & McHewitt, Earl R. (West Virginia Wesleyan Coll) **Positive discrimination contrasts with delay of reward or low drive.** *Bulletin of the Psychonomic*

Society, 1975(Aug), Vol 6(2), 120-122.—6 groups of 10 albino rats each were given differential conditioning training in parallel alleys differing only in brightness. Results show a positive S+ contrast effect when 20-sec delay of reinforcement or lowered drive (12-hr deprivation) were used to lower responding but a negative S+ contrast effect when Ss received both immediate reinforcement and 23-hr deprivation. No present theory can adequately explain both effects. —*Journal abstract.*

247. Campbell, Patrick E. & Cline, Mark. (Wright State U) **Extinction persistence in the rat following brief training with constant or partial delay of reward.** *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 155-157.—Trained 48 male albino Sprague-Dawley rats in a runway under 3 acquisition schedules: constant immediate reward, partial delay of reward, and constantly delayed reward. Delay occurred in the goalbox for a duration of 20 sec. Acquisition trials were given at 1 trial a day for 10 days. The constant delay group ran somewhat slower in acquisition than the other 2 groups. During extinction there were 2 treatment levels, constant confinement and no confinement. Confinement occurred in the goalbox for 20 sec, and 1 extinction trial was given each day for 24 days. Ss confined during extinction ran significantly slower than nonconfined Ss. The extinction effects of the acquisition schedules included a modest partial delay extinction effect but no evidence that constant delay caused an increase in persistence. —*Journal abstract.*

248. Dyck, Dennis G. et al. (U Manitoba, Winnipeg, Canada) **Punishment persistence and sequence: Some effects of P-length and N-length in the rat.** *Learning & Motivation*, 1975(Aug), Vol 6(3), 404-411.—Conducted an experiment with 40 male albino rats. In a runway investigation, 2 groups of Ss received partial punishment (P) training with P-lengths of 1, 2, and 3 (Group P123) and P-lengths of 1 (Group P1), respectively. 2 additional groups received partial reinforcement (N) with N-lengths of 1, 2, and 3 (Group N123) and N-length of 1 (Group N1). An additional group was given unpunished continuous reinforcement in the runway but received control shocks in a separate apparatus. Following training all Ss received punished extinction (shock plus nonreward). Results indicate that P-length increased resistance to punished extinction; however, N-length did not have the corresponding effect. In addition, partial reinforcement did not increase resistance to punished extinction relative to continuous reinforcement. Results are interpreted within a sequential-theoretical framework. —*Journal abstract.*

249. Farthing, G. William. (U Maine, Orono) **Behavioral contrast in pigeons learning an auditory discrimination.** *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 123-125.—After an initial period of nondifferential training, 14 female Silver King pigeons were trained on a go-no-go discrimination between different click frequencies. Keypeck responses during the positive stimulus were reinforced with food on a 1-min variable interval schedule, whereas responses during the negative stimulus were extinguished and prolonged the negative stimulus for 30 sec (correction procedure). Response rates in the positive stimulus increased during discrimination training in all Ss. A control group of 7 Ss given

extended nondifferential training had significantly lower response rates and contrast ratios. Results are inconsistent with a simple autoshaping theory of behavioral contrast.—*Journal abstract.*

250. Farthing, G. William. (U Maine, Orono) **Stimulus control by dot position in pigeons.** *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 185-188.—In Exp I, with 10 Silver King 6-yr-old pigeons, positive dot-position generalization gradients were obtained following training in which pecks at a white key with a black dot in a fixed position (at either the top, bottom, left, right, or center of the key) were sometimes reinforced (S+), and pecks at a blank white key were never reinforced (S-). Single-stimulus training was not sufficient to establish control by dot position. In Exp II, with 10 Silver King pigeons, 5 of which were experienced, negative dot-position gradients were obtained following training on a discrimination between S+ blank vs S-dot. Implications of these and other results for excitatory and inhibitory stimulus control are discussed.—*Journal abstract.*

251. Fisher, Caroline & Badia, Pietro. (Bowling Green State U) **Preference for signaled or unsignaled shock in goldfish.** *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 195-197.—Presented unsignaled, inescapable shocks to 5 goldfish. By making a shuttle response, Ss could change the condition to signaled shocks for 2 min, after which unsignaled shocks were automatically reinstated. All Ss changed from the unsignaled to the signaled condition. 3 different extinction conditions were administered, to assess the extent to which the shock and shock-free periods controlled changeover performance. The performance of the fish was compared with the performance of rats obtained in previous studies. This comparison showed a number of similarities. The argument, by some, that Ss choose the signaled shock condition because of modifiable shock is disputed.—*Journal abstract.*

252. Frankel, Frederick D. (U California, Los Angeles) **The role of the response-punishment contingency in the suppression of a positively-reinforced operant.** *Learning & Motivation*, 1975(Aug), Vol 6(3), 385-403.—2 experiments, employing a total of 100 male albino rats, tested the prediction from current theories of punishment that a response-contingent procedure is superior to a comparable noncontingent procedure for the administration of punishment. Results demonstrate that the 2 procedures produced comparable contiguity effects and did not contain artifacts present in previous research. 3 different measures of suppression corroborated the findings that more response suppression occurred in the contingent procedure. Results were stable across 8 days of shock administration (Exp I) and 3 levels of shock intensity (Exp II). In both experiments, response suppression occurred during contingent shocks associated with shock at offset, as well as after conditioned stimulus (CS) offset. The contingent procedure was associated with more suppression during both of these periods and also longer runs of CSs with complete suppression. The relevance of the present findings to current theories of punishment is discussed. (32 ref)—*Journal abstract.*

253. Fuenzalida, Charles E. & Ulrich, George. (U Colorado) **Escape learning in the plains garter snake,**

Thamnophis radix. *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 134-136.—5 plains garter snakes received 5 daily trials on each of 10 successive days in a water maze in which escape was possible through a hole in the correct end box. Ss showed a significant reduction in latency to escape after 2 or 3 days of training. However, Ss did not acquire a discrimination between the correct and incorrect paths since the probability of turning into the incorrect arm did not decrease over days. Reduction in escape latency could be interpreted as an arousal effect of incentive learning (i.e., Ss learned that escape was possible, and this energized behavior even though they did not learn the correct pathway). However, an alternative view is offered wherein Ss are presumed to have learned not only that escape was possible but also a systematic pattern of searching behavior (which was somewhat less efficient than could have been acquired if the position discrimination had been mastered).—*Journal abstract.*

254. Gelperin, Alan. (Princeton U) **Rapid food-aversion learning by a terrestrial mollusk.** *Science*, 1975(Aug), Vol 189(4202), 567-570.—Reports data to show that the terrestrial slug *Limax maximus* can learn to avoid new palatable food, sometimes within 3 wks, if Co₁ poisoning is paired with ingestion of the new food. The opportunity offered by the preparation for detailed neurophysiological analysis of a rapid-onset learning mechanism of long duration is noted.

255. Goodrick, Charles L. (Baltimore City Hosp. Gerontology Research Ctr, MD) **Adaptation to novel environments by the rat: Effects of age, stimulus intensity, group testing temperature.** *Developmental Psychobiology*, 1975(Jul), Vol 8(4), 287-296.—Determined adaptation of operant barpressing in a dark 2-bar test box during 2-hr tests in 4 experiments with a total of 384 singly tested Wistar albino rats 16-18, 24-32, 120-150, and 750-800 days old. Ss 16-18 days old failed to adapt during the test, although all other age groups did. Adaptation occurred more slowly for the 120-150 day old group than for the remaining 2 age groups. Experiments with the 2 youngest groups showed that bright light lowered response levels of both age groups, compared with controls, but failed to alter the course of adaptation. In contrast, group testing resulted in lowered response levels and faster adaptation for 16-18 day old Ss, but higher response levels for 24-32 day old Ss compared with singly tested controls. High temperature (32.5°C) resulted in adaptation for the 2 younger groups. The failure of 16-18 day old Ss to adapt may have been due to lower body temperature while in the test chamber than while in the home cage nest area. (17 ref)—*Journal abstract.*

256. Griffin, Patrick; Hughes, William R. & Coleman, James J. (Jackson State U) **Information integration and compounding of discriminative stimuli in pigeons.** *Perception & Psychophysics*, 1975(Jun), Vol 17(6), 555-558.—Reinforced keypecks with food in 3 male Silver King pigeons according to a multiple schedule with variable interval (VI) schedules of reinforcement associated with the components. If the key was green (G) or white with 3 horizontal black lines (H), VI 30 sec was in effect. A red key (R) or 3 black vertical lines on a white surround (V) indicated that VI 60 sec was in effect.

Following this training, a single test session was conducted in which the reinforcer was not available and in which the single stimuli and the compounds HG, HR, VG, and VR were presented. Response rates to the compounds were generally less than to the elements alone. This unexpected result was apparently due to degrading of the stimuli during superimposition. However, the compound rates aligned well with a linear model that assumes no interaction between orientation and color stimuli. This initial agreement with N. H. Anderson's information integration approach (1972) suggests further application of the model to stimulus compounding in infrahuman animals.—*Journal abstract.*

257. Grilly, David M. (Cleveland State U) **Sex differences in delayed matching-to-sample performance of chimpanzees.** *Psychological Reports*, 1975(Aug), Vol 37(1), 203-207.—Tested short-term memory for visual stimuli in 17 chimpanzees, using the delayed matching-to-sample technique. A statistically significant superiority of females in matching accuracy was exhibited over an extended period of time and under at least 2 different retention intervals (20- and 40-sec delays). Results are consistent with those obtained with rhesus monkeys on similar tasks. The possibility that the results are attributable to factors other than experience is discussed.—*Journal abstract.*

258. Hemmes, Nancy S. (City U New York, Queens Coll) **Pigeons' performance under differential reinforcement of low rate schedules depends upon the operant.** *Learning & Motivation*, 1975(Aug), Vol 6(3), 344-357.—Conducted an experiment with 6 male White Carneaux pigeons. Ss were reinforced with grain for pecking a key or depressing a foot treadle according to DRL schedules. Ss which depressed a treadle performed efficiently on DRL schedules as high as DRL 35-sec, while Ss reinforced for keypecking showed low efficiency under DRL 14-sec. While treadle pressing and keypecking differ along a number of dimensions (including force requirement of the operant and differences in temporal distributions of responses), the present results are consistent with an interpretations based on differences in the degree to which these 2 responses are elicited by periodic presentations of food. (27 ref) *Journal abstract.*

259. Holman, Eric W. (U California, Los Angeles) **Some conditions for the dissociation of consummatory and instrumental behavior in rats.** *Learning & Motivation*, 1975(Aug), Vol 6(3), 358-366.—In 2 experiments to investigate whether consummatory and instrumental behavior depend upon different motivational factors, a total of 68 female Sprague-Dawley rats were trained to press a bar for saccharin solution, then given various treatments designed to reduce the palatability of saccharin, and finally tested for barpressing in extinction and for free intake of saccharin. Prefeeding with dextrose, prefeeding with saccharin, and association of saccharin with injections of lithium chloride all reduced intake of saccharin compared to control treatments, but only prefeeding with dextrose also reduced barpressing in extinction. Thus, performance of an instrumental response may depend upon need for food rather than appetite for it. (28 ref) *Journal abstract.*

260. Janzen, William B.; Geissler, Katharina R. & Melvin, Kenneth B. (U Alabama) **Some varied effects of**

punishment on ongoing avoidance behavior in the hamster. *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 201-203.—Trained 16 male Charles River golden hamsters to avoid shock by leaving a startbox and traversing a straight alley. During the 1st extinction phase (Phase I), 1 group was given 20 regular extinction (RE) trials, while a 2nd group was given shock punishment (PE) in the center of the alley. During the last 30 extinction trials (Phase II), conditions were reversed for the groups. Unlike earlier research with other species, punishment typically suppressed running, especially in the punishment area. However, a temporary punishment-induced facilitation of alley speed was found.—*Journal abstract.*

261. Johnston, Robert E. & Zahorik, Donna M. (Cornell U) **Taste aversion to sexual attractants.** *Science*, 1975(Sep), Vol 189(4206), 893-894.—Performed a standard taste aversion experiment with 22 male hamsters, using vaginal secretion from estrous females as the taste stimulus. After presentation of the stimulus, gastrointestinal illness was induced in 11 Ss by ip injections of lithium chloride, while the other 11 Ss received saline injections. In comparison to the saline controls, Ss poisoned after ingesting the vaginal secretion showed a greater decrease in time spent licking, a greater increase in latency to lick, and left more secretion on the plate. There was a very large increase in variability among the poisoned Ss in time spent licking and in the latency to lick. Results provide evidence that the nature of the flavor does not seem to affect the ability of an animal to form taste aversions and suggest that this is true regardless of the flavor's biological functions. Data also demonstrate a change in responsiveness to a communication signal due to experience and argue against the common view that responses to pheromones are stereotyped and nonmodifiable.—*L. Gorsey.*

262. McIlwitt, Earl R. (King Coll) **The effect of prior reward magnitude on the successive negative contrast effect.** *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 126-128.—3 groups ($n = 10$ each) of Holtzman albino rats received nondifferential large (L) or nondifferential small (S), or no reward training prior to differential reward training (Groups L-LS, S-LS, and LS respectively) in a nonchoice brightness discrimination apparatus. A 4th condition ($n = 10$) received small reward in each discriminandum throughout training. Results suggest that the extent of simultaneous negative contrast was greater for Group L-LS than for Group S-LS and clearly indicate that the development of discrimination and negative contrast effects was retarded for the prior reward conditions relative to the standard differential conditioning group (LS).—*Journal abstract.*

263. Meyers, Lawrence S. & Anderson, Gary J. (California State U, Sacramento) **Acquisition and extinction following extended partial reinforcement training under small or large reward.** *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 198-200.—41 male Sprague-Dawley rats were given either 30, 90, or 300 SRT partial reinforcement trials to either a 1- or 15-pellet reward. Following both 30 and 90 trials, large reward led to faster acquisition responding and greater resistance to extinction than small reward. Following 300 trials, small and large reward groups were responding equally rapidly.

in acquisition, but the small reward group tended to be more resistant to extinction than the large reward group.—*Journal abstract.*

264. Moon, Laurie & Lewis, Paul. (Ohio U) **Effect of signal duration on preference for signalled reinforcement.** *Psychological Reports*, 1975(Aug), Vol 37(1), 263-269.—By responding on a changeover key, 2 White Carneaux pigeons could change the prevailing unsignaled VI 65-sec schedule to a signaled, but otherwise identical, schedule. On the signaled schedule a brief tone preceded reinforcement. Regardless of the duration of the signal (5, 3, 1, 0.5, or 0.1 sec), Ss strongly preferred the signaled schedule. Withdrawal of the signal produced a rapid decline in the changeover key response rate, demonstrating that production of the signaled condition maintained the responding. Results support an information hypothesis that suggests that situations in which a stimulus provides information about future events is preferred over one that does not.—*Journal abstract.*

265. Prytula, Robert E.; Lawler, Sharon M. & Davis, Stephen F. (Middle Tennessee State U) **Odor-mediated double-alternation responding: A multiple-baseline reversal demonstration.** *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 181-184.—In a 4-phase study with 16 male albino Holtzman rats, a multiple-baseline technique was used to assess the relationship between runway behavior and odor cues. Results show that behavior was controlled more by the cue property of odor than by memory. (21 ref)—*Journal abstract.*

266. Roper, T. J. (U Cambridge, England) **Nest material and food as reinforcers for fixed-ratio responding in mice.** *Learning & Motivation*, 1975(Aug), Vol 6(3), 327-343.—3 experiments, with a total of 18 albino female RAP mice, investigated the importance of operant-reinforcer distance as a factor affecting continuous reinforcement (CRF) and FR performance, with nest material and food as reinforcers. In Exp I, nest material (paper strips) was presented on a series of FR schedules of increasing size, with the operandum located as close as possible to the reinforcer dispenser. Ss compensated for increases in FR size by proportionately increasing their response output, but ratio strain occurred at low FR values. In Exp II, response rate was inversely related to operant-reinforcer distance on a CRF schedule with nest material as reinforcer. In Exp III, food was presented on a series of FR schedules at 2 levels of deprivation, and with 3 operant-reinforcer distances. Operant-reinforcer distance affected CRF response rate, degree of compensation for increases in FR size, and occurrence of ratio strain, but only when deprivation level was low. Results support the view that nest material and food share fundamentally similar reinforcing properties but that nest material is a weaker reinforcer under normal test conditions. (34 ref)—*Journal abstract.*

267. Suavedra, Maria A. (Universidad de Chile, Santiago) **Pavlovian compound conditioning in the rabbit.** *Learning & Motivation*, 1975(Aug), Vol 6(3), 314-326.—Conducted 2 experiments on eyelid conditioning in the rabbit involving compounds of isolable CSs. In Exp I, employing 16 male New Zealand white rabbits, it was demonstrated that Ss could be trained to respond discriminatively on the basis of specific configurations when no other reliable component cues were

available. In Exp II, with 8 Ss, a novel test procedure failed to provide further evidence that Ss utilized specific configurational cues when reliable isolable components were available. Findings are discussed in terms of the assumption that any stimulus compound involves both isolable and configurational components with the former being more salient than the latter. (16 ref)—*Journal abstract.*

268. Snapper, Arthur G.; Kadden, Ronald M.; Shimoff, Elliot H. & Schoenfeld, William N. (Western Michigan U) **Stimulus intrusion of fixed-interval responding in the rat: The effects of electric shock intensity, temporal location, and response contingency.** *Learning & Motivation*, 1975(Aug), Vol 6(3), 367-384.—Conducted 3 experiments with a total of 44 male Charles River CD rats. After a scalloped leverpress response pattern had developed under an FI food reinforcement schedule, a 15-sec electric shock was intruded for different groups of Ss in the 1st, 2nd, 3rd, or 4th quarter of each inter-reinforcement schedule. Shock intensity was systematically increased for individual Ss over 70 sessions, from 0.05 to 1.6 mA. Additional between-groups comparisons involved response-dependent vs clock-dependent FI schedules, and response-dependent vs response-dependent electric shock intrusion. Response rates within each FI prior to, during, and following electric shock intrusion showed regular and reproducible increases and decreases under systematic application of the experimental variables. Results provide further evidence that the functions of a stimulus are determined in part by the parameters of intensity, response contingency, and temporal location with respect to reinforcement.—*Journal abstract.*

269. Stephens, Ronald M.; Metze, Leroy P. & Craig, James R. (Auburn U) **The Protestant ethic effect in a multichoice environment.** *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 137-139.—Investigated the Protestant ethic effect using 8 albino rats that learned to barpress for food in a 4-choice situation involving: (a) a functional bar and food dish where a pellet was dispensed with each barpress, (b) a nonfunctional bar and food dish which contained no free food during training, (c) a nonfunctional bar, and (d) a foodcup which contained no free food during training. After a stable rate of responding was observed, free-food pellets were added, and the choice behavior of Ss was observed. Results indicate that Ss preferred to barpress to obtain food in the presence of other food-getting or manipulation activities.—*Journal abstract.*

270. Stewart, Warren J. (La Trobe U, Bundoora, Australia) **Progressive reinforcement schedules: A review and evaluation.** *Australian Journal of Psychology*, 1975(Apr), Vol 27(1), 9-22.—Notes that progressive reinforcement schedules have had limited use. What studies have been done show them to be valuable in testing perseverative hypotheses. Using these schedules the effects of variables that may affect perseveration, or persistence, of behavior, can be assessed. Such variables are reinforcement magnitude, motivation conditions, and physiological manipulation. Perseveration has been measured by the total number of responses or the size of the last completed ratio before responding becomes infrequent at the "break-point." Other dependent varia-

be used also to measure perseveration. The question of the effects of the food amount is discussed. The effects of the amount of food on the progressive schedules of reinforcement are discussed. The effects of various schedules of reinforcement on the potential use of these schedules are discussed. (4 ref.) *Journal abstract*

271. Wagner, James M. & Rodewald, H. Keith. *M. J. L.* Quantitative analysis of acquisition of a conditional discrimination. *Psychological Reports*, 1975(Aug), Vol 37(1), 211-216.—In a study with 1 racing pigeons, when the center 1 of 3 keys was illuminated with 1 of 6 stimuli, 40 pecks produced white light on both side keys. 3 of the 6 stimuli set the conditions for reinforcement of a subsequent single peck on the left key, and 3 occasioned reinforcement for a right-key response. The 3 Ss reached a criterion of 18 correct key responses in the last 20 presentations of each of the 6 stimuli. Prior to criterion, responding was stable and near chance levels; immediately thereafter, accuracy rose to 90% correct choices. Results of several statistical tests and good congruence with predictions of G. H. Bower's (1964) model suggest acquisition in an all-or-none manner and confirm H. K. Rodewald's (see PA, Vol 50:4519) results.—*Journal abstract*

272. Warren, Judith L.; Bryant, Rodney C.; Petty, Frederick & Byrne, William L. (Tennessee, Ctr for the Human Sciences, Memphis) Group training in goldfish (*Carassius auratus*): Effects on acquisition and retention. *Journal of Comparative & Physiological Psychology*, 1975(Oct), Vol 89(8), 933-938.—2 experiments with a total of 656 goldfish investigated the effects of group training on acquisition and retention. Ss in groups acquired an active avoidance task more readily than individually trained Ss. Unreinforced retention testing showed that individual Ss had in fact acquired the avoidance response. The addition of trained "leader" Ss to groups did not enhance acquisition performance but somewhat impeded it. It is proposed that it is the presence per se of other fish that in some manner facilitates acquisition in groups of fish and that leader-follower interactions do not account for the observed effect. (20 ref.) *Journal abstract*

273. Wong, Paul T. & Traupmann, K. L. (Trent U, Peterborough, Canada) Residual drive effects and stimulus control of eating. *Psychological Reports*, 1975(Aug), Vol 37(1), 31-38.—In a study with 12 male albino Holtzman rats which were food deprived for an initial 40-day period, 6 high-drive Ss (7-12 gm of food were subsequently given daily) failed to form a go-no-go discrimination based on differential magnitudes of reward, while 6 low-drive Ss (14-16 gm of food daily) formed a reverse discrimination. Both groups exhibited appropriate differential responding only when the absence of the stimulus (S-) associated with nonreward. During a runway test after 30 days of rehabilitation, residual drive effects as indicated by a high probability of eating and a vigorous runway performance were equally robust in both groups; but the probability of eating in the presence of the stimulus (S+) was not higher than that in the presence of S-. The absence of stimulus control of eating was attributed to the overshaw-

dowing of the discriminanda by food-related cues.

Journal abstract

274. Zanich, Mary L. & Fowler, Harry. (U Pittsburgh) Primary and secondary reinforcers as distinctive cues which acquire information value in partial-reinforcement discrimination training. *Learning & Motivation*, 1975(Aug), Vol 6(3), 299-313.—To assess the cue as opposed to incentive effect of reward, 98 male albino Sprague-Dawley rats were trained on an easy visual discrimination with food contingent on 50 or 100% of the correct responses, and white noise contingent on 0, 50, or 100% of these responses. Additionally, the 50% food and noise schedules were structured for different groups to produce positive, zero, or negative correlations of the 2 events. Although the addition of noise did not affect learning with 100% food, the slower learning observed with 50% food was increasingly offset by greater percentages of noise, with the 50% groups showing faster learning under the negative than zero correlation and faster under the zero than positive correlation. Together with supporting speech data, results indicate that a "neutral" stimulus can be substituted for food with little loss in performance. Consequently, the reinforcing effect of food is attributed in part to its function as a cue which, like noise, can increase the discriminability of the alternatives and provide information about the correctness of the response.—*Journal abstract*

Social & Instinctive Behavior

275. Crawley, J. N.; Schleidt, Wolfgang M. & Contrera, Joseph F. (U Maryland) Does social environment decrease propensity to fight in male mice? *Behavioral Biology*, 1975(Sep), Vol 15(1), 73-83.—Studied social environmental influences on the development of fighting behavior in 122 CF-1 male albino mice in relation to the necessary conspecific interactions and the critical age of such interactions. Males housed with females fought as much as isolated males, but males housed with males or with a group of males and females fought much less, indicating that the lack of male-male interactions causes the increased "isolation-induced" fighting in the test situation. Males isolated or housed with females for 1 mo showed similar fighting tendencies whether the isolation occurred during the 2nd or 3rd mo of age. This suggests that the early juvenile age is not the critical point in development of fighting, but rather that isolation from other males can increase fighting of male mice at juvenile as well as at adult ages. (32 ref.) *Journal abstract*

276. Davis, Todd M. (National Zoological Park, Office of Zoological Research, Washington, DC) Effects of familiarity on agonistic encounter behavior in male degus (*Octodon degus*). *Behavioral Biology*, 1975(Aug), Vol 14(4), 511-517.—Conducted a study of 7 adult and 2 juvenile male South American rodents, *Octodon degus*, which showed that familiarity is a source of variability in the expression of agonistic behavior. During initial encounters between unfamiliar male degus, one animal approached and mounted his partner, while the other individual retreated and enurinated. High frequencies of fighting were seen. Fighting was less frequent in subsequent pairings of the same dyad, and body sniffing

occurred more often. Later encounters were less rigidly stereotyped than initial ones.—*Journal abstract.*

277. Dobrzański, Jan & Dobrzańska, Janina. (Nencki Inst of Experimental Biology, Warsaw, Poland) **Ethological studies in the ant *Tetramorium caespitum* mayr: II. Interspecific relationships.** *Acta Neurobiologiae Experimentalis*, 1975, Vol 35(3), 311-317.—In an investigation it was found that the structure of relationships between a neighboring species of ants is characterized by great variability. What happens when particular individuals meet depends on considerable differences between individual behaviors of ants and a number of variable factors determining the actual emotional state of the workers. From these factors, it is the general structure of forces between the nests that changes slowest and may be responsible for reaching temporary stabilization of the interspecific relationships. Invariable hierarchical structure between the species occurs very rarely; when there is an enormous supremacy of one of the species. (15 ref)—*Journal abstract.*

278. Dobrzański, Jan & Dobrzańska, Janina. (Nencki Inst of Experimental Biology, Warsaw, Poland) **Ethological studies in the ant *Tetramorium caespitum* mayr: I. Foraging and building behavior.** *Acta Neurobiologiae Experimentalis*, 1975, Vol 35(3), 299-309.—Carrying heavy objects is a common element in the foraging and building behavior of ants. The initial stages of this behavior, (i.e., lifting and moving), *T. caespitum* are displayed as stereotyped patterns of movement. It was found that these patterns do not improve as the ants become more experienced, which suggests their congenital nature. Growing experience is manifested in the later stages of the transportation of heavy objects, especially in entering the correct opening of the nest with the carried prey. When a foraging ant leaves its nest to return to the prey, it initially moves in the direction of its objective. When a certain distance from the nest is reached, the ant uses olfactory stimuli to locate and follow its previous path. These observations indicate that this species does not learn an exact way to and from the nest but instead has a memory for direction. The congenital character of these elements of foraging and building behavior allows the existence of a social organization without a division of work and foraging areas. (28 ref)—*Journal abstract.*

279. Gottlieb, Gilbert. (Dorothea Dix Hosp, Raleigh, NC) **Development of species identification in ducklings: III. Maturational rectification of perceptual deficit caused by auditory deprivation.** *Journal of Comparative & Physiological Psychology*, 1975(Oct), Vol 89(8), 899-912.—In 3 experiments, mute Peking ducklings, devocalized as embryos and manipulated in auditory isolation, manifested a selective high-frequency perceptual deficit vis-à-vis the maternal call of their species at 24 hrs after hatching. Since it takes a rather specific auditory experiential input to rectify this high-frequency insensitivity at 24 hrs, it was predicted that, in the absence of auditory experience, devocalized Ss would fail to show sufficient endogenously mediated improvement to bring them up to the level of perceptual competence of vocal-communal Ss at any age. This hypothesis proved wrong in that the proportion of devocalized Ss showing a preference for the normal

maternal call over the >825-Hz attenuated one, became equivalent to the vocal Ss at 48 hrs after hatching, as did their ability to discriminate the normal maternal call from >1,800-Hz attenuated maternal call. At 65 hrs, however, the devocalized Ss' performance deteriorated back to the level observed at 24 hrs. It is concluded that embryonic exposure to the (sibling) contact-contentment call prevents the perceptual deficit at 24 hrs and the deterioration at 65 hrs.—*Journal abstract.*

280. Ishay, Jacob. (Tel Aviv U, Sackler School of Medicine, Israel) **Caste determination by social wasps. Cell size and building behaviour.** *Animal Behaviour*, 1975(May), Vol 23(2), 425-431.—Oviposition and cell-building activities were studied experimentally in 2 species of Vespinae (social wasps): *Vespa orientalis* and *Paravespula germanica*. Queen-right and queenless colonies were allowed to oviposit into and raise brood within comb cells that were smaller than, equal to, or larger than normal. Transfer of eggs of 1st to 3rd instar larvae from worker cells to queen cells resulted in the development of queens, while the reverse transfer resulted in the production of workers. Evidence is presented to suggest that in Vespinae, the cell size determines the caste of the developing brood. The workers, possibly under the influence of queen pheromones, actively determine the various castes of the future generation by their treatment of the brood or of the cells which house it.—*Journal abstract.*

281. Kalberer, William D. & Coleman, Warren R. (California State U, Chico) **Development of fighting behavior in mice: Effects of experiential factors.** *Psychological Reports*, 1975(Aug), Vol 37(1), 7-10.—26 isolate-reared male Chico mice showed progressively shorter latencies to fight concomitant with weekly, brief social encounters. Ss exposed to male peers showed shorter latencies than males exposed to female peers. Possible effects of cage size and/or visual experience are discussed. It is suggested that the effects of various life histories upon aggression be investigated. (23 ref)—*Journal abstract.*

282. Kleiman, D. G. (Smithsonian Inst, National Zoological Park, Washington, DC) **The effects of exposure to conspecific urine on urine-marking in male and female degus (*Octodon degus*).** *Behavioral Biology*, 1975(Aug), Vol 14(4), 519-526.—Recorded the urine-marking, defecation rates, and urine-sniffing behavior of 7 male and 7 female degus in an open field whose substrate was clean (control tests) or covered in conspecific urine (experimental tests). Ss were exposed to these conditions intermittently over a 3-mo period. Males urine-marked more than females. Both sexes exhibited increased levels of urine-marking and defecation during control tests as time passed. Males showed decreased urine-marking and defecation rates when exposed to the urine of conspecific males, but no changes in these behaviors with female urine. Females increased urine-marking rates when exposed to female urine but exhibited no changes with male urine. Results are discussed with reference to degus social organization and the factors influencing scent-marking behavior. (21 ref)—*Journal abstract.*

283. Lloyd, James A. (U Texas, Medical School, Program in Reproductive Biology & Endocrinology,

Houston) **Social structure and reproduction in two freely growing populations of house mice (*Mus musculus* L.).** *Animal Behaviour*, 1975(May), Vol 23(2), 413-424.—In 1 population regulated primarily by a decline in birth, decreased births were associated with a reorganization of the territorial system. In the 2nd population the major factor regulating further growth was mortality of infants and young adults. Mortality was associated with a 7-fold increase in aggression and redistribution of breeding females. (30 ref)

284. Menzel, Emil W. & Halperin, Stewart. (State U New York, Stony Brook) **Purposive behavior as a basis for objective communication between chimpanzees.** *Science*, 1975(Aug), Vol 189(4203), 652-654.—Conducted 2 experiments with 6 5-7 yr old wild-born chimpanzees. They had had extensive experience on similar delayed response experiments, and effective leadership behavior was observed even on the 1st day of the experiments. Results indicate that the rate at which a chimpanzee approached a hidden, distant goal varied according to social conditions and according to whether the goal was a novel object or food. This behavior furnished a social group with sufficient information for simultaneous and successive discriminations between leaders and between goals. *Journal abstract.*

285. Mykutowycz, R. & Hesterman, E. R. (CSIRO, Div of Wildlife Research, Canberra, Australia) **An experimental study of aggression in captive European rabbits, *Oryctolagus cuniculus* (L.).** *Behaviour*, 1975, Vol 52(1-2), 104-123.—Studied the aggressive behavior of wild and domestic New Zealand white European rabbits by introducing a strange animal into the home pen of another rabbit. All possible combinations of sex and type of breed were made during 580 tests, in which incidents of chasing, biting, rippling, and mounting were recorded. In general, home rabbits defeated introduced rabbits and aggression was found to be equally prevalent in both sexes. The domestic animals exhibited less aggression but more mounting than the wild type. The effects of domestication on aggressive and sexual behavior are discussed. (19 ref) (German summary) —S. R. Goldstein

286. Naumann, Martin G. (U Connecticut) **Swarming behavior: Evidence for communication in social wasps.** *Science*, 1975(Aug), Vol 189(4203), 642-644.—Observed swarms of 15 species of wasps and found that their behavior at sites around swarms and along emigration routes suggests the use of odor marks. Wasps performed breaking runs through swarms, resulting in dispersal of clustered wasps. Orientation in flight of swarm mates to specific trail sites facilitated swarm emigration to the new nest. *Journal abstract.*

287. Reventlow, Iven. ["Body language" with animals.] (Danish) *Psykologisk Skriftserie*, 1973, No 4, 26-35.—Reviews findings of ethologists on the use of body language in the animal kingdom (e.g., mating and territory claiming in silver gulls and stickleback fish). Fake combat between small boys is discussed.

288. Ryan, Virginia & Wehmer, Francine. (Wayne State U) **Effect of postnatal litter size on adult aggression in the laboratory mouse.** *Developmental Psychobiology*, 1975(Jul), Vol 8(4), 363-370.—Examined growth, emotionality, food competition, and aggression in Swiss-Webster mice nursed in 15 litters of 3 or 9 and

reared in isolation until testing. Ss from large litters were lighter at weaning and in adulthood and were more emotional in the open field than Ss from small litters. They did not win more food competition tests than Ss from small litters, although their consummatory behavior during food competition tests was greater. Ss from large litters were more aggressive in initial encounters but over repeated encounters became more submissive. In a 2nd open-field test, emotionality of large-litter Ss was reduced more than that of Ss from small litters. When later placed in group-living cages, Ss from small litters sustained less long-term physical assault than Ss from large litters. High correlations were found between the 4 measures of brief aggression. (24 ref)—*Journal abstract.*

289. Simon, Armando. (Wichita State U) **Chemoreception in *Betta splendens*.** *Psychological Reports*, 1975(Aug), Vol 37(1), 97-98.—4 adult male Siamese fighting fish (*Betta splendens*) were kept visually and chemically isolated for 21 days in individual glass beakers with no aeration or drainage. Ss were then transplanted to each other's beakers (their "habitats"), which retained the water "contaminated" by the original S and were observed for signs of aggressive display. No sign of displaying occurred.—*Journal abstract.*

PHYSIOLOGICAL PSYCHOLOGY

290. Audibert, A. & Perrotet, E. [Hypothalamic hormones and the central nervous system.] (Fren) *Annales Médico-Psychologiques*, 1975(Apr), Vol 1(4), 451-470.—Reviews the literature relating endocrine gland activity to the CNS via hypothalamic hormones and neurotransmitters. It is clear that the interactions of these chemo-mediators are far from being completely understood. No specific neurotransmitter is exclusively concerned in the control of a specific hormone. Quite different controls can be exerted, also, by the same neurotransmitter when acting at the synaptic level of multisynaptic pathways. It is questioned whether it is the perturbation of endocrine function which disrupts the CNS in psychopathological subjects or, whether inversely, these are only the reflection of a basic CNS disorder. A more complete understanding of the interdependence of these systems, now slowly emerging from experimental study, should permit the rapid development of rational and effective therapies. (80 ref)—H. E. King

This process produced protein patterns

which fell into 2 groups, one with 1 band and the other with 2 bands. Intraspecific differences in proteins from the lens nuclei of mammals have not been reported before. Electrophoretic separation of nuclear lens proteins may be applied to study the biochemical-genetic basis of behavior.—*Journal abstract.*

297. **Ter Haar, M. B. & MacKinnon, P.C.** (Inst of Psychiatry, London, England) **Changes in (³⁵S)methionine incorporation into protein of the rat brain during puberty.** *Brain Research*, 1975, Vol 85(3), 535-538.—Findings from a study with Wistar rats show that (a) over the 1st 20 days of life, there was a marked decrease in the relative incorporation of [³⁵S]methionine into protein in the various cerebral areas of male, female, and neonatally androgenized Ss; and (b) from 20 to 60 days of age, there was a linear increase in relative incorporation which was greater in the preoptic area and the median eminence than in the amygdala. Results support previous evidence which indicated the development of the hypothalamus during puberty, together with a possible role played by the amygdala, bringing about the initiation of cyclicity in the female.

298. **Valenzuela, Wilfredo R.; Klinger, Allen & McDonald, John S.** (U California, Los Angeles) **Pattern recognition applied to monitoring waveforms.** *IEEE Transactions on Bio-Medical Engineering*, 1975(Jan), Vol 22(1), 18-24.—Demonstrated that fetal heart rate (FHR) patterns can be classified by algorithmically determined linear discriminants. A nonparametric learning algorithm was applied to 17 samples of 5-vectors. The coordinates of each sample vector were visual features derived from the FHR curve and the simultaneous uterine contraction pressure data in accord with medical training literature. Data were obtained from strip-chart recordings from the Cedars-Sinai Medical Center, Los Angeles, where an FHR monitoring and on-line computer processing system based on an IBM System/7 is being installed. The algorithm converged to linear discriminants that correctly classified all the 17 training samples under 4 different combinations of initial weights, training sequence, and correction increment. Each of the 4 linear decision rules so obtained was applied to 14 new sample vectors. 3 classified 11 samples correctly and 1 classified 13 samples correctly. Medical anomalies (atypical data) were present in all 3 misclassified patterns. A perfect success record was found in classifying all 7 medically ominous new sample vectors.—*Journal abstract.*

299. **Wahlsten, Douglas.** (U Waterloo, Canada) **Genetic variation in the development of mouse brain and behavior: Evidence from the middle postnatal period.** *Developmental Psychobiology*, 1975(Jul), Vol 8(4), 371-380.—Assessed 6 inbred strains and 3 F₁ hybrid crosses of mice for developmental status at 32 days after conception (about 13 days after birth). Phenotypes measured included body weight, brain weight, maturity of 14 reflexive behaviors, myelination of 80 fiber tracts, and thickness of the external granular layer of the cerebellum. All measures of brain and behavior showed a similar pattern of results: hybrids were generally more advanced than either of their inbred parent strains; differences among inbred strains were large, but differences among hybrid crosses were quite small. Acceleration

tion of F₁ Ss compared to their homozygous relatives ranged from 0.5 to 2.4 days mean difference. Developmental ages of inbred litters ranged from 28.7 to 32.2 days, whereas hybrid litters ranged from 31.5 to 32.7 days. (20 ref)—*Journal abstract*.

300. Wax, Teena M. & Goodrick, Charles L. (Baltimore City Hosp, Gerontology Research Ctr, MD) Voluntary exposure to light by young and aged albino and pigmented inbred mice as a function of light intensity. *Developmental Psychobiology*, 1975(Jul), Vol 8(4), 297-303.—Young (5 mo) and old male mice (23 and 26 mo) of the inbred A/J and C57BL/6J strains ($N = 80$) were isolated in ventilation chambers with ad lib food and water for 1 wk at a time. Each S was allowed to select its own lighting schedule by pressing one lever to turn on a light of either 10.76 or 166.40 lux illumination intensity and pressing another lever to turn the light off. 3-way analyses of variance for Age, Strain, and Illumination effects on parameters of barpressing, stimulus change, and light duration patterns per circadian period (24 hrs) indicated that old Ss were less active than young Ss and the A/J Ss were less active than C57BL/6J. Young Ss spent more time in the dark than old Ss, and the A/J albino Ss spent more time in the dark than did the C57BL/6J pigmented Ss. Other age and strain differences were noted as well and are discussed with respect to some theories of light exposure by nocturnal animals. (16 ref)—*Journal abstract*.

303. Barnett, Ann B.; Ohlrich, Elizabeth S.; Weiss, Ira P. & Shanks, Betty. (Children's Hosp Research Foundation, Washington, DC) Auditory evoked potentials during sleep in normal children from ten days to three years of age. *Electroencephalography & Clinical Neurophysiology*, 1975(Jul), Vol 39(1), 29-41. Recorded auditory evoked potentials (AEPs) to clicks of moderate intensity in 130 normal sleeping children aged from 10 days to 3 yrs. Latencies of the principal response components were found to decrease with log age (i.e., change was most rapid during the 1st yr of life). Variance was quite high, especially at younger ages. The finding that decreases in the latencies of the various components occurred at different rates suggests that the components reflect quasi-independent neural substrates. The components of shortest latency displayed the weakest relationship to age. Findings with respect to latency for the subset of data obtained during Stage 2 sleep were similar to those for the total population which contained responses recorded during several sleep stages. The amplitude of AEP components increased with age except for N₁ P₁, which decreased. The maturation of the

morphology of the AEP was characterized by a relative increase in the prominence of the long latency components, especially the development of P₂. It is concluded that AEPs can be a useful tool in the study of central nervous system development and in the diagnosis of sensory and neurologic abnormalities. (French summary) (44 ref)—*Journal summary*.

304. Brězinová, Vlasta. (U Edinburgh, Scotland) The number and duration of the episodes of the various EEG stages of sleep in young and older people. *Electroencephalography & Clinical Neurophysiology*, 1975(Sep), Vol 39(3), 273-278.—Examined the number and duration of episodes of any one electrophysiological sleep stage and of intervening wakefulness in 10 young normal Ss (mean age 22) and in 14 late middle-age normal people (mean age 55). No significant difference between the 2 age groups was found for any of the stages in the mean number of episodes taken from 4 nights. For any of the stages, the individual numbers of episodes accumulated over the 4 nights varied widely and showed significant consistency with similar data obtained in another set of 4 nights. There were significant differences between the 2 age groups in episode duration. The sleep of the older group contained significantly higher proportions of longer episodes of wakefulness and drowsiness and significantly lower proportions of longer episodes of slow wave sleep and REM sleep. (U Washington, Medical School) Cerebral cortex neurons with extra spikes: A normal substrate for epileptic discharges? *Brain Research*, 1975, Vol 83(3), 498-503.—Reports evidence of various types of repetitive firing patterns and the existence of double spikes appearing during otherwise rhythmic discharges in "fast" pyramidal tract neurons in response to steady depolarizing currents. It is concluded that the extra spike mode may play an important part in the epileptogenic cerebral cortex. (30 ref)

306. Church, M. W. et al. (San Diego State U) Changes in frequency and amplitude of delta activity during sleep. *Electroencephalography & Clinical Neurophysiology*, 1975(Jul), Vol 39(1), 1-7.—Applied modified period analysis to all-night sleep recordings from 14 22-27 yr old males. The modifications involved addition of measures of integrated amplitude and of time in frequency band to the zero crossings and zero counts of the 1st derivative. Changes in the characteristics of delta activity (0-3 c/sec) across the night were examined. Delta shifted toward lower frequencies and decreased in amplitude as sleep progressed. These trends were apparent in mean values for successive periods of slowwave sleep (SSWPs). For epochs of record classified as Stage 4 EEG, these trends were seen both within and across SSWPs. The physiological significance of these changes is unknown; however, it is suggested that they may reflect the kinetics of the metabolic processes underlying sleep. 307. Courchesne, Eric; Hillyard, Steven A. & Galambos, Robert. (U California, San Diego) Stimulus novelty, task relevance and the visual evoked potential in man. *Electroencephalography & Clinical Neurophysiology*

gy. 1975(Aug). Vol 39(2), 131-143.—Recorded visual evoked potentials from 18 normal college students performing in a visual discrimination task. Ss counted the number of presentations of the numeral 4 which was interposed rarely and randomly within a sequence of tachistoscopically flashed background stimuli (numeral 2s). Intrusive, task-irrelevant (not counted) stimuli were also interspersed in the sequence of 2s; these stimuli were of 2 types: *simples*, which were easily recognizable, and *novels*, which were completely unrecognizable. The *simples* and the counted 4s evoked posteriorly distributed P₁ waves (latency 380-430 msec) while the irrelevant *novels* evoked large, frontally distributed P₁ waves (latency 360-380 msec). These large, frontal P₁ waves to *novels* were also preceded by large N₁ waves. Findings indicate that the P₁ wave is not a unitary phenomenon but should be considered in terms of a family of waves, differing in their brain generators and in their psychological correlates. (French summary) (23 ref)—*Journal summary*.

309. Dobson, Vernon. (Brunel U, Uxbridge, England) **Pattern learning and the control of behavior by all-inhibitory neural network hierarchies.** *Perception*, 1975, Vol 4(1), 35-50.—Describes an all-inhibitory network which learns by selective disconnection of synapses. It is simpler than an associative net in that its neurons do not need to perform arithmetical operations, and the net does not require additional threshold modulating neurons in order to cope with input patterns which are incomplete, or of differing sizes. An "all-connected" net is described which has the holograph-like capacity to reconstruct the whole of an input pattern from part patterns without involving delays or threshold devices. All of these inhibitory nets can construct themselves by means of simple random growth processes, without incurring any loss of learning capacity of holographic properties. Similarly, synapses can be allowed to potentiate with use, so that reaction times are progressively reduced by practice, without any reduction in the quality of the performance. A description is given of a model, inhibitory hierarchy consisting of interconnected arrays which can learn to execute programs of behavior by means of a simple "putting-through" procedure. (Albert Einstein Coll of Medicine, Yeshiva U) **Intracellular study of auditory evoked activity in pericruciate cortex of the awake, nonparalyzed cats.** *Brain Research*, 1975, Vol 85(1), 69-73.—Presents data which demonstrate a consistent auditory evoked excitatory postsynaptic potential in only 1 of 21 intracellularly recorded elements of pericruciate cortex of awake, nonparalyzed cats. Data contrast with those

obtained with chloralose anesthetized Ss and suggest that chloralose has a significant facilitatory effect on auditory inputs to the motor cortex.

311. Fischer, Burkhardt; Kruger, Jürgen & Droll, Wolfgang. (Neurologische Universitätsklinik, Abteilung für Neurophysiologie, Freiburg, W Germany) **Quantitative aspects of the shift-effect in cat retinal ganglion cells.** *Brain Research*, 1975, Vol 83(3), 391-403.—A sudden displacement of a pattern, even when far away from the classical border of a concentrically organized receptive field, elicits a transient excitatory response in on- and off-center retinal ganglion cells (shift-effect). Peak response and latency of the shift-effect were studied under various stimulus conditions in on- and off-center ganglion cells. Increasing the retinal distance between the site of stimulation and receptive field yielded responses of increasing latency corresponding to an intraretinal conduction velocity of about 0.18 m/sec. Beyond a distance of 20° response amplitudes decreased steadily in on- and off-center neurons. Shift amplitude and contrast of the shifting grating had almost no influence above a threshold of 30 min of arc and 10-20% modulation, respectively (all-or-none behavior). Shifts of decreasing velocity (600-10°/sec) increased the latency. The response magnitude decreased only at very slow movements. Possible functional significances in relation to eye movements and brightness perception and the retinal pathway of the shift-effect are discussed. (20 ref)—*Journal abstract*.

312. Freeman, Walter J. (U California, Berkeley) **Parallel processing of signals in neural nets as manifested in the EEG.** *International Journal of Man-Machine Studies*, 1975(May), Vol 7(3), 347-369.—Uses experimental data from cat and rabbit olfactory system EEG waves, evoked potentials, and unit activity to construct and test dynamic models from nonlinear differential equations. An hypothesis is presented on the neural sensory coding of odors in a parallel processing mode, and a form of limit cycle activity is postulated to occur at a crucial step in sensory coding. (27 ref)

313. Frost, Barrie J. & Kaminer, Jehuda J. (Queen's U, Kingston, Canada) **The orientation of anisotropy and orientation constancy: A visual evoked potential study.** *Perception*, 1975, Vol 4(1), 51-58.—Conducted 2 experiments with 4 young adults on the orientation anisotropy in which averaged visual evoked potentials (VEPs) were recorded from the occipital scalp. Exp I confirmed L. Maffei and F. W. Campbell's (see PA, Vol 46:523) finding that obliquely oriented gratings alternated back and forth produced smaller amplitude VEPs than when the gratings were oriented horizontally or vertically. Since no asymmetry was found in VEPs produced by a Julesz figure presented under identical conditions, it is concluded that direction of displacement could not have been contributing to the effect. In Exp II head tilt of the S was manipulated together with grating orientation; the results indicate that the orientation anisotropy was retinally rather than gravitationally referenced. It is concluded that the site of orientation constancy is located either at higher levels of the primary visual system or in the 2nd visual system. (29 ref)—*Journal abstract*.

314. Galambos, Robert et al. (U California, San Diego) **On hemispheric differences in evoked potentials to speech stimuli.** *Electroencephalography & Clinical Neurophysiology*, 1975(Sep), Vol 39(3), 279-283.—8 Ss listened to lists of speech sounds (*pa* or *ba*) or pure tones (250 or 600 c/sec). Within each list 1 of the sounds (the "frequent") occurred more often than the other (the "target") in a ratio of approximately 4 : 1. Ss were required to count the targets in each list; concurrently, evoked responses to both targets and frequent were being separately averaged from electrodes at vertex at symmetrical left and right parietal locations. The evoked responses show the expected sequence of deflections at all 3 electrode sites, including large P₁ waves (about 350 msec latency) to the target stimuli. However, the left and right hemispheric responses to speech to tones, either frequent or target, were strikingly similar, both to the eye and according to statistical tests. (U Tokyo, Faculty of Medicine, Japan) **Impulse discharges from flocculus Purkinje cells of alert rabbits during visual stimulation combined with horizontal head rotation.** *Brain Research*, 1975, Vol 87(1), 66-72.—In a study with 23 adult albino rabbits, recordings from flocculus Purkinje cells in alert Ss showed that visual stimulation combined with head rotation caused an immediate modification of both their simple and complex spike activities. Implications of the findings for the construction and operation of the rabbit's cerebello-vestibulo-ocular system are examined. (19 ref)

316. Gibson, John M.; Beitel, Ralph E. & Welker, Wally. (U Wisconsin, Madison) **Diversity of coding profiles of mechanoreceptors in glabrous skin of kittens.** *Brain Research*, 1975, Vol 86(2), 181-203.—Examined stimulus-response (S-R) profiles of 35 single mechanoreceptive afferent units having small receptive fields in the glabrous forepaw skin of 24 anesthetized domestic kittens. It was found that with respect to any of the S-R transactions studied, the properties of the sample units were continuously and broadly distributed. When the entire range of responsiveness of units to the entire stimulus battery was analyzed, no justifiable basis for designation of discrete categories of S-R profiles was found. Data argue against the usefulness of evaluating a unit's S-R coding capabilities by means of a limited set of stimulation or response analysis procedures. (66 ref) —*Journal abstract*.

317. Hazemann, P.; Audin, G. & Lille, F. (Hôpital Pitié-Salpêtrière, Lab de Physiologie, Paris, France) **Effect of voluntary self-paced movements upon auditory and somatosensory evoked potentials in man.** *Electroencephalography & Clinical Neurophysiology*, 1975(Sep), Vol 39(3), 247-254.—Studied the effect of voluntary self-paced movements on auditory (AEPs) and somatosensory (SEPs) evoked potentials according to the temporal relationship between movement and delivery of test stimuli. EPs were recorded in 7 adult Ss and averaged in 10 successive epochs extending from 880 msec before to 2,500 msec after movement. AEPs were attenuated in all epochs. The decrease was greatest in the 220 msec epoch just following movement and involved components N85 and P170. SEPs were attenuated similarly to AEPs when

movements were performed by the hand contralateral to somatosensory stimulation. Of the 5 SEP components, only P40 failed to reflect the attenuation, while P95 showed the greatest amplitude decrease. When stimulation was ipsilateral, SEP amplitude was attenuated only when close to the movement. In all Ss results are consistent for treatments of AEP and SEP (with contralateral movements), whereas large interindividual differences were observed for the SEP with ipsilateral movements. (U Massachusetts, Computer & Information Science, Amherst) **Biology of decisionary and learning mechanisms in mammalian CA3-hippocampus: A review.** *International Journal of Man-Machine Studies*, 1975(May), Vol 7(3), 413-437.—Discusses aspects of mammalian hippocampal biology that seem most relevant to brain modelers' questions about circuit-level decisionary and learning mechanisms and general functional roles. Sections are included on hippocampal anatomy and electrophysiology, overall functions, memory processes, afferent information, pathology, and ontogeny and ethology. (5 p ref)

320. Le Moal, M. & Cardo, B. (Université Bordeaux 1, Laboratoire de Psychophysiologie, Talence, France) **[Rhythmic slow waves and multi-unit activity during sleep-waking in the rat ventral tegmentum.]** (Fren) *Electroencephalography & Clinical Neurophysiology*, 1975(Aug), Vol 39(2), 183-192.—Recorded gross and multi-unit activity (MUA) in different structures during various stages of sleep in 43 male Sprague-Dawley rats. The records were made by means of telemetry from lateral hypothalamus, nucleus ruber, formatio reticularis, dorsal hippocampus, and the ventral mesencephalic tegmentum (VMT) surrounding the nucleus interpeduncularis. The records during paradoxical sleep showed slow rhythmic theta waves located in the VMT and the dorsal hippocampus. In these 2 structures the MUA was mainly organized in periodic patterns of discharges. In the other structures a continuous increment of the basic level of discharge was superimposed on the periodic patterns. The similarity of the hippocampal and VMT records supports the hypothesis that the VMT region has anatomical and functional connections with the limbic system. (34 ref)—*English summary*.

(U Calgary, Div of Medicine, Canada) **Analysis of motor conduction velocity in the human median nerve by computer simulation of compound muscle action potentials.** *Electroencephalography & Clinical Neurophysiology*, 1975(Sep), Vol 39(3), 225-237.—Used a digital computer to reconstruct compound muscle action potentials recorded from the human thenar eminence after stimulation of the median nerve. Data from 4 Ss suggest that a careful analysis of the differences between pairs of compound muscle action potentials may provide a method for more detailed

assessment of conduction velocity in clinical studies of peripheral nerve disorders. (French summary) (28 ref)

322. Lennberg, E. H. (Ed). (Cornell U) **Language and brain: Developmental aspects.** *Neurosciences Research Program Bulletin*, 1974, Vol 12(4), 513-656. —Summarizes contributions and discussions of a work session held in November, 1972, on brain functions, their development in animals and man, and the implications of this research for language development and communication. Topics included are as follows: electrical stimulation in man; regulation and CNS plasticity; grammar; American sign language; language disorders; motor coordination; development of visual space, reaching and speech; linguistic knowledge, ear preference, and speech perception; cognitive development; and vocalization in birds and squirrel monkeys. Comments and epilogue are provided by the session chairman and editor. (20 p ref) *B. Preilowski*.

323. Lidsky, T. I.; Buchwald, N. A.; Hull, C. D. & Levine, M. S. (U California, Medical School, Mental Retardation Research Ctr, Los Angeles) **Pallidal and entopeduncular single unit activity in cats during drinking.** *Electroencephalography & Clinical Neurophysiology*, 1975(Jul), Vol 39(1), 79-84. —Previous studies have shown that pallidal units display changes in firing rate during food seeking and consummatory behavior. The present study determined which properties of the ingested material or ingestive behavior were most potent in altering unit activity. Single unit activity was recorded in the globus pallidus and entopeduncular nucleus of 4 male awake restrained cats during introduction of fluid into the mouth. A very high proportion of pallidal and entopeduncular neurons showed changes in firing rate during fluid injection. 2 patterns of response were observed. Typically, responses were phasic and time-locked to the occurrence of fluid presentation. Less frequently, a long lasting change in firing occurred which persisted throughout the period of fluid introduction. Other findings suggest that both of these changes in firing rate are related to the sensory rather than the motor aspects of ingestion. (French summary) (17 ref) —*Journal summary*.

324. Lille, F.; Audin, G. & Hazemann, P. (Hôpital Pitié-Salpêtrière, Lab de Physiologie, Paris, France) **Effects of time and tasks upon auditory and somatosensory evoked potentials in man.** *Electroencephalography & Clinical Neurophysiology*, 1975(Sep), Vol 39(3), 239-246. —Examined auditory evoked potentials (AEPs) recorded from the vertex and somatosensory evoked potentials (SEPs) recorded from the somatosensory and motor areas and vertex during visual and auditory discrimination tasks, with and without motor responses, and during motor tasks alone in 19 normal human Ss in 2 experiments. AEPs were minimally influenced by time, but very sensitive to task. The SEP amplitude decreased considerably with time and less with task. There was evidence for a Time \times Task interaction. The magnitude of SEP attenuation in time was reduced by intervening rest periods. The sensory modality in which the discrimination task was performed did not influence the effect on EPs. A discrimination task involving a motor response reduced EPs more than a pure discrimination or a pure motor task. The task effect seems to involve a general

mechanism (load imposed upon the S) not dependent on the particular sensory channel used to deliver the relevant information. (French summary) (19 ref) —*Journal summary*.

325. Lugaresi, E. et al. (U Bologna, Clinica delle Malattie Nervose e Mentali, Italy) **Snoring.** *Electroencephalography & Clinical Neurophysiology*, 1975(Jul), Vol 39(1), 59-64. —Presents data from 8 male 27-63 yr old heavy snorers who underwent nocturnal polygraphic recordings. Findings suggest the existence of significant polygraphic analogies between snoring and hypersomnia with periodic apneas and indicate that snoring may represent the 1st phase in the development of this syndrome. (French summary)

326. Mortimer, James A. (U Minnesota, Medical School) **Cerebellar responses to teleceptive stimuli in alert monkeys.** *Brain Research*, 1975, Vol 83(3), 369-390. —Recorded discharges of single Purkinje cells in the intermediate and lateral zones of the cerebellar cortex and of neurons in the interpositus and dentate nuclei in 4 alert rhesus monkeys during the presentation of intense auditory and visual stimuli (96-112 db sound bursts and wide-field flash illumination of 7,500 candle power sec). Concomitant monitoring of the EMG demonstrated that these stimuli evoked characteristic startle responses in most instances. Firing patterns of cerebellar nuclear cells to auditory stimuli were categorized into 4 types, the most common of which consisted of a short-latency acceleration of discharge, followed by a decrease in activity, and in most cells by a later period of facilitation. Except for a longer latency, the discharge pattern evoked by the flash stimuli was identical to that evoked by sound. It is suggested that the similar discharge patterns of cerebellar neurons to auditory and visual input results from a convergence of these inputs on a structure which projects to the cerebellum as mossy fibers. (Baylor Coll of Medicine, Houston, TX) **REM sleep and contingent negative variation development.** *Electroencephalography & Clinical Neurophysiology*, 1975(Aug), Vol 39(2), 201-204.—3 right-handed young adults demonstrated the ability to respond in a contingent negative variation (CNV) paradigm during REM sleep. However, the CNV did not appear as it does in the waking state. This failure of the CNV to develop during REM sleep may be attributed to electrophysiological changes accompanying REM sleep. (French summary) (17 ref)—*Journal summary*.

331. Soltysik, S.; Hull, C. D.; Buchwald, N. A. & Fekete, T. (U California, Mental Retardation Ctr & Brain Research Inst, Los Angeles) **Single unit activity in basal ganglia of monkeys during performance of a delayed response task.** *Electroencephalography & Clinical Neurophysiology*, 1975(Jul), Vol 39(1), 65-78.—Recorded single unit activity from the basal ganglia (caudate, putamen, and globus pallidus) of 3 monkeys (*Macaca nemestrina*) during a delayed-response task. The task was divided into 5 epochs: stimulus onset, delay, preresponse postresponse, and reward. A high percentage of units recorded from the basal ganglia showed significant changes in activity during 1 or more epochs. Examination of the proportion of units excited or inhibited during a particular epoch indicated that brief increases or decreases in unit firing rates occurred "in phase" in both pallidum and caudate. Longer-lasting firing rate changes, however, tended to occur in opposite directions in these 2 structures. This latter finding is interpreted as representing the consequence of persistent increases or decreases in activity of inhibitory interneurons in the caudate nucleus. (French summary) (26 ref)—*Journal summary*.

332. Squires, Kenneth C.; Squires, Nancy K. & Hillyard, Steven A. (U Illinois, Champaign) **Decision-related cortical potentials during an auditory signal detection task with cued observation intervals.** *Journal of Experimental Psychology: Human Perception & Performance*, 1975(Aug), Vol 104(1)(3), 268-279.—Recorded cortical-evoked potentials from 5 normal young adults performing an auditory detection task with confidence rating responses. Ss were experienced in making psychophysical judgments. Unlike earlier studies that used similar procedures, the observation interval during which the auditory signal could occur was clearly marked by a visual cue light. By precisely defining the observation interval and, hence, synchronizing all perceptual decisions to the evoked potential averaging epoch, it was possible to demonstrate that high-confidence false

alarms are accompanied by late-positive P₁ components equivalent to those for equally confident hits. Moreover, the hit and false alarm evoked potentials were found to covary similarly with variations in confidence rating and to have similar amplitude distributions over the scalp. In Exp II (with the same Ss) the signal intensity was increased to make signal presence and absence clearly discriminable and the a priori probability of signal presentation was varied from .5 to .9; it was demonstrated that correct rejections can be associated with a P₁ component larger than that for hits. Thus it was possible to show, within the signal detection paradigm, how the 2 major factors of decision confidence and expectancy are reflected in the P₁ component of the cortical-evoked potential. (29 ref)—*Journal abstract*.

333. Tamásy, Veronica; Korányi, L. & Lissák, K. (Medical U Pécs, Inst of Physiology, Hungary) **Multiple units in brain stem and forebrain during the first week of life in the rat.** *Experimental Neurology*, 1975(Jul), Vol 48(1), 29-36.—Recorded multiple unit activity in newborn, 5-day-old, and adult unanesthetized and succinylcholine-immobilized CFY strain rats ($N = 30$). The development of neuronal responsiveness of mesencephalic reticular formation and basal forebrain area was studied to various sensory modalities. It was found that both neuronal populations responded to acoustic and visual stimulation by significant increase in the frequency of amplitude discriminated discharges as early as the 1st wk of life. Somatosensory stimulation elicited a strong activation of both brain regions in new born Ss, and this type of responsiveness decreased during development. It is proposed that the neonatal central nervous system is capable of processing sensory information. The high level of somatosensory responsiveness is of great importance in the survival of the newborn animal, possibly because this is the neuronal mechanism underlying elementary learning processes and memory formation. (30 ref)—*Journal abstract*.

334. Terashima, Shin-ichi & Goris, Richard C. (Tokyo Medical & Dental U, Medical School, Japan) **Tectal organization of pit viper infrared reception.** *Brain Research*, 1975, Vol 83(3), 490-494.—Recorded infrared and visual potentials of the facial pits of pit vipers which have been shown to be temperature-sensitive receptors innervated by warm fibers of the trigeminal nerve and respond to infrared radiation. Results suggest that, in spite of the topical organization visible in the tectum opticum, the organization and correlation for behavioral action of the visual and infrared sensory modalities take place not in the area studied, but elsewhere in the brain.

335. Trehub, Arnold. (VA Hosp, Psychology Research Lab, Northampton MA) **Adaptive pattern processing in the visual system.** *International Journal of Man-Machine Studies*, 1975(May), Vol 7(3), 439-446.—Proposes a neuronal network capable of learning pattern discrimination. Basic characteristics largely reflect well established physiological principles, and the neurons' individual plastic properties are consistent with recent findings concerning visual experience and synaptic changes detected by electron microscopy. Pattern discrimination within the network is robust under rather severe input pattern degradation.—*Journal abstract*

337. Yoshida, Shigeru; Iwahara, Shinjuro & Nagamura, Neichi. (Tokyo U of Education, Japan) **The effect of stimulus orientation on the visual evoked potential in human subjects.** *Electroencephalography & Clinical Neurophysiology*, 1975(Jul), Vol 39(1), 53-57.—In an experiment with 4 male undergraduates, the average evoked potential (AEP) produced by a stationary grating of high dark-bright contrast, recorded from the occipital scalp, was less in amplitude when it was presented obliquely than when it was oriented horizontally or vertically, and in addition the amplitude was more variable for the oblique orientation. The Wiener-filtered average method (described by T. Nogawa et al, 1973) was more sensitive to these inequalities than the conventional averaging. No orientation effect upon the AEP latency was observed. Results are discussed in relation to perceptual and neuronal responses. (French summary) (18 ref)—*Journal summary*.

338. Zeigler, B. P. (U Michigan, Logic of Computers Group) **Statistical simplification of neural nets.** *International Journal of Man-Machine Studies*, 1975(May), Vol 7(3), 371-393.—Cites the investigation by E. M. Harth et al (1970) of the "neuron gas" or "netlet" models of neuron nets in which pools of neurons are represented by statistical aggregates. Employing the present author's theory of model simplification, conditions are provided under which such neuron gas models validly represent the dynamic behavior of the parent neural net.

339. Zhirmunskaya, E. A. et al. (USSR Academy of Medical Sciences, Inst of Neurology, Moscow) **Correlation analysis of EEG changes during recognition of images of objects.** *Electroencephalography & Clinical Neurophysiology*, 1975(Sep), Vol 39(3), 255-259.—Presents results of both psychological and electrophysiological experiments conducted with 15 normal Ss using the method of cross-correlation analysis of EEGs recorded during recognition of tachistoscopically presented images of objects. Changes in the random component C of the cross-correlation were larger during recognition than during simple mobilization of the S's attention. (French summary) (24 ref)—*Journal summary*.

Physiological Processes

340. Carskadon, Mary A. & Dement, William C. (Stanford U, Medical School) **Sleep studies on a 90-minute day.** *Electroencephalography & Clinical Neurophysiology*, 1975(Aug), Vol 39(2), 145-155.—After 2 adaptation and 2 baseline all-night sleep recordings, 5 normal undergraduates were placed on a schedule alternating 60 min of wakefulness and 30 min of sleep for 5/24-hr periods. A 2-day recovery period followed. One male S (MA) was later placed on the identical protocol except that he was allotted periods of 75 min of wakefulness and 15 min of sleep during the experimental period. One male narcolepsy-cataplexy patient was placed on the 60/30 min schedule for 48 hrs. REM sleep occurred within 10 min of sleep onset (SOREMP) on 79 of 110 REM sleep occasions in the 5 normals, on all 29 REM episodes in MA, and on 16 of 17 REM periods in the narcoleptic. In the normals, REM sleep showed a

tendency to recur on alternate 90-min cycles, while in the narcoleptic REM occurred on consecutive periods. Compared to baseline, REM sleep 24 hr was decreased in the normals and increased in the narcoleptic. Time spent in slow wave sleep and Stage 2 was also reduced in the normal Ss on the 90-min schedule, and Stage 1 sleep time was increased. Except for SOREMPs, no signs of the narcolepsy-cataplexy syndrome were seen in any of the normal Ss. (French summary) (20 ref)—*Journal summary*.

341. Galluscio, Eugene H. et al. (US Air Force Academy) **Changes in rat brain morphology and adrenal size as a function of environmental stress.** *Journal of Biological Psychology*, 1974, Vol 16(2), 26-31.—28 male albino Sprague-Dawley rats were subjected to chronic controlled environmental stress (CES) and uncontrolled environmental stress (UES). The CES Ss could avoid or escape a footshock by a lever press in an operant conditioning chamber. Footshock for the UES Ss was controlled by the CES Ss to which they were yoked. The CES condition significantly increased adrenal gland weight but the UES condition did not. UES tended to decrease occipital and sensory-motor cortex thickness, but CES did not affect cortical thickness. The 2 stress conditions had opposite effects on the anterior hypothalamus; CES tended to increase and UES to decrease anterior hypothalamic size.—*Journal abstract*.

342. Hall, Warren G. & Blass, Elliott M. (Johns Hopkins U) **Orogastric, hydrational, and behavioral controls of drinking following water deprivation in rats.** *Journal of Comparative & Physiological Psychology*, 1975(Oct), Vol 89(8), 939-954.—Studied drinking and its associated behaviors in 168 female Sprague-Dawley rats deprived of fluid for 8, 24, or 48 hrs. The behavior of Ss drinking water could be divided into 3 successive stages: (a) an initial intense burst of drinking that could not be easily disrupted; (b) intermittent drinking, often distinguished by the brief appearance of conflict behavior directed at the drinking spout; and (c) termination of drinking. Drinking stopped well before the fluid loss, reflected in a sizable extracellular deficit, was restored. Intake of water was terminated when serum hyponatremia and hypoosmolality (and presumably cellular overhydration) developed in temporal contiguity with drinking. These and other considerations suggest that the cellular fluid phase exerts significant inhibitory as well as excitatory control over drinking. (42 ref)—*Journal abstract*.

343. Kamel, Freja; Mock, Edward J.; Wright, William W. & Frankel, Arthur I. (State U New York, Binghamton) **Alterations in plasma concentrations of testosterone, LH, and prolactin associated with mating in the male rat.** *Hormones & Behavior*, 1975(Sep), Vol 6(3), 277-288.—Conducted 2 studies to investigate the hormonal response of a total of 58 male Sprague-Dawley rats to sexual activity. In Study 1 no evidence of a chronic elevation in plasma levels of testosterone (T), luteinizing hormone (LH), or prolactin (PRL) was observed in sexually experienced Ss compared to naive controls. Both groups showed an acute increase in plasma levels of all 3 hormones following mating, but the increases shown by the experienced group were more pronounced. In Study 2 plasma levels of T, LH, and PRL

rose in sexually experienced Ss following an exposure to a mating arena whether it contained an estrous female, an anestrus female, or no other animal. However, the increases were considerably larger in the group exposed to estrous females. It is suggested that plasma hormones rise in anticipation of mating, although not to the same extent as following mating, and that the anticipatory rise may function to initiate or facilitate mating behavior. (30 ref)—*Journal abstract*.

344. Kaplan, Barry B. & Sirlin, J. L. (U Southern California, E. P. Andrus Gerontology Ctr, Lab of Neurobiology) **Macromolecules and behavior: II. Training induced alteration in leucine transfer RNA of goldfish brain.** *Brain Research*, 1975, Vol 83(3), 451-468. —Trained goldfish to swim upright after a polystyrene float had been attached ventrally. The effects of training on the amino acid acceptor activity and methylated albumin-kieselguhr column chromatography profile of several brain isoaccepting transfer RNA (tRNA) species were studied. Comparison of the kinetics of aminoacylation and chromatography profile of tRNAs from trained and control fish showed no differences for arginyl-, glutamyl-, glycyl-, histidyl-, lysyl-, phenylalanyl-, seryl-, threonyl- or valyl-tRNA. In contrast, training induced alterations in leucine tRNA (tRNA^{Leu}) activity and activity profile. Training had no effect on brain amino acid pools or liver tRNA^{Leu} activity. Together, behavioral control experiments and plasma cortisol titers indicated that the training-induced increase in tRNA^{Leu} activity was not caused by stress, exertion, random disoriented swimming, or minor surgical procedures. Rather, this activity change seems to correlate with some, as yet unidentified, aspect of behavioral training. Implications for learning are discussed. (63 ref)—*Journal abstract*.

345. Nagy, Z. Michael; Murphy, James M. & Ray, Donald. (Bowling Green State U) **Development of behavioral arousal and inhibition in the Swiss-Webster mouse.** *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 146-148. Examined the development of behavioral arousal in 180 9-100 day old Swiss-Webster mice. An inverted U-shaped ontogenetic activity curve was obtained, consistent with past studies of other altricial rodents. However, the peak in the activity curve for the mouse occurred at 13 days of age, at least 2 days earlier than reported for the rat and hamster. Findings are interpreted as indicating that the onset of behavioral inhibitory capacities occur earlier in the mouse and are discussed in relation to development of brain stem arousal and forebrain inhibitory biochemical systems. (22 ref)—*Journal abstract*.

346. Oosterveld, W. J. & Greven, A. J. (U Amsterdam, Netherlands) **Flight behaviour of pigeons during weightlessness.** *Acta Oto-Laryngologica*, 1975(Mar-Apr), Vol 79(3-4), 233-241. Reports experiments conducted with pigeons subjected to weightlessness during parabolic flights in an airplane. Ss were observed in their normal state, as well as with hooded eyes, bound legs, and a combination of both of these handicaps. Results suggest that birds are able to fly in weightless conditions. Elimination of the information about direction induced by gravity provokes a flight behavior that suggests that illusions induced by weight-

lessness in man and birds are similar. (French & German summaries) (44 ref)—*L. Gorsey*.

347. Pavlina, Zelimir & Sarić, Ivan. (Yugoslav Academy of Sciences & Arts, Inst for Medical Research, Zagreb) **The interrelationship among three measures of physical stress: Absolute heart rate, relative heart rate and ratings of perceived effort.** *Reports from the Institute of Applied Psychology, U Stockholm*, 1975, No 56, 10 p. —Attempted to determine which of 2 objective measures of physical stress—absolute or relative heart rate—is more closely correlated with the S's ratings of perceived effort. 24 healthy males, 18-48 yrs old, were asked to pedal a bicycle-ergometer after heart rate measurement. Each S was instructed to work as long as possible. The initial load on the pedals was 100 kpm/min, and every 4 min the load was increased to 200 kpm/min. The load increases were carried out without interference with the pedalling and without Ss' knowledge. At the end of each 4-min period, heart rate was determined, and each S rated his perceived effort. Measured heart rates were converted to relative values. Thereafter, correlations between absolute heart rate and effort ratings and between relative heart rate and these ratings were investigated. Results indicate that S's perception of his own effort was more closely correlated to relative than to absolute heart rate. (18 ref)—*Journal abstract*.

348. Richardson, John H. & Fueston, Vernon M. (Old Dominion U) **Response of two strains of mice to increased social contact and decreased personal space as measured by fluorometric analysis of corticosterone.** *Psychological Reports*, 1975(Aug), Vol 37(1), 124-126. —Subjected 22 CF-1 (passive) and 22 CFW male mice (aggressive) to variations in cage size and population for 14 days. Ss were then sacrificed and blood plasma analyzed for corticosterone, a hormone known to increase during periods of stress. CFW mice showed a significant difference in hormone level between groups while CF-1 Ss did not.—*Journal abstract*.

349. Wu, Wu-tien. [Effects of stimulus changes on HR OR.] (Chin) *Bulletin of Educational Psychology*, 1973(Jun), Vol 6, 91-112. —Investigated the effects of stimulus changes on orienting reflex (OR) and the relationship between 2 indices of heart rate (HR). 78 undergraduates were given 32 standard stimuli (STST) and 4 interpolated test stimuli (TST). The STSTs for all Ss were a meaningless oral word (verbal stimulus, VS) and a circle (figure stimulus, FS). The TSTs for Group 1, the control group, was the same as the STST. For Group 2, the title of the S's department (VS) and an ellipse (FS). For Group 3, the S's name (VS) and a triangle (FS). Results show that (a) there was no group difference in the magnitude of OR to the changes of verbal and figure stimulus; (b) as a rule, the magnitude of OR evoked by an oral verbal stimulus was greater than that evoked by a figure stimulus, and (c) there was no significant relationship between the 2 indices of HR. (25 ref)—*English abstract*.

Psychophysiology

350. Bahill, A. Terry & Stark, Lawrence. (U California, Berkeley) **Overlapping saccades and glissades are produced by fatigue in the saccadic eye movement system.** *Experimental Neurology*, 1975(Jul), Vol 48(1),

95-106.—Experimental results in human Ss suggest that the effects of fatigue could explain some of the variations between and spread within published data for velocity vs amplitude of human saccadic eye movements. It is proposed that measuring the resistance to eye movement fatigue could become either a common clinical tool for diagnosing specific or general disease states, or a research tool for studying dyslexia or fatigue. (33 ref)

351. Hord, D. J.; Tracy, M. L.; Lubin, A. & Johnson, L. C. (US Naval Health Research Ctr, San Diego, CA) **Effect of self-enhanced EEG alpha on performance and mood after two nights of sleep loss.** *Psychophysiology*, 1975(Sep), Vol 12(5), 585-590.—14 18-22 yr old male volunteers were divided equally into experimental (alpha-contingent auditory feedback) and yoked control (pseudofeedback) groups. All Ss received feedback plus performance and mood tests (e.g., serial counting task, tone discrimination, State-Trait Anxiety Inventory, Williams Word Memory Test, Lorr-McNair Mood Scale, and Johnson and Myers's Primary Affect Scale) during 3 baseline days and following 2 days and 2 nights without sleep. Feedback was given for 45 min in the morning and afternoon, preceding performance and mood tests. The self-enhanced alpha (experimental) Ss produced more alpha than the yoked controls during feedback sessions. One mood and 2 performance scores showed significantly less sleep-loss decrement for the self-enhanced alpha group. 2 recall scores and an anxiety score showed more impairment for the self-enhanced alpha group following sleep loss. The differences were not significant, however, by the conservative Dunn-Bonferroni multivariate criterion, so results are not conclusive. It is concluded that alpha enhancement may help maintain performance that requires continuous attention, such as counting and auditory discrimination, but does not ameliorate the sleep-loss effect for anxiety, memory, and addition. (20 ref)—*Journal abstract*.

352. Johnson, L. C.; Townsend, R. E. & Wilson, M. R. (US Naval Health Research Ctr, San Diego, CA) **Habituation during sleeping and waking.** *Psychophysiology*, 1975(Sep), Vol 12(5), 574-584.—Studied EEG and autonomic habituation during Stage 2 sleep, REM, and awake periods in 46 17-23 yr old males. Repeated presentations of the same stimulus to the same Ss during sleep and when awake permitted evaluation of habituation between tone sets within Stage 2, REM, and awake, and from sleep to awake. Ss were exposed to 800 Hz, 75 db, 1- or 2-sec tones, presented in sets of 20 tones. During sleep, there was no habituation of the EEG response. Habituation occurred for both finger pulse response (FPR) and heart rate response (HRR) during Stage 2, with no evidence of within-stage, between tone set habituation. No significant habituation occurred during REM for HRR or FPR. Evoked skin resistance during REM was unresponsive but all other variables showed habituation. Tones presented during the night had no effect on the awake response. (26 ref)

Journal abstract.

353. Klorman, Rafael; Wiesenfeld, Alan R. & Austin, Mary L. (U Rochester) **Autonomic responses to affective visual stimuli.** *Psychophysiology*, 1975(Sep), Vol 12(5), 583-590.—32 undergraduates were categorized as

high or low in fear of mutilation by Klorman's Mutilation Questionnaire. These Ss viewed 6 slides each from 3 categories: neutral, incongruous, and mutilation. As predicted fearful Ss' cardiac responses to mutilation were acceleratory and their counterparts' deceleratory. Both groups reacted to incongruous stimuli with heart rate deceleration. Unexpectedly both samples displayed cardiac acceleration to the neutral category. Respiratory patterns of initial expiration characterized low-fear Ss whereas inspiration was typical in the high-fear group. However, respiratory activity did not vary over slide types. The high-fear sample emitted electrodermal responses of greater amplitude and slower recovery to mutilation slides than to the other categories. In both respects, the high-fear sample exceeded their counterparts. Finally, fearful Ss exhibited a more pronounced tendency to judge mutilation slides more aversive than incongruous or neutral materials. In general, responses to mutilation materials indicated reactions of defense in fearful Ss and orientation in low-fear Ss. (20 ref)—*Journal abstract*.

354. Langevin, R.; Stanford, A. & Block, R. (Clarke Inst Psychiatry, Toronto, Canada) **The effect of relaxation instructions on erotic arousal in homosexual and heterosexual males.** *Behavior Therapy*, 1975(Jul), Vol 6(4), 453-458.—Examined sexual arousal in 21 homosexual and 21 heterosexual males at least 18 yrs old under control and relaxation conditions. Ss were shown slides of males, females, and sexually neutral materials while penile circumference was monitored. Verbal ratings of physical sexual arousal and pleasantness were also recorded. Results show no significant difference for penile responses to the nonpreferred sex and neutral slides. However, both homosexual and heterosexual Ss responded significantly more to their preferred sex under the relaxation condition than the control condition. Verbal ratings of sexual arousal and pleasantness did not discriminate between relaxation and control conditions, but homosexual Ss' ratings of sexual arousal were significantly larger for slides of males than females and, in turn, larger for slides of females than neutral slides. All their pleasantness ratings were positive. Heterosexual Ss found only slides of females sexually arousing and rated slides of males as unpleasant.—*Journal abstract*.

355. Loveless, N. E. (U Dundee, Scotland) **The effect of warning interval on signal detection and event-related slow potentials of the brain.** *Perception & Psychophysics*, 1975(Jun), Vol 17(6), 565-570.—Examined the amplitude of a slow potential wave in the EEG during performance by 7 paid undergraduates of a signal detection task under several fixed intervals between warning signal and critical signal. It was observed that the probability of detecting the critical signal decreased as the interval increased, and that this effect was due to a change in sensitivity rather than a change in criterion. The time-course of the change in sensitivity was related to that of the slow potential wave, which peaked shortly after the warning signal and then declined over a period of several seconds, and is interpreted as a component of the orienting response. It is suggested that the mechanism whose function is reflected in this wave also accounts for some effects of

foreperiod duration and warning signal characteristics in reaction time tasks. (30 ref)—*Journal abstract.*

356. Peretti, Peter O. & Swenson, Kathy. (Kennedy-King Coll, Chicago, IL) **Effects of music on anxiety as determined by physiological skin responses.** *Journal of Research in Music Education*, 1974(Win), Vol 22(4), 278-283.—200 college students, divided equally by sex and music vs nonmusic major, were administered a pencil-maze test and told their performances were incorrect until they showed anxiety, as reflected in increased GSR. When music was introduced to the experimental situation, music majors of both sexes showed a significantly greater decrease in anxiety than nonmusic majors, with differences being greater among females than males.—D. S. Higbee.

357. Reinking, Richard H. & Kohl, Marilyn L. (Washington State U) **Effects of various forms of relaxation training on physiological and self-report measures of relaxation.** *Journal of Consulting & Clinical Psychology*, 1975(Oct), Vol 43(5), 595-600.—Examined the relative effectiveness of 4 types of relaxation training using electromyograph (EMG) and self-report measures of relaxation as dependent measures. Ss were 50 undergraduates. The experimental groups were (a) classic Jacobson-Wolpe instructions, (b) EMG feedback, (c) EMG feedback plus Jacobson-Wolpe instructions, and (d) EMG feedback plus a monetary reward. These groups were compared with each other and a no-treatment control group over 3 baseline and 12 training periods. All groups reported increased relaxation, but EMG measures showed that in speed of learning and depth of relaxation the EMG groups were superior to the Jacobson-Wolpe group, and the control group did not master relaxation at all. (20 ref)—*Journal abstract.*

358. Ruchkin, D. S.; Sutton, S. & Tueting, P. (U Maryland, Medical School, Baltimore) **Emitted and evoked P300 potentials and variation in stimulus probability.** *Psychophysiology*, 1975(Sep), Vol 12(5), 591-595.—There have been a number of reports of a cerebral potential occurring at about the time of an expected but absent stimulus when absence provided significant information for the S. This potential consists primarily of a positive peak occurring with a latency of about 300 msec with respect to the time of stimulus absence and is referred to as an emitted P300 potential. It has been conjectured that the emitted P300 is a manifestation of the same process that underlies the evoked P300. Evidence from 7 21-31 yr old males supporting this hypothesis is provided by demonstrating that both the evoked and emitted P300 potentials are similarly affected by variation in event probability. A paradigm was used in which click presence and absence provided information. The relative probability of click presence and absence was experimentally manipulated. Both evoked and emitted P300 amplitude responded in the same way to event probability, larger for the less frequent event and smaller for the more frequent event. (24 ref)—*Journal abstract.*

359. Watts, J. M. (Royal Edinburgh Hosp, Scotland) **Anxiety and the habituation of the skin conductance response.** *Psychophysiology*, 1975(Sep), Vol 12(5), 596-601. Studied the effect of threat of shock on the habituation of the skin conductance response (SCR) to a

series of auditory stimuli. Ss were 30 17-27 yr old students and university staff who were matched for age, sex, and Taylor Manifest Anxiety Scale score. Skin resistance and heart rate were recorded during the presentation of 20 1-sec 1,000 Hz tones in a control session and in a session at end of which Ss were led to expect a painful electric shock. The effects of the threat of shock consisted of recovery of the SCR and an increase in skin conductance level and heart rate. They were restricted to the period during which Ss believed the shock to be imminent. 2 possible reasons for the SCR recovery were offered, one in terms of M. H. Lader and A. M. Mathews's (1968) "maximal habituation" hypothesis and the other in terms of a change in the stimulus complex.—*Journal abstract.*

PHYSIOLOGICAL INTERVENTION

360. Bertolini, A. & Baraldi, M. (U Modena, Inst of Pharmacology, Italy) **Anabolic steroids: Permissive agents of ACTH-induced penile erections in rats.** *Life Sciences*, 1975(Jul), Vol 17(2), 263-266.—2 anabolic steroids (norbolethone and 4-Cl-testosterone), at a dose which is not virilizing for the peripheral target organs, restored the responsiveness of castrated male Wistar rats to the sexual stimulant effect of intraliquorally injected ACTH. It is suggested that protein synthesis is essential for male sexual drive, the nervous centers involved being even more sensitive to the anabolic activity of testosterone and related steroids than are the sex accessory organs. This suggestion is strengthened by results of an earlier study showing that cycloheximide pretreatment prevents the sexual effect of ACTH. (16 ref)—*Journal abstract.*

361. Beyer, C.; de la Torre, L.; Larsson, K. & Pérez-Palacio, G. (U Autónoma Metropolitana, Iztapalapa, Mexico) **Synergistic actions of estrogen and androgen on the sexual behavior of the castrated male rabbit.** *Hormones & Behavior*, 1975(Sep), Vol 6(3), 301-306.—In tests with 56 New Zealand white rabbits, daily injections of 2.5 mg dihydrotestosterone (DHT) for 30 days induced sexual behavior in 19% of prepuberally and 62% of postpuberally castrated Ss. Combined treatment of 2.5 mg DHT plus 5 µg of estradiol benzoate (EB) activated sexual behavior in 100% and 85% of prepuberally and postpuberally castrated Ss respectively. Moreover, Ss receiving DHT + EB displayed sexual activity in a significantly higher percentage of tests and presented a higher frequency of mounts and intromissions than Ss receiving only DHT. Results demonstrate that estrogen synergizes with androgen (DHT) to stimulate sexual behavior in the male rabbit. (18 ref)—*Journal abstract.*

362. Bresler, David E., Ellison, Gaylord & Zamenhof, Stephen. (U California, Los Angeles) **Learning deficits in rats with malnourished grandmothers.** *Developmental Psychobiology*, 1975(Jul), Vol 8(4), 315-323. Female Sprague-Dawley albino rats of 13 weeks of age were maintained on a protein-restricted or a normal diet from pregnancy and throughout pregnancy. Their female offspring (F₁) were maintained on a normal protein diet and mated with normal males. In previously reported studies the 2nd generation offspring (F₂) of malnourished grandmothers

been found at birth to have significantly lower cerebral DNA (a measure of cell number), cerebral weight, and cerebral protein than normal controls. In the present experiment, 35 of these F₂ Ss showed marked learning deficits at maturity on 2 different successive reversal tasks, even though they themselves had never directly experienced malnutrition. It is concluded that certain behavioral as well as biochemical effects of malnutrition appear in the next generation of animals. (25 ref)—*Journal abstract*.

363. Brown, R. M.; Kehr, W. & Carlsson, A. (U Göteborg, Sweden) **Functional and biochemical aspects of catecholamine metabolism in brain under hypoxia.** *Brain Research*, 1975, Vol 85(3), 491-509.—Male Sprague-Dawley rats exposed to 6% oxygen showed a partial inhibition of the rate of tyrosine hydroxylation and a blockade of the conditioned avoidance response. The behavioral disruption appears to result from a dopaminergic disturbance, since the behavior was restored by the administration of levodopa or apomorphine but not by 5-hydroxytryptophan. Biochemical data show a selective retardation in brain dopamine (DA) disappearance after synthesis inhibition. Methoxytyramine formation was markedly retarded. The decreased DA turnover was related to the release of transmitter rather than to an effect on catechol-O-methyltransferase or MAO. There was also evidence for a partial inhibition of MAO activity by hypoxia as well as a decreased activity of dopamine-beta-hydroxylase. It is concluded that the disruption of behavior was related to decreased dopaminergic receptor activation and that decreased synthesis played at most a contributory role. (44 ref)—*Journal abstract*.

364. Creese, Ian & Iversen, Susan D. (Johns Hopkins U, Medical School) **The pharmacological and anatomical substrates of the amphetamine response in the rat.** *Brain Research*, 1975, Vol 83(3), 419-436.—Bilateral 6-hydroxydopamine microinjections into the substantia nigra (SN) abolished both the locomotor and stereotypy responses to dextroamphetamine (1.5 mg/kg) in adult male Wistar rats. The lesions resulted in a depletion of over 99% of striatal tyrosine hydroxylase activity (indicating a near total lesion of the nigro-striatal dopamine pathway) as well as severe noradrenaline depletions. However, lesion of the dorsal or ventral noradrenergic pathways resulted in similar noradrenaline depletions but with no effect on striatal tyrosine hydroxylase levels and no blockage of the amphetamine response. The SN-lesioned Ss were behaviorally supersensitive to apomorphine (1 mg/kg) and levodopa (5 mg/kg) and did not show a locomotor response to cocaine (20 mg/kg). The SN-lesioned Ss were not aphagic or adipic. It is concluded that both the locomotor and stereotyped responses induced by amphetamine are dependent on the functional integrity of the nigro-striatal dopamine pathway. (45 ref) *Journal abstract*.

365. de Wied, D.; Bohus, B. & Van Wimersma Greidanus, Tj. B. (U Utrecht, Medical Faculty, Rudolf Magnus Inst for Pharmacology, Netherlands) **Memory deficit in rats with hereditary diabetes insipidus.** *Brain Research*, 1975, Vol 85(1), 152-156.—Used a 1-trial step-through passive avoidance test to study memory processes in male Brattleboro SPF rats, a strain developed with hereditary hypothalamic diabetes insipidus and lacking the ability to synthesize vasopressin. Ss were differentiated for homozygous (HMZ) and heterozygous (HTZ) diabetes insipidus. Retention latency increased with shock intensity in HTZ Ss, but not in HMZ Ss, none of which exhibited passive avoidance behavior. A single subcutaneous injection of 1 µg of arginine vasopressin or 1 µg of desglycinamide-8-lysine vasopressin, immediately following the learning trial of HMZ Ss exposed to 1.0 mA of shock, restored avoidance latency toward values indistinguishable from those of HTZ Ss exposed to a similar shock intensity. Results show that rats with an inborn error in the synthesis of vasopressin have a serious deficit in memory processes relative to HTZ rats which do exhibit avoidance learning. Findings appear to provide the first evidence of the physiological significance of vasopressin in memory processes. (15 ref)—*L. Gorsey*.

366. Delapaz, R. L.; Dickman, S. R. & Grosser, B. I. (U Utah, Medical Coll) **Effects of stress on rat brain adenosine 3',5'-monophosphate in vivo.** *Brain Research*, 1975, Vol 85(1), 171-175.—Male Sprague-Dawley rats were either physically restrained, given a 25 mV DC, 4 mA, 1-sec footshock from a floor grid every 10 sec for 1 hr, or given no shock (controls). The effects of stress and restraint on cyclic adenosine monophosphate (cAMP) levels were then assessed after a direct liquid nitrogen freezing technique. The concentrations of cAMP in the septum of both shocked and restrained Ss showed significant increases over controls of 75% and 67%, respectively. In shocked Ss, the hippocampus and brainstem showed significant cAMP increases over controls of 47% and 57%, respectively. It is suggested that the septum and hippocampus, since they are components of the limbic system, might be involved in the mediation of emotional responses during stress. (21 ref)—*L. Gorsey*.

367. Essman, Walter B.; Kimmelstiel, Fred & Sporer, Barry. (Queens Coll, City U New York) **Age-related determinants of stress-induced weight change in mice.** *Psychological Reports*, 1975(Aug), Vol 37(1), 112-114.—30 25-day-old CF-1S male mice showed a greater incidence of body weight loss and a late peak of plasma corticosterone elevation when exposed to tobacco smoke for 5 successive days, as compared with 30 mice exposed to filtered smoke (gas phase) or air. 50-day-old mice had a greater incidence and magnitude of body weight loss and a late plasma corticosterone peak after 5 days of air exposure, but not with gas phase or nicotine + gas phase. Diencephalic 5-hydroxytryptamine (serotonin), while higher among 25-day-old mice, did not differ as a function of the stress of confinement during exposure to the ventilatory stimulus or as a function of the different stimuli. Results suggest that weight loss and the time following stimulation at which plasma corticosterone is maximally elevated may serve as indices of stress and are consistent even when the stressor-susceptibility is age-related.—*Journal abstract*.

368. Godaux, E. & Desmedt, John E. (U Brussels, Brain Research Unit, Belgium) **Exteroceptive suppression and motor control of the masseter and temporalis muscles in normal man.** *Brain Research*, 1975, Vol 85(3), 447-458. In a study with 17 19-32 yr old Ss, single

electrical stimuli to the gums and mucosa inside the mouth elicited 2 successive exteroceptive suppressions (ES₁ and ES₂) in the voluntary EMG of the masseter and temporalis muscles. The same afferent axons appear to be involved in the 2 effects, as indicated by the intensity function, the electrical excitability, the afferent conduction velocity, and the lack of differential effect of Xylocaine infiltration of the inferior alveolar nerve. 2 similar phases of inhibition involved the monosynaptic masseter reflex and the synchronized EMG spikes induced by jaw vibration. Exteroceptive suppression is thought to be mediated, in the brain stem, by both an oligosynaptic (ES₁) and a multisynaptic (ES₂) mechanism. Results have implications for the functional organization of motor systems of the brain which are involved in mastication and speech. (28 ref)—*Journal abstract*.

369. Gradwell, P. B.; Everitt, B. J. & Herbert, J. (U Rhodesia, Salisbury) **5-hydroxytryptamine in the central nervous system and sexual receptivity of female rhesus monkeys.** *Brain Research*, 1975, Vol 88(2), 281-293.—Studied the role of 5-hydroxytryptamine (5-HT; serotonin) in the control of sexual receptivity in 24 adult female rhesus monkeys paired with 6 adult males. Parachlorophenylalanine (PCPA, 75 or 100 mg/kg, every 4th day), reversed unreceptivity induced by adrenalectomy in ovariectomized, estrogen-treated females. PCPA-treated females either presented more frequently and initiated more sexual behavior or refused fewer of the male's attempts to mount. These effects were reversed by 5-hydroxytryptophan (5-HTP, 20 mg/kg every 2nd day) given to PCPA-treated Ss. 5-HTP given alone to ovariectomized estrogen-treated females reduced their receptivity. PCPA lowered the levels of 5-HT in the brain as measured by the levels of 5-hydroxyindole-3-acetic acid (5-HIAA) in the cerebrospinal fluid, but these were restored by 5-HTP. Both estradiol benzoate (15 µg/day for 10 days) and testosterone propionate (250 µg/day or 400 µg/day for 10 days) lowered the turnover rates of 5-HT in the brain in ovariectomized females. The effects of estradiol on turnover were antagonized by progesterone (15 mg/day for 10 days, given with estradiol). It is suggested that androgens regulate receptivity in female monkeys by modifying the activity of 5-HT-containing neural systems. (55 ref)—*Journal abstract*.

370. Kow, Lee-Ming & Pfaff, Donald W. (Rockefeller U) **Induction of lordosis in female rats: Two modes of estrogen action and the effect of adrenalectomy.** *Hormones & Behavior*, 1975(Sep), Vol 6(3), 259-276.—In ovariectomized female rats, progesterone treatment alone does not induce lordosis, but following estrogen treatment by an appropriate interval it greatly enhances the performance of lordosis compared to that with estrogen alone. This "facilitating" effect of progesterone is thought to act synergistically with the initial "priming" effect of estrogen. In the present 3 experiments with a total of 111 Sprague-Dawley rats, a 2nd estrogen treatment given to estrogen-primed ovariectomized Ss in place of progesterone facilitated lordosis. Latency of the facilitation of lordosis following this 2nd estrogen treatment was similar to that of progesterone and was much shorter than that required for the usual priming effect, but higher doses was needed for the facilitatory

effect. Experiments with adrenalectomized-ovariectomized Ss showed that this short-latency effect of 2nd estrogen treatment need not be mediated by the adrenals. Results raise the possibility that estrogen acts on the CNS in more than 1 way to induce lordosis. (41 ref)—*Journal abstract*.

371. Liebling, David S.; Elsner, John D.; Gibbs, James & Smith, Gerard P. (New York Hosp, Westchester Div, Edward W. Bourne Behavioral Research Lab, White Plains) **Intestinal satiety in rats.** *Journal of Comparative & Physiological Psychology*, 1975(Oct), Vol 89(8), 955-965.—In 5 experiments with a total of 55 male Sprague-Dawley rats, infusion of liquid food into the duodenum inhibited sham feeding. The inhibition reflected satiety because the duodenum infusion elicited the complete behavioral sequence characteristic of satiety. The chemical and/or colligative load that the infusion imposed on the intestine appeared to be the adequate stimulus for satiety. Duodenal infusions that inhibit sham feeding and elicit satiety are not aversive, because they will not function as the UCS for the formation of a conditioned taste aversion for saccharin. The satiety elicited by the infusion of food into the duodenum is termed "intestinal satiety" by the authors. This emphasizes the belief that satiety is a reflex that can be elicited by the activation of receptors in the wall of the intestine. It is known that the activation of some intestinal receptors releases the hormone cholecystokinin (CCK). Since CCK mimics a duodenal infusion by inhibiting sham feeding and eliciting the complete behavioral sequence of satiety, it is suggested that CCK mediates intestinal satiety in the rat. (21 ref)—*Journal abstract*.

372. Luine, Victoria N.; Khylichevskaya, Rada I. & McEwen, Bruce S. (Rockefeller U, New York, NY) **Effect of gonadal hormones on enzyme activities in brain and pituitary of male and female rats.** *Brain Research*, 1975, Vol 86(2), 283-292.—Treated gonadectomized male and female Sprague-Dawley rats with equimolar doses of estradiol benzoate (EB) or testosterone propionate (TP) daily for 1 wk. The pattern of enzyme changes found in male and female brain and pituitary is discussed in relation to behavioral responses to gonadal hormones, nuclear uptake of gonadal hormones, and metabolism of androgen. Results indicate that studies of hormonal effects on brain enzyme levels provide a biochemical endpoint for defining the consequences of sexual differentiation on the functioning of the brain and pituitary. (37 ref)

373. Luine, Victoria N.; Khylichevskaya, Rada I. & McEwen, Bruce S. (Rockefeller U, New York, NY) **Effect of gonadal steroids on activities of monoamine oxidase and choline acetylase in rat brain.** *Brain Research*, 1975, Vol 86(2), 293-306.—Gonadectomized male and female Sprague-Dawley rats were treated with equimolar doses of estradiol benzoate (EB) and testosterone propionate (TP) daily for periods of 3 days to 1 wk, and activities of MAO and choline acetyltransferase (ChAc) were measured in the cortex, hippocampus, basomedial hypothalamus, corticomedial amygdala, and medial preoptic areas. After hormone treatment, changes in enzyme activities were found in those brain regions where gonadal hormones are known to affect sexual

behavior and/or gonadotropin release and which contain putative hormone receptor sites. In contrast, EB administration to castrated males had no significant effect on enzyme activities, while TP administration resulted in increased activity of MAO and ChAc in the medial-preoptic area. The estrogen antagonist, MER-25, effectively blocked EB-dependent changes in both enzymes in ovariectomized female Ss. Results are discussed in relation to sexual differentiation of the brain, metabolism of gonadal hormones, and possible mechanism of gonadal hormone regulation of enzyme activities. (53 ref)

Journal abstract.

374. Marrone, Babetta L.; Roy, Edward J. & Wade, George N. (Rutgers State U, Inst of Animal Behavior, Newark) **Progesterone stimulates running wheel activity in adrenalectomized-ovariectomized rats.** *Hormones & Behavior*, 1975(Sep), Vol 6(3), 231-236.—Daily treatment with progesterone (5 mg) increased running wheel activity, food intake, and body weight of 10 adrenalectomized-ovariectomized rats. These effects of progesterone were quite similar to those of various corticosteroid treatments in adrenalectomized rats reported previously. In addition, the activity-stimulating action of progesterone was just the opposite of its effect in intact and estradiol-primed ovariectomized rats. These observations are consistent with the hypothesis that the principle role of progesterone in the regulation of body weight is to antagonize the actions of estradiol and that the actions of excessive doses of progesterone in adrenalectomized-ovariectomized rats are simply a by-product of its cortico-steroidlike, health-promoting properties.—*Journal abstract.*

375. Nance, Dwight M.; Shryne, J. & Gorski, Roger A. (U California, Medical School, Los Angeles) **Facilitation of female sexual behavior in male rats by septal lesions: An interaction with estrogen.** *Hormones & Behavior*, 1975(Sep), Vol 6(3), 289-299.—Although destruction of the septal region markedly facilitates the lordosis behavior of female rats in response to estrogen priming, comparable lesions were found, in the present 5 experiments, to be ineffective in facilitating the lordotic behavior of estrogen primed male Sprague-Dawley age at the time of septal destruction nor castration influenced Ss lordosis behavior. However, if prepubertal castrated Ss were given subcutaneous ovarian grafts or injected daily with 2 µg estradiol benzoate (EB) during the 30-day period following septal destruction, a prolonged facilitation of the activational effects of EB on lordosis behavior was observed. Ss subjected to septal destruction alone, chronic exposure to EB alone, exposure to ovarian grafts for 30 days prior to septal destruction, or chronic treatment with EB started 6 mos after septal lesioning failed to show an increase in behavioral responsiveness to estrogen. Thus, in order for septal lesions to facilitate lordosis behavior in male rats, exposure to EB or ovarian tissue must occur within an apparent critical period following septal destruction. It is suggested that the prolonged facilitation of lordosis behavior which follows septal destruction and estrogen exposure in the male rat may be due to hormonal modifications of the recovery process following brain damage.—*Journal abstract.*

376. Phillips, Anthony G.; Bronke, Sheila M. & Fibiger, Hans C. (U British Columbia, Vancouver, Canada) **Effects of amphetamine isomers and neuroleptics on self-stimulation from the nucleus accumbens and dorsal noradrenergic bundle.** *Brain Research*, 1975, Vol 85(1), 13-22.—To examine the possible role of noradrenergic (NA) and dopaminergic (DA) systems in intracranial self-stimulation (ICS), the rate-increasing effects of dextro- and levo-amphetamine on ICS were determined in male Wistar rats with nucleus accumbens electrodes (DA placement) or dorsal NA bundle electrodes (NA placements). The dextro-isomer produced a significantly greater increase in ICS than did the levo-isomer in Ss with dorsal NA bundle electrodes. In contrast, the amphetamine isomers were equipotent in facilitating ICS in Ss with nucleus accumbens electrodes. Data suggest that there is a correlation between equipotential effects of dextro- and levo-amphetamine and DA electrode placements on the one hand, and prepotent effects of dextroamphetamine and NA electrode placements on the other. Pimozide (0.18 and 0.22 mg/kg) and haloperidol (0.02, 0.04, and 0.08 mg/kg) decreased ICS obtained from both DA and NA electrode placements. It is suggested that neuroleptic drugs may produce a general disruption of operant behavior and that the decrease in ICS produced by these agents does not therefore necessarily implicate dopaminergic mechanisms in the neurochemistry of reward. (40 ref)—*Journal abstract.*

377. Siegel, H. I. & Rosenblatt, J. S. (Kansas U Medical Ctr, Kansas City) **Progesterone inhibition of estrogen-induced maternal behavior in hysterectomized-ovariectomized virgin rats.** *Hormones & Behavior*, 1975(Sep), Vol 6(3), 223-230.—64 hysterectomized-ovariectomized virgin Sprague-Dawley rats were tested for maternal behavior following treatment with 100 µg/kg estradiol benzoate (EB) immediately at surgery, and either oil or 0.5 or 5.0 mg progesterone either 0, 24, or 44 hrs following surgery. Stimulus pups were presented 48 hrs postoperatively, which is counted as Day 0 of testing. EB + oil Ss displayed short-latency maternal behavior beginning on Day 0. The injection of 5.0 mg progesterone at 0, 24, and 44 hrs significantly inhibited the onset of maternal care, while the effect of the lower dose of progesterone depended upon the timing of its administration in relation to that of EB. At a dose of 0.5 mg, progesterone given 24 hrs following EB inhibited the appearance of maternal behavior but had no effect given at 44 hrs and resulted in only a partial delay when given at the same time as the EB. Possible mechanisms by which progesterone interfered with the display of maternal behavior are discussed. (33 ref)—*Journal abstract.*

378. Simpson, C. Wayne et al. (Purdue U) **Stress-induced ulceration in adrenalectomized and normal rats.** *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 189-191.—Examined the influence of plasma corticosterone on stress-induced ulceration in restrained rats. Ss were 30 adult male Sprague-Dawley rats. Gastric pathology and plasma corticosterone levels were examined in normal (UNOP) and adrenalectomized (ADX) Ss under 2 conditions of shock predictability. The severity of the gastric ulceration in unoperated Ss given noncon-

tingent presentations of a tone and an electric shock was greater than in Ss receiving shocks contingent upon CS presentation. When ulcer pathology was evaluated for ADX Ss, no differences were found between the predictable and the unpredictable shock groups. Results are discussed in terms of the necessary and sufficient conditions for stomach ulcer formation as a function of shock predictability and restraint stress and the necessity to investigate alternative hypotheses. (15 ref)—*Journal abstract*.

379. Thor, Donald H. & Ghiselli, William B. (E. R. Johnstone Training & Research Ctr, Bordentown, NJ) **Mouse-killing by devibrissae and facially anesthetized rats.** *Psychological Reports*, 1975(Aug), Vol 37(1), 15-20. —18 mouse-killing Long-Evans male rats were devibrissae and facially anesthetized to determine relative importance of facial tactual sensation in detection, pursuit, and killing behavior. With vibrissae clipped plus local anesthesia of the vibrissal pads, all Ss attacked and killed mice with efficiency comparable to pretest baseline measures. Results indicate a nonsignificant role of vibrissal sensation in maintenance of the rat's predatory kill response. Although initial killing may be contingent upon multiple sensory cues, established killing is independent of intact perception of the target. (18 ref)—*Journal abstract*.

380. Tursky, Barbara. (State U New York, Stony Brook) **Factors that can affect the use of electric shock in behavior therapy.** *Behavioral Engineering*, 1975(Spr), Vol 2(3), 61-67.—Reviews comprehensive research in the use of electric shock as a pain stimulus in the psychophysiology laboratory. The development of a standard stimulation technique is described. Studies involving the use of this procedure to investigate psychological, physiological, and clinical factors that affect the evaluation of pain are discussed. Cultural and behavioral influences on pain tolerance are investigated and physiological response measures tested. Possible clinical applications are noted, and special consideration is given to the psychophysical evaluation of the sensory and connotative components of the pain experience. (22 ref)—*Journal abstract*.

381. Yaksh, Tony L. & Yamamura, Henry I. (U Wisconsin, School of Pharmacy, Madison) **Blockade by morphine of acetylcholine release from the caudate nucleus in the mid-pontine pretrigeminal cat.** *Brain Research*, 1975, Vol 83(3), 520-524. Reports that a previously found ongoing release of [³H] acetylcholine from the striatum is not only reduced in a dose-dependent fashion following morphine administration, but also that morphine blocks the increased release normally evoked after electrical stimulation of the caudate nucleus. It is suggested that morphine acts directly on synapses in the caudate nucleus to alter the release of acetylcholine. (29 ref)

Electrical Stimulation

382. Chatrian, Gian E.; Canfield, Robert C.; Knauss, Thomas A. & Lettich, Ettore. (University Hosp, Div of Electroencephalography & Clinical Neurophysiology, Seattle, WA) **Cerebral responses of electrical tooth pulp stimulation in man: An objective correlate of acute experimental pain.** *Neurology*, 1975(Aug), Vol 25(8),

745-757.—Electrically stimulated the pulp of individual teeth of 17 normal adult volunteers via pairs of electrodes implanted into dentine. Computer-summed responses recorded from the surface of the head were composed to 2 concurrent sequences of events, one of which was seen maximally over midline areas and the other over the lower portions of the postcentral regions. Appropriate tests demonstrated that these wave forms represented cerebral tooth pulp-evoked potentials. Because tooth pulp-evoked potentials represent objective, quantifiable, nonverbal concomitants of central events associated with the perception of noxious stimuli, they may prove helpful in investigating acute experimental pain in man. (78 ref)—*Journal abstract*.

383. Douglas, Robert M. & Goddard, Graham V. (Dalhousie U, Halifax, Canada) **Long-term potentiation of the perforant path-granule cell synapse in the rat hippocampus.** *Brain Research*, 1975, Vol 86(2), 205-215. —Notes that when the entorhinal cortex is electrically stimulated, a monosynaptic evoked potential is produced in the ipsilateral hippocampus. In a study with 18 male hooded Charles River rats, 24 hrs after a 120-pulse stimulation train, the response to a single test pulse was increased. Stimulation trains presented at a rate of 1/day had a cumulative effect on both the population excitatory postsynaptic potential (EPSP) and spike components of the evoked potential, and the potentiation lasted at least 12 days. In a few cases, retested 2 mo after the last stimulation train, the population EPSP was still highly potentiated, while the population spike had declined to initial levels. The most reliable results and largest potentiation were obtained with diphasic stimulation trains of 10 Hz or greater. Data show that short durations of physiologically feasible stimulation frequencies can produce large increases in the output of the granule cells to a constant input and suggest that this type of potentiation may underlie memory storage in 1 part of the mammalian brain. (24 ref)—*Journal abstract*.

384. Drickamer, Lee C. (Williams Coll) **Contact stimulation and accelerated sexual maturation of female mice.** *Behavioral Biology*, 1975(Sep), Vol 15(1), 113-115.—Clarifies 2 issues raised in a previous paper by the author (see PA, Vol 53:2792). Data are presented which suggest that adult male and adult neonatally androgenized female mice caged continuously with prepubertal females both provide the young females with male-like contact stimulation. The data in the earlier paper are not sufficient to draw conclusions regarding any connections between earlier sexual maturation in young female mice and the male-like contact stimulation. The data of the earlier experiments and the experiment presented in this note do support the conclusion that the accelerated sexual development of young female mice in the presence of an adult male involves more than just a male urinary pheromone.—*Journal abstract*.

385. Gold, Paul E. et al. (U California, School of Biological Sciences, Irvine) **Memory interference and facilitation with posttrial amygdala stimulation: Effect on memory varies with footshock level.** *Brain Research*, 1975, Vol 86(3), 509-513.—Examined the effect of amygdala stimulation on avoidance training with varying levels of footshock (a 0.5 mA 5-sec shock or a 2 mA 2-sec

shock), using male Sprague-Dawley rats. Approximately 1-2 wks after the operation, Ss were trained in a 1-trial inhibitory avoidance task in which the footshocks were delivered. 8 experimental Ss then received amygdala stimulation for 10 sec; unstimulated implanted and unimplanted Ss were also included, as was a group of 5 Ss which received no footshock but were given amygdala stimulation. Results of retention tests administered 24 hrs after training indicate that, relative to the performance of the implanted control groups, posttrial amygdala stimulation interfered with retention of training with high footshock but enhanced retention with low footshock. It is suggested that the effects on memory produced by posttrial brain stimulation are the result of a modulation of memory processes, rather than the result of direct stimulation of a neural system involved in memory storage processing, and that the behavioral effects of electrical stimulation of the brain vary with the internal state of the S at the time of stimulation. (20 ref)—*L. Gorsey.*

386. Gold, Paul E.; Edwards, Rose M. & McGaugh, James L. (U California, School of Biological Sciences, Irvine) **Amnesia produced by unilateral, subseizure, electrical stimulation of the amygdala in rats.** *Behavioral Biology*, 1975(Sep), Vol 15(1), 95-105.—Trained male Sprague-Dawley rats on a 1-trial inhibitory (passive) avoidance task. 5 sec after the offset of the training footshock, Ss received unilateral, subseizure electrical stimulation of the amygdala. When compared to either implanted or unimplanted control Ss, those Ss which received posttrial amygdala stimulation had a significant retention deficit. Histological examination of electrode placements indicated that maximal interference with retention was produced by stimulation of a small region of the amygdala in or near the basomedial nucleus. Increases in the stimulation train duration from 10 to 30 sec increased the degree of the retention deficit produced by th stimulation. (15 ref)—*Journal abstract.*

387. Pinel, John P.; Mucha, R. F. & Phillips, A. G. (U British Columbia, Vancouver, Canada) **Spontaneous seizures generated in rats by kindling: A preliminary report.** *Physiological Psychology*, 1975(Jun), Vol 3(2), 127-129. Studied the gradual development of epileptogenicity in animals receiving low-intensity CNS electrical stimulation. Daily amygdaloid stimulation was administered to 18 male hooded rats at current levels initially too low to produce a motor response but high enough to produce an electrographic afterdischarge. This resulted in the progressive development and intensification of stimulus-induced epileptic activity (kindling). In contrast to previous studies, however, stimulation was continued long after the point where the exacerbation of motor seizures seemed complete. Several Ss were stimulated for up to 7 mo and, with continued stimulation, an epileptic syndrome characterized by spontaneous motor seizures was observed to develop.—*Journal abstract.*

388. Zimmerberg, Betty & Glick, Stanley D. (Mt Sinai School of Medicine, City U New York) **Changes in side preference during unilateral electrical stimulation of the caudate nucleus in rats.** *Brain Research*, 1975, Vol 86(2), 335-338. Examined the effects of unilateral electrical stimulation of the caudate nucleus on side preferences in 7 female albino Sprague-Dawley rats to

test the hypothesis that rotation and side preference are both subserved by the nigrostriatal system and reflect, in different magnitudes, the intrinsic asymmetry of the system. Ss were trained to barpress for water reinforcement on a continuous reinforcement schedule for 4 wks in daily 30-min sessions until all Ss exhibited consistent side preferences for 1 of 2 levers. Bipolar electrodes in the caudate nucleus were then implanted and, after a 1-wk recovery period, Ss were tested for rotation with unilateral stimulation of either electrode. Stimulation on the same side as the side preference caused a reversal of side preference to the opposite lever, and stimulation on the side opposite to the preferred lever had no effect on side preference. It is suggested that reversal of side preference after unilateral stimulation of the caudate nucleus is a form of sensory "overattention" to the opposite side and that a side preference exhibited spontaneously may result from a normal imbalance between the left and right nigrostriatal systems, with the greater activity in one system producing greater attention to the opposite side. (18 ref)—*L. Gorsey.*

Lesions

389. Ángyán, L. (Medical U, Inst of Physiology, Pécs, Hungary) **Vagal influences on hypothalamic self-stimulation in the cat.** *Life Sciences*, 1975(Jul), Vol 17(2), 289-292.—Recorded the electrical activity of the vagus nerve during hypothalamic self-stimulation in 3 implanted cats. The vagal activity was suppressed by the onset of rewarding stimulation but reappeared and gradually increased during the consecutive leverpressings. After several stimulus trains, a rebound-like facilitation of the vagal activity appeared regularly with a pause in the leverpressings. Electrical stimulation of the vagus nerve suppressed self-stimulation. The leverpressing rate increased after bilateral vagotomy. Results support the idea that a peripheral feedback mechanism affects self-stimulation via the vagus nerve.—*Journal abstract.*

390. Best, Jay B.; Abelein, Michal; Kreutzer, Erik & Pigon, Andrew. (Colorado State U) **Cephalic mechanism for social control of fissioning in planarians: III. Central nervous system centers of facilitation and inhibition.** *Journal of Comparative & Physiological Psychology*, 1975(Oct), Vol 89(8), 923-932.—Previous studies have indicated that asexual reproduction (fissioning) in the planarian *Dugesia dorotocephala* is socially controlled through a cephalic mechanism: Isolation releases fissioning; grouping inhibits it; decapitation, at the level of the auricles, releases it even in grouped Ss. The brain is not necessary for programing the actual events of fissioning; these are orchestrated by the segmental plexus fissioning (SPF) system. In the present 3 experiments, with 810 experimental and 516 "filler" Ss, various surgical cuts were made to ablate selected portions of the CNS of isolated and grouped Ss in order to ascertain the inhibitory or facilitatory effects of these in the physiological mediation of such control on the SPF system. Results are synthesized into a model of this control system; the anterior lobes and optic regions of the brain inhibit the SPF system, and the anterior and caudal segmental plexuses facilitate it. These influences are partially tonic and partially contingent upon social stimulations. (17 ref)—*Journal abstract.*

391. Dabrowska, Jadwiga & Drzewiecka, Barbara. (Nencki Inst of Experimental Biology, Warsaw, Poland) **Comparison of the septal lesion effects on visual and spatial discriminations in rats.** *Acta Neurobiologiae Experimentalis*, 1975, Vol 35(3), 255-274.—Investigated postoperative performance in acquisition and reversal learning of 36 adult male hooded septal rats and compared them with 30 control rats in 3 experiments. Exp I involved a simultaneous black-white discrimination task. The number of errors in normal and septal Ss was similar in acquisition and reversal learning. Both septal and normal Ss manifested directional response sets. Exp II examined a position habit discrimination. Acquisition was similar in septal and normal Ss, while investigated a position habit discrimination with available irrelevant visual stimuli, indicated that both acquisition and reversal learning were impaired in operated Ss. Results suggest that septal Ss utilized response produced cues to control their behavior, but the enhanced orienting response to the visual stimuli interfered with the proprioceptive stimuli. (26 ref)—*Journal abstract*.
392. Donovan Peter J.; Burright, Richard G.; Fuller, John L. & Branson, Perry R. (State U New York, Binghamton) **Septal lesions and behavior: Effects of presurgical rearing and strain of mouse.** *Journal of Comparative & Physiological Psychology*, 1975(Oct), Vol 89(8), 859-867.—In 2 experiments a total of 64 black C57BL/10J and 64 albino SJL/J male mice were reared in either enriched social cages or restricted individual cages from 25 days of age until they underwent septal or control surgery 1 mo later. Enrichment differentially altered septal or control behavior as measured by fluid consumption of water, saccharin, and quinine; performance on a rotorod; and the acquisition of an active avoidance task. The interactions of presurgical history with brain damage were manifested differently in the 2 strains of mice. The importance of attending more to genetic and presurgical history in attempts to define the effects of brain damage on behavior and to determine the function of brain structures is discussed. (25 ref)—*Journal abstract*.
393. Goodale, Melvyn A. & Murison, Robert C. (U St Andrews, Psychological Lab, Scotland) **The effects of lesions of the superior colliculus on locomotor orientation and the orienting reflex in the rat.** *Brain Research*, 1975, Vol 88(2), 243-261.—Conducted 2 experiments with a total of 9 male hooded rats to study the effects of bilateral removal of the superior colliculus or visual cortex on visually guided locomotor movements in Ss performing a brightness discrimination task. Data were recorded on 16-mm film. Ss with collicular lesions showed patterns of locomotion comparable to or more efficient than those of normal Ss when approaching 1 of 5 small doors located at 1 end of a large open area. In contrast, Ss with large but incomplete lesions of visual cortex were distinctly impaired in their visual control of approach responses to the same stimuli. Ss with collicular damage showed no orienting reflex or evidence of distraction in the same task when novel visual or auditory stimuli were presented. However, both normal and visual-decorticate Ss showed various components of the orienting reflex and disturbance in task performance when the same novel stimuli were presented. Results suggest that the superior colliculus participates in the mediation of shifts in visual fixation and attention. (42 ref)—*Journal abstract*.
394. Harris, Valerie S. & Sachs, Benjamin D. (U Connecticut) **Copulatory behavior in male rats following amygdaloid lesions.** *Brain Research*, 1975, Vol 86(3), 514-518.—Examined the possible role of the corticomedial (CM) and basolateral (BL) regions of the amygdala in mediating male sexual behavior. Ss were adult male Long-Evans rats which were assigned to either CM lesion ($n = 12$), BL lesion ($n = 6$), or sham-operated control ($n = 11$) groups. 2-3 biweekly tests were given 2 wks after surgery. On the 1st postoperative test, Ss with BL lesions and most of the sham Ss copulated normally. The CM Ss had severe deficits in copulatory behavior, characterized by a reduced ability to achieve ejaculation. Most CM Ss required female changes and tail pinches before they would initiate and maintain copulatory activity and their pacing of copulation was slow. By the 2nd test, the CM Ss showed some recovery of ejaculatory potential. CM Ss had significantly more intromissions to ejaculation in all 3 tests than either of the other groups. A comparison of the present lesions to those in previous studies suggests that the medial nucleus of the amygdala may be a primary factor in producing impairment of ejaculatory potential and increases in intromissions. The stimulatory effect of female changes and tail pinches on copulation in the CM Ss suggest that a deficit in arousability may also be involved. (21 ref)—*L. Gorsey*.
395. Hart, Benjamin L. & Jones, T. O. (U California, School of Veterinary Medicine) **Effects of castration on sexual behavior of tropical male goats.** *Hormones & Behavior*, 1975(Sep), Vol 6(3), 247-258. This study was undertaken because comparative information regarding the role of gonadal androgen in sexual behavior of adult male mammals is notably deficient in data from ungulate species. After a series of preoperative tests, 8 Red Sokoto male goats were castrated and tested for sexual behavior with receptive females at 1-2 week intervals for 52 postoperative wks. Only 1 S was judged to have lost the ejaculatory response; this was after 18 weeks of postoperative testing. Compared with observations on other species, an unusually high percentage of these Ss showed a long-term retention of sexual activity after castration. Even with this long-term retention, however, there was a significant decrement in frequency of ejaculatory responses within 1 wk after castration. The flehman response, which some believe to be related to detection of excreted urinary pheromones, also declined in frequency after castration. (23 ref)—*Journal abstract*.
396. Hull, Elaine M. & Homan, Harvey D. (State U New York, Buffalo) **Olfactory bulbectomy, peripheral anosmia, and mouse killing and eating by rats.** *Behavioral Biology*, 1975(Aug), Vol 14(4), 481-488.—17 male Sprague-Dawley rats which had not killed a mouse in 6 wks sustained bilateral olfactory bulbectomies. 15 of these started to kill after surgery, and 9 consistently killed on the same day the mouse was introduced. 12 nonkillers sustained surgical ablation of the olfactory receptors. None of these killed after surgery. Of 8 spontaneous killers which consistently killed on the day a mouse was introduced, 4 sustained receptor ablations and 3, bulbectomies. One remained an unoperated

control. All killed as quickly and as consistently as before. Most bulbectomized Ss employed an "emotional," messy style of killing, and bulbectomy-facilitated killers ate less of their prey than did spontaneous killers. Deafferentation had no effect on killing or eating. This is interpreted as evidence for irritable aggression on the part of bulbectomized rats, and for a nonolfactory role of the olfactory bulbs. (15 ref)—*Journal abstract*.

397. Igarashi, M.; Alford, B. R.; Kato, Y. & Levy, J. K. (Baylor Coll of Medicine, Houston, TX) **Effect of physical exercise upon nystagmus and locomotor dysequilibrium after labyrinthectomy in experimental primates.** *Acta Oto-Laryngologica*, 1975(Mar-Apr), Vol 79(3-4), 214-220.—Spontaneous nystagmus and locomotor equilibrium function were repeatedly tested before and after unilateral labyrinthectomy in 12 squirrel monkeys to study the effect of physical exercise on the vestibulo-oculomotor and vestibulo-locomotor compensation. Postoperatively, 6 Ss received forced physical exercise in the rotating cage, while the other 6 did not. The provocation of postoperative spontaneous nystagmus was less in the exercise group. Data show a certain contribution of physical exercise toward the oculomotor balance compensation and maintenance, probably at the level of the brain stem. Statistical comparison of the locomotor equilibrium performance did not depict a significant difference between the exercise and nonexercise groups; however, there was a possibility that the present testing maneuver, which involved physically advanced tasks, might have concealed the effect of the physical exercise. (French & German summaries)—*Journal abstract*.

398. Kirvel, R. D. (Ohio State U, Research Ctr, Lab of Comparative & Physiological Psychology) **Sensorimotor responsiveness in rats with unilateral superior collicular and amygdaloid lesions.** *Journal of Comparative & Physiological Psychology*, 1975(Oct), Vol 89(8), 882-891.—In an experiment with 80 male Long-Evans rats, large unilateral lesions of superior colliculus but not amygdala, resulted in strong ipsiversive progression tendencies and permanent neglects of visual, auditory, and whisker-touch stimuli presented on the contralateral side of the body. Combined collicular-amygdaloid lesions also yielded circling behaviors and multimodal neglects that were completely independent of the order or laterality of the amygdaloid lesion. Ss with colliclectomy either neglected or turned away from pinches of the contralateral ear and forepaw. Ss with combined lesions displayed more crossed orientations, and this tendency was greatly potentiated by ipsilateral lesion placement. The nature and time course of the crossed response in rats with sensory neglects is reminiscent of the clinical syndrome described as allosthesia or as contralateral sensory displacement. (23 ref)—*Journal abstract*.

399. Marks, H. E. (U South Carolina, Lancaster) **Changes in operant responding for saccharin in male and female hamsters following gonadectomy.** *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 192-194.—10 male and 10 female Syrian Golden hamsters were trained to barpress for saccharin. Half of each group was gonadectomized and tested for response rate for saccharin reinforcement under water deprived and nondeprived conditions. Gonadectomized females did not differ from

intact females in response rate or weight gain. Gonadectomized males gained more weight and barpressed less than intact males. Data are discussed as failing to support any current theory dealing with the effects of alterations in gonadal hormones on preference behavior.—*Journal abstract*.

400. Marshall, John F. (U Pittsburgh, Psychobiology Program) **Increased orientation to sensory stimuli following medial hypothalamic damage in rats.** *Brain Research*, 1975, Vol 86(3), 373-387.—In a study with male and female albino Charles River rats, unilateral medial hypothalamic damage caused Ss to become hyperresponsive to touch, odors, and visual stimuli presented on the side contralateral to the damage, while responses to ipsilateral stimuli remained near preoperative levels. Ss oriented their snouts more precisely to stimuli presented on the contralateral side, turned toward touch of more caudal points along that body surface, and pursued moving stimuli more vigorously on that side. Ss with unilateral damage viciously bit relatively weak noxious stimuli presented on the contralateral side. After injections of amphetamine, Ss turned away from the side of the damage. After bilateral damage, Ss showed increased responsiveness to sensory stimuli arising on either side. Ss with unilateral damage ate more food from a container located in the contralateral sensory field than they had preoperatively and attacked mice more frequently and with shorter latencies when the mouse was on the side contralateral to the lesion. It is suggested that increased responsiveness to sensory stimuli plays a role in the syndrome of hyperphagia, finickiness, and increased aggressiveness seen after medial hypothalamic damage. (47 ref)—*Journal abstract*.

401. Miller, Claude R. et al. (Georgia Coll) **Taste aversion and passive avoidance in rats with hippocampal lesions.** *Physiological Psychology*, 1975(Jun), Vol 3(2), 123-126.—Re-examined the effects of hippocampal lesions on conditioned taste aversion (using a very intense UCS) and on passive avoidance. 12 male albino rats with near-total hippocampal lesions were compared with 10 cortical- and 10 normal-control animals on taste aversion and passive avoidance conditioning. While the initial magnitude of the taste aversion induced through illness was not significantly affected by hippocampal ablation, the aversion did extinguish more rapidly in experimental Ss. Locomotor passive avoidance was significantly impaired by the lesion. (16 ref)—*Journal abstract*.

402. Molino, Andy. (Brockville Psychiatric Hosp, Canada) **Sparing of function after infant lesions of selected limbic structures in the rat.** *Journal of Comparative & Physiological Psychology*, 1975(Oct), Vol 89(8), 868-881.—The effects, in adult Ss, of limbic lesions produced in infancy were studied in 273 male Wistar rats using weight gain and conditioned emotional response (CER) and conditioned avoidance response (CAR) acquisition as the critical measures. Ss received bilateral lesions of the amygdala, septum, postventral hippocampus (PH) anterodorsal hippocampus (AH), or frontal cortex either as infants (at 10 days of age) or as adults (at 60 days). Normal and anesthetized control groups were also used. Frontal cortical lesions, AH

lesions, and anesthetization had no effect on weights or on CER and CAR acquisition. Both infant and adult amygdala and septal lesions significantly disrupted normal weight gain. Adult-acquired amygdala and PH lesions significantly retarded CER acquisition, and adult septal and PH lesions significantly facilitated CAR acquisition. Infant-acquired amygdala lesions significantly facilitated CAR acquisition, and infant PH lesions had no effect on either task. Results are interpreted to mean that the observed task-specific recovery in early-operated Ss may have been due to some form of functional reorganization. (30 ref)—*Journal abstract*.

403. O'Keefe, John; Nadel, Lynn; Keightley, Simon & Kill, David. (University Coll, London, England) **Fornix lesions selectively abolish place learning in the rat.** *Experimental Neurology*, 1975(Jul), Vol 48(1), 152-166. —16 male hooded rats with lesions in the fornix, a major afferent-efferent pathway of the hippocampus, failed on a water-finding task when place learning was required but succeeded in the same task when cue learning was required. These data, in conjunction with earlier physiological findings, indicate that the hippocampus functions as a cognitive mapping system. (18 ref)—*Journal abstract*.

404. Srebro, Bolek & Lorens, Stanley A. (U Bergen, Inst of Physiology, Norway) **Behavioral effects of selective midbrain raphe lesions in the rat.** *Brain Research*, 1975, Vol 89(2), 303-325. —In a study with 40 male Moll-Wistar rats, lesions were produced in the median ($n = 8$), dorsal ($n = 7$), or both ($n = 7$) midbrain raphe nuclei and their effects on behavior (Days 16-54 postoperatively) compared to that of controls ($n = 9$); forebrain 5-hydroxytryptamine (5-HT) concentrations were also determined. Only the median and combined lesion groups showed increased running wheel and open field activity, as well as enhanced reactivity to novel stimuli and environmental change. None of the lesion groups, however, showed changes in home cage activity on postoperative Day 21. Although all lesion groups were deficient in the acquisition and retention of 1-way avoidance, the deficits were of a greater magnitude in the median and combined lesion groups. The latter 2 groups were impaired in forced extinction of the 1-way avoidance response, but only the combined lesion group evidenced facilitation of 2-way avoidance acquisition. Results suggest that the dorsal raphe nucleus plays a different behavioral role than the median raphe nucleus. The median, dorsal, and combined raphe lesions lowered forebrain 5-HT by 26, 65, and 77%, respectively, versus controls, indicating, with previously reported data, that the dorsal raphe nucleus is the principal origin of forebrain 5-HT. It is suggested that the behavioral effects of midbrain raphe lesions were not due primarily to their associated reductions in forebrain 5-HT. (61 ref) —*Journal abstract*.

405. Stein, Barry E. & Magalhaes-Castro, Brailio. (U California, Medical School, Los Angeles) **Effects of neonatal cortical lesions upon the cat superior colliculus.** *Brain Research*, 1975, Vol 83(3), 480-485. —Performed subtotal visual cortex lesions in 14 anesthetized kittens aged 2.5 days, 2-3 wks, and 5 wks, and studied response properties of superior colliculus neurons following a 2-4 mo recovery period. Results indicate that some

movement selectivity does develop in the absence of corticotectal afferents, but that the selectivity closely resembles that observed in adult decorticate animals and that the presence of the visual cortex is as critical during development as in maturity for maintaining the functional integrity of the superior colliculus. (31 ref)

406. Weiskrantz, Lawrence & Passingham, Clare. (U Oxford, England) **Equivalent stimuli for stripes in rats with striate cortex ablations.** *Brain Research*, 1975, Vol 86(3), 389-397. —Determined which features of a visual discrimination task were used by 9 male hooded rats with total striate cortex ablations. 10 unoperated controls were also used. The task was vertical black and white stripes vs grey matched in flux. Probe trials were inserted in which stripes of 2 different orientation or a speckled pattern were substituted for either the positive or negative stimulus. The destriated Ss were normal in response to stripes of different orientations but showed a deficit with speckled pattern. Other data indicate an increased preference for the speckled pattern by the destriated group. —*Journal abstract*.

407. Weller, W. Lee & Johnson, John I. (U Tasmania, Hobart, Australia) **Barrels in cerebral cortex altered by receptor disruption in newborn, but not in five-day-old mice (Cricetidae and Muridae).** *Brain Research*, 1975, Vol 83(3), 504-508. —Lesioned large mystacial vibrissa follicles in 5 specimens of *Mus musculus* and 4 of *Peromyscus leucopus* on the 1st postnatal day and in 4 *Mus* and 2 *Peromyscus* on the 5th postnatal day. Results demonstrate the importance of an intact periphery for normal development of central neural organization and show that small peripheral lesions, if performed early enough, can alter the normal organization or arrangement of groups of cortical neurons. (19 ref)

408. Zeigler, H. Philip. (American Museum of Natural History, New York, NY) **Trigeminal deafferentation and hunger in the pigeon (*Columba livia*).** *Journal of Comparative & Physiological Psychology*, 1975(Oct), Vol 89(8), 827-844. —In 2 experiments with a total of 48 White Carneaux and Silver King pigeons, the location and distribution of the pigeon's trigeminal nerve permitted afferentation of the oral region without affecting motor functions. Although trigeminal deafferentation did not affect drinking, it reduced the efficiency of the consummatory response of eating and disrupted motivational processes underlying hunger and weight regulation. Although the 2 types of deficit may be experimentally dissociated, trigeminal deafferentation invariably affected both sensorimotor and motivational mechanisms. The deficits in food intake and weight regulation seen after trigeminal deafferentation in the pigeon resembled some components of the "lateral hypothalamic syndrome" in the rat. Results are related to recent studies of the contribution of peripheral and central oropharyngeal factors to the neural control of food intake in both rat and pigeon. (38 ref)—*Journal abstract*.

409. Zeigler, H. Philip; Miller, Maria & Levine, Richard R. (American Museum of Natural History, New York, NY) **Trigeminal nerve and eating in the pigeon (*Columba livia*): Neurosensory control of the consummatory responses.** *Journal of Comparative & Physiological Psychology*, 1975(Oct), Vol 89(8), 845-858. —Conducted 3 experiments in which electrophysiological

neurobehavioral, and cinematographic techniques were used to study the role of the trigeminal nerve in the neurosensory control of eating in a total of 30 Silver King and White Carneaux pigeons. Analysis of single-unit data recorded in the trigeminal ganglion indicated that the trigeminal nerve provides somatosensory inputs from the oral region that signal the location and movement of food and monitor the extent of mouth opening. Trigeminal deafferentation, although it did not affect pecking or swallowing, severely impaired the efficiency of eating. Cinematographic analysis showed that the impairment due to disruption of the neurosensory control of mandibulation—the process by which grain is grasped at the beak tip and moved to the back of the mouth (22 ref)—*Journal abstract*.

Drug Stimulation & Psychopharmacology

410. Allen, R. Wade; Jex, Henry R.; McRuer, Duane T. & DiMarco, Richard J. (Systems Technology, Inc., Hawthorne, CA) **Alcohol effects on driving behavior and performance in a car simulator.** *IEEE Transactions on Systems, Man, & Cybernetics*, 1975(Sep), Vol 5(5), 498-505.—Designed and tested a simulation which includes lateral steering control and a discrete visual detection, recognition, and response task to provide the workload and division of attention typical of real world driving. Measurements of driver control behavior and driver-vehicle performance were obtained for the steering task, and detection and recognition indexes and reaction time were measured on the discrete task. Preliminary results on scanning behavior as measured with an eye-point-of-regard monitor are also presented. Data are given for 18 21-65 yr old drivers at blood alcohol concentrations of 0, 0.06, and 0.11. Alcohol caused larger lane and heading deviations and increased detection and reaction times on the discrete task. Control-behavior measures show that the driver's control gain decreased, but stability margins were maintained under alcohol, while driver remnant increased. The simulation has proven an efficient tool for alcohol research. It has gained acceptance from Ss as a valid approximation of driving, and the various related measurements have proven to be reliable and sensitive to levels of intoxication. (27 ref)—*Journal abstract*.

411. Babbini, M.; Gaiardi, M. & Bartoletti, M. (U Bologna, Inst of Pharmacology, Italy) **Persistence of chronic morphine effects upon activity in rats 8 months after ceasing the treatment.** *Neuropharmacology*, 1975(Aug), Vol 14(8), 611-614.—12 male Sprague-Dawley rats were treated daily with 20 mg/kg of ip morphine HCl for 59 days, and motility was registered for 7 hrs after treatment, using juggle-cage actometers. Ss were then tested for the persistence of chronic morphine effect on activity and were given the same dose of the drug on Days 20, 40, 80, 160, and 240 after ceasing the treatment. The initial depression of motility rapidly underwent tolerance and then was gradually changed into excitation. This excitation disappeared when Ss were tested 20 days after their last previous injection, but the depressive phase was not resumed.—*Journal abstract*.

412. Byrd, Larry D. (Harvard U. Medical School, Southborough) **Effects of Δ -amphetamine on schedule-controlled key pressing and drinking in the chimpanzee.**

Journal of Pharmacology & Experimental Therapeutics, 1973, Vol 185(3), 633-641.—Maintained keypressing in the chimpanzee under a multiple schedule comprising a 10-min FI schedule and a 100-response FR schedule of food delivery. Water intake during the 2-hr session totaled 1.5-2.0 liters in 1 S and was greatest during the 10-min FI schedule. Effects of amphetamine on keypressing and drinking during the session, and on drinking in the living area following the session, were related. Mean rates of keypressing under the FI schedule were enhanced by 0.3-1.0 mg/kg, and mean rates under the FR schedule were enhanced by 0.03-0.3 mg/kg. Effects of amphetamine on keypressing during successive quarters of the FI schedule were a function of control rates of responding. Drinking during the session and drinking in the living area during the 1st 12 hrs following the session were decreased by doses that had either little effect or an enhancing effect on keypressing. Drinking was nearly completely eliminated by 1.0-3.0 mg/kg of amphetamine. At none of the doses did amphetamine enhance drinking.—*Journal abstract*.

413. Campo, R. A. (Central U Venezuela, Pharmacy School, Caracas) **Development of tolerance in pigeons to behavioral effects of a new benzopyran derivative.** *Journal of Pharmacology & Experimental Therapeutics*, 1973, Vol 184(3), 521.—Trained pigeons under a multiple FR-FI schedule of food presentation until their performance in daily sessions was consistent. Effects of a new nitrogen-containing benzopyran derivative, SP-1, on performance was then studied. Doses of SP-1 up to 0.3 mg/kg had little effect on rates of responding; higher doses reduced responding, until a dose of 3.0 mg/kg abolished responding in both components of the schedule and produced ataxia. When the 3.0 mg/kg dose of SP-1 was injected daily, responding was suppressed during each of the 1st 3 days, but on succeeding days responding progressively recovered. The daily dosage was then increased to 10.0 mg/kg, then to 17.0 mg/kg, and finally 30.0 mg/kg of SP-1. After the 1st few days the mean rate of responding was always above 50% of control rate, and responding after the last injection of 30.0 mg/kg, ending 17 daily drug injections, was essentially normal. After a period of 30 days without drug, 30 mg/kg of SP-1 still did not suppress responding, showing the persistence of a strong tolerance to the suppressive behavioral effects of the drug. After a period of 100 days without drug, however, a single injection of 30.0 mg/kg again suppressed responding and caused ataxia.—*Journal abstract*.

414. Cappell, Howard; Webster, C. D.; Herring, Barbara S. & Ginsberg, Ronald. (Addiction Research Foundation, Toronto, Canada) **Alcohol and marihuana: A comparison of effects on a temporally controlled operant in humans.** *Journal of Pharmacology & Experimental Therapeutics*, 1972, Vol 182(2), 195.—Compared the effects of marihuana and ethanol on performance of a behavioral task in which Ss were required to space keypress responses at least 20 sec apart in order to receive a small monetary reinforcement. Reinforcement was available for a limited period ranging from 0.5 to 4.0 sec. Ss received immediate feedback indicating whether a response was premature, correct, or late. In a Latin square design, 12 Ss performed after consuming mari-

huana cigarettes containing a total of 0, 4, 8, or 16 mg of δ -tetrahydrocannabinol, and 12 Ss were tested following 0, 0.48, 0.72, or 0.96 g/kg of ethanol. There was a dose-related decrement in reinforced responses after marihuana, and a shift toward errors of premature responding was observed with increasing doses. Ethanol had no reliable effects on the schedule-controlled behavior at any dose. Marihuana also had a dose-related effect on pulse rate and subjective ratings of the degree of "high." Results indicate that marihuana, in contrast to alcohol, interferes with temporally controlled responding even when there is a maximum of feedback concerning response accuracy.—*Journal abstract.*

415. Chen, Chia-Shong & Fuller, John L. (Monash U, Clayton, Australia) Neonatal thyroxine administration, behavioral maturation, and brain growth in mice of different brain weight. *Developmental Psychobiology*, 1975(Jul), Vol 8(4), 355-361.—Injected levothyroxine subcutaneously in amounts of .5, 1, and 2 μ g daily from age 5 through 14 days in 3 lines of Binghamton BWS mice selected for high, medium, or low brain weight. Controls (injected with vehicle only) of these lines differed in ages of eye opening, 1st auditory startle, and perfection of a surface-righting response. Thyroxine at 0.5 μ g/day accelerated the maturation of eye opening, auditory startle, and aerial-righting response but had no effect on a grasping response or open-field activity. Brain weights were depressed significantly in all thyroxine treated groups except in the .5- μ g dosage in high brain weight Ss.—*Journal abstract.*

416. Chopra, Y. M. & Dandiya, P. C. The relative role of brain acetylcholine and histamine in perphenazine catatonia and influence of antidepressants and diphenhydramine alone and in combination. *Neuropharmacology*, 1975(Aug), Vol 14(8), 555-560.—Correlated the brain content of acetylcholine and histamine in perphenazine-induced catatonia and examined the protective effects of a number of antidepressants singly or in combination with diphenhydramine in male Haffkin albino rats. The stage IV of catatonia caused by perphenazine was evident within 15 min of its administration. A concomitant rise in brain acetylcholine and histamine content occurred, suggesting that drug-induced catatonic symptoms are produced by a simultaneous increase of brain acetylcholine and histamine. All the antidepressants used singly or in combination with the antihistamine agent, antagonized the perphenazine-induced elevation of these amines. The anticholinergic action might be due either to an increase of dopamine content in the brain or to their ability to inhibit the release of brain acetylcholine. The different stages of catatonia appear to be directly correlated with brain histamine content.—*Journal abstract.*

417. Clay, George A. & Brougham, Linda R. (Searle Lab, Chicago, IL) Haloperidol binding to an opiate receptor site. *Biochemical Pharmacology*, 1975(Jul), Vol 24(13-14), 1363-1367.—Haloperidol, a non-narcotic neuroleptic drug, has been reported to effectively reduce narcotic withdrawal symptoms in humans receiving treatment for heroin addiction. Results of the present study in vitro show that morphine and haloperidol bound to the rat brain opiate receptor and inhibited

binding of labeled naloxone; both drugs were bound in a competitive manner to the opiate receptor.

418. Colasanti, Brenda & Khazan, Naim. (West Virginia U, Medical Ctr) Electroencephalographic studies on the development of tolerance and cross tolerance to mescaline in the rat. *Psychopharmacologia*, 1975, Vol 43(3), 201-205.—Obtained continuous EEG and EMG recordings from adult female Sprague-Dawley rats with permanent cortical and temporalis muscle electrodes. Automatic ip injections of mescaline were administered at an initial dose of 30 mg/kg every 6 hrs for the 1st 2 days. This dose was then increased to 60 mg/kg/6 hrs which was given for the duration of the study. The initial injections of the mescaline induced an immediate desynchronization of the EEG and behavioral arousal which endured for 2-3 hrs. After this time, slow wave (SW) sleep and rapid eye movement (REM) sleep episodes reappeared, with the return of regular alternations of the sleep-wakefulness cycle. Upon continued administration of the drug, partial tolerance to the arousal effects of mescaline developed, which was reflected by a gradual reduction in the latencies to onset of SW and REM sleep. Ss were cross-tolerant to LSD and N,N-diethyltryptamine (DET). In contrast, cross-tolerance did not occur to amphetamine, which exerts similar arousal and EEG desynchronizing effects. Results support the usefulness of the EEG as a quantitative indicator of CNS functions. (24 ref)—*Journal abstract.*

419. Costa, E.; Guidotti, A.; Mao, C. C. & Suria, A. (NIMH, Lab of Preclinical Pharmacology, St Elizabeths Hosp, Washington, DC) New concepts on the mechanism of action of benzodiazepines. *Life Sciences*, 1975(Jul), Vol 17(2), 167-185.—Notes that several investigations have indicated that the actions (ataxia, muscle relaxation, and convulsion antagonism) of benzodiazepines, including chlordiazepoxide and diazepam, may be mediated by a change in the function of γ aminobutyric acid (GABA)-ergic neurons. Experimental evidence is detailed which supports the concept that benzodiazepines exert their action on the CNS through a facilitation of GABAergic transmission. This evidence establishes a unified concept to explain reports which indicate that diazepam slows down the turnover rate of catecholamines, serotonin, and acetylcholine. These actions may be explained by assuming that diazepam, by acting on regulatory GABAergic neurons, can influence several neuronal systems of the CNS. These findings suggest a role of GABA neurons in anxiety and other symptoms of neurosis for which diazepam is presently the remedy of choice. (59 ref)—*B. McLean.*

420. Curzon, G. & Knott, P. J. (Inst of Neurology, London, England) Rapid effects of environmental disturbance on rat plasma unesterified fatty acid and tryptophan concentrations and their prevention by antilipolytic drugs. *British Journal of Pharmacology*, 1975(Jul), Vol 54(3), 389-396. Removal of group-housed 24-hr fasted rats, but not fed rats, from cages resulted in increased plasma unesterified fatty acid (UFA) concentration in the remaining Ss. The increase of UFA was associated with significant increases in the proportion of free tryptophan and significant falls of total tryptophan concentration. These rapid changes were not associated with brain tryptophan changes.

Plasma tyrosine and erythrocyte tryptophan concentrations were unaffected. Plasma UFA concentrations correlated positively and significantly with corticosterone concentrations which were also increased following removal of cage mates. Plasma UFA increases and tryptophan changes in fasting Ss were both prevented by nicotinic acid and propranolol; corticosterone concentration was increased by nicotinic acid but unaffected by propranolol.—*Journal abstract.*

421. DiMascio, Alberto. **Psychedelic drugs.** *Massachusetts Journal of Mental Health*, 1974(Fal), Vol 5(1), 68-81.—Describes 5 major chemical classes of psychedelic drugs: those derived from, (a) lysergic acid, (b) indolealkylamine (or tryptamine), (c) phenylethylamine, (d) phenylcyclohexyl, and (e) benzylic acid ester. The historic uses of drugs in each class are mentioned, their physiologic or pharmacologic actions are described, and their behavioral and psychiatric effects are discussed. Some observations are from laboratory studies and others are based on reports of drug users. Treatment is briefly considered, with the suggestion that except in extreme cases, verbal and social intervention is the preferred treatment. Because psychedelic drugs are rarely sold on the street in pure form, pharmacotherapy needs to be carefully evaluated.—*P. R. Sweet.*

422. Dyck, Dennis G.; Lussier, Don & Ossenkopp, Klaus-Peter. (U Manitoba, Winnipeg, Canada) **The partial punishment effect following minimal acquisition training: Sodium amobarbital and the stimulus properties of early punished trials.** *Learning & Motivation*, 1975(Aug), Vol 6(3), 412-420.—In a runway investigation, 6 groups ($n = 10$) of male albino rats received limited runway training such that partial punishment, partial reinforcement, or continuous reinforcement was accompanied by sodium amobarbital or saline. Following an interpolated phase of continuous reinforcement without injections, all groups were given punished extinction. The entire experiment was conducted under widely spaced conditions (intertrial interval 24 hrs). It was found that partial punishment increased resistance to punished extinction relative to partially and continuously reinforced controls when acquisition was given under saline. When partial punishment training was accompanied by amobarbital, this effect was eliminated. The drug was observed to have no effect on the punished extinction performance of the partial reinforcement and continuous groups, respectively. Moreover, the partial reinforcement effect did not generalize to punished extinction. Data provide information concerning the difference between the stimuli associated with the early trials of punishment and nonreward and indicate that the former but not the latter contain emotional elements.—*Journal abstract.*

423. Edery, H. & Gottesfeld, Zehava. (Tel-Aviv U, Medical School, Israel Inst of Biological Research, Ness-Ziona) **The γ aminobutyric acid (GABA) system in rat cerebellum during cannabinoid-induced cataleptoid state.** *British Journal of Pharmacology*, 1975(Jul), Vol 54(3), 406-408.—Investigated whether the concentration of GABA, its synthesis by glutamic acid decarboxylase (GAD), or the uptake of GABA by nerve terminals is affected during the cannabinoid-induced cataleptoid state in rats. Repeated, but not single, intraperitoneal

injections of 20 mg/kg of Δ^9 -tetrahydrocannabinol (THC) administered to rats daily for 2 wks produced increased GABA concentration, decreased GAD, and enhancement of ^3H -GABA uptake by cerebellar crude synaptosomes. It is concluded that the motor impairment elicited by THC apparently is not associated with the GABA system but not be related to changes in brain excitability.—*Journal abstract.*

424. Evans, Hugh L.; Ghiselli, William B. & Patton, Robert A. (U Rochester, Medical & Dental School) **Diurnal rhythm in behavioral effects of methamphetamine, p -chloromethamphetamine and scopolamine.** *Journal of Pharmacology & Experimental Therapeutics*, 1973, Vol 186(1), 10-17.—Rats were housed and tested under a controlled cycle of 12 hrs light-12 hrs dark. Effects of drugs on free-operant avoidance and FI performance varied from enhancement to depression, depending on the stage of the light-dark cycle at which the drug was administered. Methamphetamine produced the greatest increase in leverpressing when administered during the dark period, regardless of whether responding was maintained by food or electric shock. Methamphetamine increased locomotor activity at least as much during the light as during the dark, which suggests a dissociation between effects on operant behavior and effects on locomotor activity. Alpha-methyltyrosine was a more effective antagonist of methamphetamine effects in the light than in the dark. Unlike methamphetamine, para-chloro-methamphetamine was more effective in increasing responding during the light period. The dose of scopolamine which was most effective in increasing avoidance responding varied from 0.2 mg/kg in the dark to 0.8 mg/kg in the light. Results are discussed with reference to reported diurnal rhythms in behavioral toxicity and in brain amines.—*Journal abstract.*

425. Firth, Hugh & Oswald, Ian. (Royal Edinburgh Hosp, Scotland) **Eye movements and visually active dreams.** *Psychophysiology*, 1975(Sep), Vol 12(5), 602-606.—There are a number of reports suggesting an association between profusion of eye movements and active dreaming. It has been suggested that this relationship might only be evident in comparisons across the night and in comparisons within one REM period. Data from 20 Ss taking placebo, amylobarbitone (200-400 mg nightly), and nitrazepam (10-20 mg nightly) were used to test this. Dream reports were collected from REM awakenings and rated blind as visually active or passive. Eye movement profusion (number of 2-sec epochs) was assessed for each REM period. Correlation between dream content and eye movement was low but significant in comparisons including the whole night and data from drug, withdrawal, and placebo conditions. A significant correlation was not consistently obtained, however, when data from each REM period were considered separately. Correlations based on data from nondrug nights only were also small and could have been due to chance effects alone. The low correlations were not explicable solely by poor reliability of content ratings. It is concluded that the relationship between visually active dreaming and eye movement is slight and may not hold when time of night is adequately controlled. (25 ref)—*Journal abstract.*

426. Fiume, Sebastiano & Bonfigli, Luisa. (U Roma, Clinica delle Malattie Nervose e Mentali, Italy) [The relationship between the prolonged use of neuroleptic drugs and extrapyramidal syndromes.] (Ital) *Rivista di Psichiatria*, 1974(Nov-Dec), Vol 9(6), 537-543.—Presents 3 cases to illustrate many observations found in the literature that prolonged use of psychotropic drugs may give rise to irreversible choreiform extrapyramidal syndromes.

427. Foote, Stephen L.; Freedman, Robert & Oliver, A. Paul. (NIMH, Div of Special Mental Health Research, St Elizabeths Hosp, Washington, DC) Effects of putative neurotransmitters on neuronal activity in monkey auditory cortex. *Brain Research*, 1975, Vol 86(2), 229-242.—Studied the effects of microiontophoretic applications of norepinephrine (NE), gamma-aminobutyric acid (GABA), and acetylcholine (ACh) on auditory cortex neurons which were activated acoustically by species-specific vocalizations in 7 adult male awake squirrel monkeys. Dose-dependent inhibition of spontaneous and vocalization-evoked discharge rates was found with NE and GABA. Generally, excitation was observed with ACh. A given dose of NE or GABA reduced spontaneous activity by a greater proportion than it reduced activity evoked by the vocalizations. In some cases the differential inhibition of slow activity produced by NE or GABA did result in a pattern change. Data suggest that NE and GABA may function as neurotransmitters in this neocortical area and offer clues about their functional significance. (45 ref) —*Journal abstract*.

428. Fregly, Melvin J. (U Florida, Medical Coll) Effect of an oral contraceptive on spontaneous running activity, salt appetite and blood pressure of ovariectomized rats. *Journal of Pharmacology & Experimental Therapeutics*, 1972, Vol 182(2), 335.—Dietary administration of Enovid to rats was accompanied by an immediate reduction in spontaneous running activity and an abolition of its cyclic pattern. Escape from the effects of the drug occurred approximately 60 days after treatment began. It was characterized by a return of the cyclic pattern of activity, although length of the activity cycle was increased above that observed prior to treatment. Ovariectomy greatly reduced activity level of controls and abolished its cyclic pattern. Treatment with Enovid appeared to maintain activity of ovariectomized Ss at a level considerably higher than that of controls, but a cyclic pattern was not observed. Systolic blood pressure and heart, kidney, adrenal, and uterine weights were all increased significantly by treatment. In addition, a striking appetite for either 0.15 or 0.25 M NaCl solution was observed when the treated ovariectomized Ss were given choice between either of them and distilled water. Results suggest that administration of Enovid for nearly 8 mo at the dose used was accompanied not only by changes in spontaneous activity but by the development of hypertension as well.—*Journal abstract*.

429. Gadusek, Frank J. & Kalat, James W. (Duke U) Effects of scopolamine on retention of taste-aversion learning in rats. *Physiological Psychology*, 1975(Jun), Vol 3(2), 130-132. Tested the hypothesis that learning and memory are due to altered conductance at central cholinergic synapses. Mongrel laboratory rats were

poisoned with lithium chloride 90 min after drinking a novel sucrose solution. 2 or 4 days later, they were tested for learned aversions to sucrose while under the influence of various doses of scopolamine. In 3 replications (using 45, 44, and 35 Ss, respectively), the evidence failed to indicate any substantial effect of scopolamine on retention of learned taste aversions. It is suggested that taste-aversion learning may be less dependent on changes in cholinergic synapses than are certain other types of learning.—*Journal abstract*.

430. Geyer, Mark A.; Dawsey, W. John & Mandell, Arnold J. (U California, San Diego) Differential effects of caffeine, D-amphetamine and methylphenidate on individual raphe cell fluorescence: A microspectrofluorimetric demonstration. *Brain Research*, 1975, Vol 85(1), 135-139.—Administered either 50 mg/kg caffeine, 25 mg/kg methylphenidate hydrochloride, 7.5 mg/kg dextroamphetamine sulfate, or saline (all given ip) to 18 male Sprague-Dawley rats. Findings indicate not only that caffeine and amphetamine or methylphenidate have opposite effects on the intraneuronal fluorescence of raphe cell bodies but also that the raphe nuclei themselves may respond differentially to a given pharmacological treatment.

431. Gispén, Willem H.; Krivoy, William A.; de Wied, David & Zimmermann, Emery. (Inst of Molecular Biology, Div of Molecular Neurobiology, Utrecht, Netherlands) Effect of rifampicin on development of tolerance to analgesic actions of morphine. *Life Sciences*, 1975(Jul), Vol 17(2), 247-251.—In the 1st series of experiments, the reaction times of male Swiss-Webster mice were determined using the hotplate technique. In the 2nd series of experiments, the reactions of rats were determined using the electric footshock technique. In both series, subcutaneous injection of morphine was observed to alter the responses, and chronic morphine administration resulted in tolerance to these actions of morphine. In both series of experiments, tolerance, defined by these same criteria, was inhibited by the concurrent ip administration of rifampicin.—*Journal abstract*.

432. Glass, Jay D. & Fromm, Gerhard H. (U Pittsburgh, Medical School) Chloralose induced alteration of visually evoked response from specific and non-specific regions of cat neocortex. *Electroencephalography & Clinical Neurophysiology*, 1975(Aug), Vol 39(2), 198-200.—Visually evoked responses (VER) and EEG from the motor cortex (precruciate gyrus) and the visual cortex (marginal gyrus) of cats were recorded 4-7 hrs after the injection of anesthetic doses of alpha-chloralose. VERs from the precruciate gyrus showed a 200-300% increase in amplitude while the VER from the marginal gyrus rarely varied more than 50% in amplitude, and did so independent of the changes in the VER from the precruciate gyrus. The number of large amplitude spikes in the EEG from the precruciate gyrus also increased dramatically, but no definite correlation between changes in VER amplitude and in the number of spikes could be demonstrated. Results suggest a functional separation between specific and nonspecific sensory pathways, with the latter showing a considerably greater sensitivity to level of anesthesia. (French summary) (15 ref)—*Journal summary*.

433. Glick, S. D.; Crane, A. M.; Barker, L. A. & Mittag, T. M. (Mt Sinai School of Medicine, City U New York) **Effects of N-hydroxyethyl-pyrrolidinium methiodide, a choline analogue, on passive avoidance behaviour in mice.** *Neuropharmacology*, 1975(Aug), Vol 14(8), 561-564.—N-Hydroxyethyl-pyrrolidinium methiodide (pyrrolcholine) administered iv impaired passive avoidance learning in female CF1 mice. This effect was antagonized by choline and hemicholinium-3, potentiated by scopolamine, and depending upon the time of injection, either potentiated or antagonized by physostigmine. Results are consistent with the hypothesis that pyrrolcholine disrupts central cholinergic pathways by a presynaptic mechanism. Based on metabolism studies, both in vitro and in vivo, it is postulated that the action of pyrrolcholine is mediated via acetylpyrrolcholine, a putative cholinergic false transmitter.—*Journal abstract*.
434. Golub, Arnold M.; Varn, Mary E. & McCluer, Robert H. (Eunice Kennedy Shriver Ctr for Mental Retardation, Waltham, MA) **Attenuation of cycloheximide-induced amnesia in mice by differential housing.** *Journal of Biological Psychology*, 1974, Vol 16(2), 11-18.—In 3 experiments with 191 C57B1/6J and 60 C57 male mice, Ss were housed either separately or in groups, an environmental manipulation previously reported to cause different patterns of arousal as indexed by the plasma corticosterone response to stimulation. Ss were injected with the amnesic agent cycloheximide (40, 60, 90, or 120 mg/kg) and trained in a passive avoidance situation. Individual housing partially protected mice from the amnesic effects of cycloheximide. This finding indicates that time-dependent memory processes may be modulated by physiological and neurohumoral correlates of arousal in the brain and that housing conditions of animals in studies of memory formation should be very carefully controlled. (20 ref)—*Journal abstract*.
435. Green, A. R.; Hughes, Janet P. & Tordoff, Ann F. (MRC, Radcliffe Infirmary, Oxford, England) **The concentration of 5-methoxytryptamine in rat brain and its effects on behaviour following its peripheral injection.** *Neuropharmacology*, 1975(Aug), Vol 14(8), 601-606.—The concentration of 5-methoxytryptamine in male Sprague-Dawley rat brains increased linearly with time over 30 min following its ip injection, tranlycypromine having been given 30 min previously. Injection of 5-methoxytryptamine caused transient behavioral changes. However, when this dose was given following tranlycypromine pretreatment, these changes were considerably enhanced. All doses (2.5-50 mg/kg) of 5-methoxytryptamine injected after tranlycypromine pretreatment produced these behavioral changes. Pretreatment with parachlorophenylalanine or tetrabenazine did not alter the responses. In general, the behavioral changes were similar to those seen following tranlycypromine and levotryptophan, which increases 5-hydroxytryptamine synthesis in the brain. Injection of 5-hydroxytryptamine in which produces similar effects to 5-hydroxytryptamine in isolated tissue preparations but does not enter the brain, did not cause behavioral changes. (12 ref)—*Journal abstract*.
436. Greenberg, I.; Kuhn, D. M. & Appel, J. B. (McLean Hosp. Drug Research Unit, Belmont, MA) **Behaviorally induced sensitivity to the discriminable properties of LSD.** *Psychopharmacologia*, 1975, Vol 43(3), 229-232.—6 male albino Sprague-Dawley rats were initially trained to discriminate LSD from saline in 2-lever operant chambers by reinforcing responses only on 1 lever following ip injections of 80 µg/kg of LSD and only on the 2nd lever following saline injections. Choice responding during extinction periods (no water reinforcement for either response) indicated a high level of discriminability (95% correct) following either LSD or saline. A dose-response curve for LSD, obtained by tests for lever choice after injections of 10, 20, 30, 40, 50, and 60 µg/kg, indicated that 10 µg/kg produced only 30% responding on the LSD lever. This percentage was increased (to 83%) by reinforcing responding on the LSD lever following injections of 10 µg/kg. Subsequent tests indicated that doses of 5.0 and 2.5 µg/kg produced a majority of responses on the LSD lever. Since at these low doses LSD has few measurable biochemical or behavioral effects, it is suggested that the discriminable cue of LSD is related to direct stimulation of central serotonergic receptors. (24 ref)—*Journal abstract*.
437. Guerra, Francisco. **Sex and drugs in the 16th century.** *British Journal of Addiction*, 1974(Sep), Vol 69(3), 269-289.—Quotes the writings of 3 Portuguese and Spanish explorers, showing that García d'Orta, Nicolás B. Monardes, and Cristobal Acosta gave correct descriptions in the 16th century of the Asiatic drugs with psychotropic actions and recorded their toxic effects. Their analysis of these drugs on sexual function and battle fatigue is of particular relevance. References to early studies on psychotropic American drugs are also discussed. It is noted that contemporary publications on this subject reveal an ignorance of fundamental historical sources.—*Journal summary*.
438. Hine, B.; Friedman, E.; Torrelío, Marina & Gershon, S. (New York U, Medical Ctr, Neuropsychopharmacology Research Unit) **Tetrahydrocannabinol-attenuated abstinence and induced rotation in morphine-dependent rats: Possible involvement of dopamine.** *Neuropharmacology*, 1975(Aug), Vol 14(8), 607-610.—Induced turning behavior in male morphine-dependent rats during precipitated abstinence after acute pretreatment with δ^1 - or δ^2 -tetrahydrocannabinol (THC). This THC-stimulated turning varied with degree of morphine dependence and was blocked by haloperidol, but not promethazine. Significant attenuation of naloxone-induced abstinence signs was also observed after acute THC pretreatment, but only in highly dependent Ss. The combination of THC and haloperidol pretreatment was more effective in attenuating abstinence than was either haloperidol or THC pretreatment alone. Data provide additional evidence for the alteration of CNS dopaminergic function in morphine dependence.—*Journal abstract*.
439. Hine, Bromfield; Wallach, Marshall B. & Gershon, Samuel. (New York U, Medical Ctr, Neuropsychopharmacology Research Unit) **Involvement of biogenic amines in drug-induced aggressive pecking in chicks.** *Psychopharmacologia*, 1975, Vol 43(3), 215-221.—Administered various psychoactive drugs to pairs of neonate white leghorn chicks and recorded pecks against each other during 4-hr test sessions. Exp I determined whether drug-induced aggressive pecking is a useful

antidepressant screening model. Although pecking was induced by tricyclics, dextroamphetamine (AMP; 3-12 mg/kg), and levodopa (10-100 mg/kg), ineffective agents included an MAO inhibitor (pargyline; 1-100 mg/kg) and a tricyclic indole antidepressant (iprindole; 1-100 mg/kg). Data do not support the validity of the chick-pecking model as a specific antidepressant test. Exp II determined whether different amines are involved in antidepressant- and CNS-stimulant-induced pecking. Haloperidol (1, 10, and 20 mg/kg) completely antagonized AMP (6 mg/kg) pecking but not imipramine (IMI; 25 mg/kg) pecking, while phentolamine (1 and 10 mg/kg) and propranolol (1 and 10 mg/kg) did not modify AMP pecking, suggesting the involvement of dopamine. In Exp III, chronic para-chlorophenylalanine (5 injections of 150 mg/kg on each of 3 days) pretreatment significantly decreased IMI but not AMP pecking, suggesting the involvement of serotonin. Overall findings indicate that aggressive pecking induced by AMP and IMI may be mediated by different amine systems. (22 ref)—*Journal abstract*.

440. Hodgkinson, Robert et al. (Albert Einstein Coll of Medicine, Yeshiva U) **Local-regional anesthesia during childbirth and newborn behavior.** *Science*, 1975(Aug), Vol 189(4202), 571-572.—Takes issue with the K. Standley et al (see PA, Vol 53:6873) report which concluded that there may be a local drug effect in neonates whose mothers received spinal analgesia. The present authors cite the small size of the sample used and also state that the amount of local anesthetic drug used in spinal block is so small that placental transfer has not been detected. A reply by Standley et al to the present authors is included.

441. Holtzman, Stephen G. & Villarreal, Julian E. (U Michigan) **Operant behavior in the morphine-dependent rhesus monkey.** *Journal of Pharmacology & Experimental Therapeutics*, 1973, Vol 184(3), 528. Monkeys were trained to leverpress under VI or FR schedules of food presentation. In each session, nonpunishment periods in which only the schedule of food presentation was in effect alternated with punishment periods in which the schedule of food presentation was in effect and each response produced the delivery of a brief electric shock to the tail. Punishment periods were designated by a red stimulus light. Morphine, 0.5 to 4.0 mg/kg, depressed unpunished and punished behavior equally. Physical dependence was produced by chronic morphine treatment with subcutaneous injection every 6 hrs at 2 dose levels: 4.0 and 8.0 mg/kg day. Withdrawal from either level of morphine maintenance produced marked decreases in unpunished behavior. Under 1-min VI and 120-response FR schedules, decreases in unpunished responding produced by withdrawal were very consistent. Under FR schedules of 15, 30, or 60 the effects of morphine withdrawal on behavior were highly variable. Punished responding emitted at high baseline rates was decreased by morphine withdrawal. However, punished responding emitted at low baseline rates was increased by withdrawal. *Journal abstract*.

444. Jones, Byron C.; Consroe, Paul F. & Akins, Faren. (U Arizona) **Physostigmine-induced reversal of EEG and behavioral effects of Δ^9 -tetrahydrocannabinol.** *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 204-206.—Measured the effects of Δ^9 -tetrahydrocannabinol (THC) in combination with physostigmine (PHY-SO) on the EEG and behavior of 9 unrestrained adult New Zealand albino rabbits. The increase in mean cortical electrogenesis (voltage output) of the EEG induced by THC was clearly reversed by PHY-SO. Hippocampal theta rhythm disrupted by THC was restored by PHY-SO. Physostigmine also antagonized THC-induced alteration of postural and activity behaviors. Except for very brief periods of retching, no behavioral indications of toxicity were observed. —*Journal abstract*.

445. Kaczmarek, L. K. & Adey, W. R. (U Libre, Service de Chimie Physique, Bruxelles, Belgium) **Modification of the direct cortical response by taurine.** *Electroencephalography & Clinical Neurophysiology*, 1975(Sep), Vol 39(3), 292-294.—Studied the effects of taurine on the direct cortical response (DCR) in immobilized cats (with local analgesia). The primary negative component of the response was inverted in polarity by the topical application of 25 mM taurine while the later slow negative component was considerably augmented. The effects of taurine on the DCR were identical to those observed with gamma-aminobutyric acid. (French summary)

446. Kelleher, R. T.; Morse, W. H. & Herd, J. Alan. (Harvard U. Medical School, Boston) **Effects of propranolol, phentolamine and methyl atropine on cardiovascular function in the squirrel monkey during behavioral experiments.** *Journal of Pharmacology & Experimental Therapeutics*, 1972, Vol 182(2), 204.—Systemic mean arterial blood pressure and heart rate (HR) were measured in monkeys trained under an FR schedule to press a key that turned off a light associated with the delivery of electric shocks. The mean blood pressures were above values previously recorded in untrained squirrel monkeys. Episodic increases in blood pressure and HR were associated with schedule-controlled key-pressing behavior. Phentolamine decreased blood pressure and increased HR. The episodic increases in blood pressure persisted even when phentolamine markedly lowered blood pressure. There was little change in blood pressure after propranolol which markedly decreased HR, or after methyl atropine which increased HR. After either drug the episodic increases in blood pressure persisted. None of these drugs consistently affected keypressing over the range of doses that markedly affected blood pressure or HR. Atropine which had cardiovascular effects similar to methyl atropine decreased rates of keypressing. Combination of propranolol and methyl atropine had effects similar to propranolol.

lol alone; findings suggest that in the squirrel monkey a relatively high degree of sympathetic nervous system tone persists during behavioral experiments.—*Journal abstract*.

447. Klose, K. John et al. (U Miami, FL) **Selective autonomic blockade of conditioned and unconditioned cardiovascular changes in rhesus monkeys (*Macaca mulatta*)**. *Journal of Comparative & Physiological Psychology*, 1975(Sep), Vol 89(7), 810-818.—Examined changes in heart rate and systolic and diastolic blood pressures in 8 rhesus monkeys during 6 sessions of differential classical conditioning. The conditioned stimuli consisted of tones differing in frequency, and the unconditioned stimuli consisted of tail shock. Both the CRs and UCRs consisted of increases in heart rate and in systolic and diastolic pressures, but blood pressure CRs sometimes occurred in the absence of heart rate CRs. In Exp II, graded doses of the selective blocking agents propranolol, phentolamine, and atropine methylnitrate were systemically administered to 4 of the Ss prior to additional conditioning sessions. Results suggest that the CRs and UCRs were mediated by both sympathetic and parasympathetic influences. (15 ref)—*Journal abstract*.

448. Knowler, William C. & Ukena, Thomas E. (Harvard U, Medical School, Boston) **The effects of chlorpromazine, pentobarbital, chlordiazepoxide and α -amphetamine on rates of licking in the rat**. *Journal of Pharmacology & Experimental Therapeutics*, 1973, Vol 185(3), 385-397.—Determined times between successive licks for rats licking water from a drinking tube. The distribution of interresponse times (IRTs) during bursts of rapid licking was highly peaked and stable over long periods of time and under different degrees of water deprivation. Dose-effect relations were determined for chlorpromazine, pentobarbital, chlordiazepoxide, and amphetamine on the mean and standard deviation of IRTs and several other characteristics of the Ss' drinking behavior. Both the mean and the standard deviation of IRTs during bursts of rapid licking were increased by chlorpromazine, pentobarbital, and chlordiazepoxide. In contrast, amphetamine slightly decreased the mean IRT at low doses and increased it at higher doses. Chlorpromazine and amphetamine caused a decrease in total volume of water consumption. Chlordiazepoxide and low doses of pentobarbital increased water consumption, but higher doses of pentobarbital resulted in a decrease in volume consumed.—*Journal abstract*.

449. Krauz, V. A. (USSR Academy of Medical Sciences, Inst of Experimental Medicine, Leningrad) **[The effect of cholinergics on the short-term memory and the excitability level of the hippocampus circle structures.]** (Russ) *Farmakologiya i Toksikologiya*, 1974, Vol 37(6), 662-664.—Studied the effects of pilocarpine and nicotine on short-term memory in 7 dogs with electrodes chronically implanted in various brain structures. After a maximal time delay for the correct choice of food trough following an acoustic or visual signal had been established, pilocarpine (1-3 mg/kg) and nicotine (0.2-0.3 mg/kg) were introduced intramuscularly, and the effects on behavior and the functional state of the hippocampal circle structures were studied. Both drugs were found to improve short-term memory in these doses. Both drugs lowered the level of excitability of the

dorsal hippocampus and the mamillary bodies of the hypothalamus, increased the level in the ventral hippocampus, and had no effect on the functional state of the anterior-ventral thalamus. (English summary)—A. G. Pook.

450. Laird, Porter V.; Braud, William G.; Meador, Steven T. & Galvan, Louis M. (U Houston) **Biochemical transfer of a classical conditioning effect revealed through reinstatement and reinforced learning procedures**. *Journal of Biological Psychology*, 1974, Vol 16(2), 19-22.—Conducted 2 experiments in which reinstatement and reinforced learning procedures were used to detect the behavioral activity of brain extracts from classically conditioned donor goldfish. In Exp I, 24 goldfish were given differential classical conditioning training in which a green light signaled shock. In Exp II, blue light signaled shock in a similar classical paradigm. Naive donor groups provided control brain material. Extracts rich in both RNA and protein were extracted from donor brains and injected intracranially into naive recipient goldfish which were tested for color avoidance 72 hrs after injection. At 48 hrs after injection, all recipient groups had been given reinstatement or reminder trials consistent with the training of their appropriate donors. Recipients of control extract learned blue- and green-avoidance tasks equally (as predicted). However, recipients of trained brain extracts learned the task homologous to that of their appropriate donors significantly better than they did an antagonistic task. Results suggest that reinstatement and reinforced testing may make dramatically evident a classical conditioning transfer effect to which previously used recipient test procedures were insensitive.—*Journal abstract*.

451. Laties, Victor G. (U Rochester, Medical Ctr) **The modification of drug effects on behavior by external discriminative stimuli**. *Journal of Pharmacology & Experimental Therapeutics*, 1972, Vol 183(1), 1-13.—Compared drug effects on pigeons working on 2 schedules of reinforcement. Both schedules demanded that at least 8 consecutive responses be made on 1 key before a peck on a 2nd key would be reinforced; if the S switched before the count of 8, the series of responses had to be started again. On 1 schedule, no external stimulus change occurred with the 8th response. On the 2nd, such a change occurred invariably. The addition of the cue modified performance considerably, with the Ss becoming much more efficient in just meeting the required minimum count before switching to the reinforcement key. When a discriminative stimulus was not present, chlorpromazine, promazine, dextroamphetamine, and scopolamine led to pronounced increases in premature switching to the reinforcement key. The addition of the external discriminative stimulus attenuated the effects of scopolamine and dextroamphetamine most, chlorpromazine and promazine least. Haloperidol had less effect on these performances even though it, like the other drugs, could produce dose-related decreases in rate measures.—*Journal abstract*.

452. Lieberburg, Ivan & McEwen, Bruce S. (Rockefeller U, New York, NY) **Estradiol-17B: A metabolite of testosterone recovered in a cell nuclei from limbic areas of neonatal rat brains**. *Brain Research*, 1975, Vol 85(1), 165-170.—Examined the levels of [3 H] estradiol-

17-beta (E_2) which accumulated in cell nuclei of various limbic areas of the rat brain after an injection of radioactive [3H]testosterone (T). Data from 5-day-old (chosen because of the relatively high levels of aromatization) CD Sprague-Dawley rats demonstrate the enrichment of E_2 (as a T metabolite) in the limbic area cell nuclei which is consistent with the existence of aromatization in the brain. The relationship of aromatization to sexual differentiation is noted. (22 ref)

(U Brasilia, Lab de Neurobiologia, Brazil) **Identification of corticotectal cells of the visual cortex of cats by means of horseradish peroxidase.** *Brain Research*, 1975, Vol 83(3), 474-479.—Administered intracollicular injections of 0.1–0.5 μ l of a 20% solution of horseradish peroxidase (HRP) to 10 anesthetized adult cats. The use of the retrograde HRP-labeling method in this study identified layer V pyramidal cells as the origin of the corticotectal pathway arising from area 17. (17 ref)

454. McBurney, Donald H. & Moskat, Lawrence J. (U Pittsburgh) **Taste thresholds in college-age smokers and nonsmokers.** *Perception & Psychophysics*, 1975(Aug), Vol 18(2), 71-73.—Conducted 4 experiments to measure taste detection thresholds for NaCl and Dulcin, and recognition thresholds for NaCl, sucrose, HCl, and QSO, in a total of 100 college student smokers and nonsmokers. There were no consistent differences in thresholds for any compound between smokers and nonsmokers. (15 ref)—*Journal abstract*.

455. Middaugh, Lawrence D.; Santos, Carroll A. & Zemp, John W. (Medical U South Carolina) **Effects of phenobarbital given to pregnant mice on behavior of mature offspring.** *Developmental Psychobiology*, 1975(Jul), Vol 8(4), 305-313.—23 mature offspring of C57BL/6J mice (*Mus musculus*) subcutaneously injected daily with phenobarbital (40 mg/kg) for the last third of pregnancy differed from 26 saline and 31 untreated control Ss on 3 measures of behavior. Offspring of phenobarbital treated Ss had higher locomotor scores than controls during an open field activity test at 75 days of age. Male offspring were also tested on a 1-trial passive avoidance task, and treated Ss were found to be deficient. Female offspring responded less than controls on fixed ratio schedules of reinforcement. The behavioral changes suggest that offspring of mice injected with phenobarbital during pregnancy are less responsive to the stimuli in their environment which maintain behavior. (21 ref) —*Journal abstract*.

456. Milstein, Stephen L.; MacCannell, Keith; Karr, Gerry & Clark, Stewart. (INRS-Santé, Hôpital St-Jean-de-Dieu, Montréal, Canada) **Marijuana-produced changes in pain tolerance: Experienced and non-experienced subjects.** *International Pharmacopsychiatry*, 1975, Vol 10(3), 177-182. Compared the effect of marijuana and placebo on pain tolerance in 16 cannabis-experienced and 16 naive Ss. Each group contained 8 males and 8 females who received either 600 mg of 1% Δ -tetrahydrocannabinol or placebo. Pain tolerance was measured with a pressure algometer. A statistically significant increase in tolerance was observed after smoking marijuana. Although there was no statistically significant interaction between the drug effect and having had previous cannabis experience, there was a

definite trend towards a greater increase in tolerance for the experienced (16%) compared to the naive group (8%). —*Journal abstract*.

457. Nakamura, Keiji & Nakamura, Kazuo. (Nippon Roche Research Ctr, Kamakura, Japan) **Mechanisms of central hypotensive activity of L-DOPA and a peripheral decarboxylase inhibitor in DOCA-salt hypertensive rats.** *Japanese Journal of Pharmacology*, 1975(Apr), Vol 25(2), 93-100.—Experimental results show that levodopa plus RO-4-4602 lowered the blood pressure of desoxycorticosterone acetate (DOCA) hypertensive rats. It is suggested that this was due to stimulation of alpha-adrenoceptor in the brain stem with effluxed noradrenaline after dopamine accumulation in the brain stem noradrenergic neurons and partly due to blockade of the brain stem pressor areas. (29 ref)

458. Nistri, A.; De Bellis, Angiola M. & Cammelli, Emanuela. (U Florence, Faculty of Medicine, Inst of Pharmacology, Italy) **Drug-induced changes in behavior and ganglionic acetylcholine concentration of the leech.** *Neuropharmacology*, 1975(Aug), Vol 14(8), 565-569. In vivo determination in anesthetized leeches showed that the sensitivity of leech acetylcholine-containing cells to centrally acting drugs (leptazol, eserine, scopolamine, and oxotremorine) differs from that of mammalian brain neurones. This difference should be taken into account before considering the leech ganglia as models of mammalian cholinergic systems. (20 ref)

459. Oka, Makoto & Shimizu, Masanao. (Daicopon Pharmaceutical, Research Lab, Japan) **A simple avoidance procedure for testing psychotropic drugs in mice.** *Japanese Journal of Pharmacology*, 1975(Apr), Vol 25(2), 121-127. Used a box with dark and light compartments to test psychotropic drugs in male STD-ddY strain mice. Ss were put into the dark compartment where they would be punished unless they moved into the light compartment within 5 sec. Most Ss acquired active avoidance in less than 50 successive trials. Major tranquilizers such as chlorpromazine, haloperidol, clozapine, and oxypertine depressed the avoidance response at intraperitoneally administered doses lower than those at which the escape response was impaired. Diazepam and dexepim had depressant effects at doses which impaired the escape response. Imipramine and nortriptyline did not affect the avoidance response at the doses tested. It is concluded that mice quickly acquire an active avoidance under the present procedure and that this conditioned behavior is selectively depressed by major tranquilizers. (21 ref) —*Journal abstract*.

460. Patterson, Carroll D. (Tri-County Community Mental Health Ctr, North Kansas City, MO) **Self-reported unpleasant effects from illicit use of fourteen substances.** *British Journal of Addiction*, 1975(Sept), Vol 69(3), 249-255.—Over a 6-mo period, 19948 military inductees were surveyed by means of an anonymous questionnaire about their previous illicit usage of 14 substances, including amphetamines, barbiturates, hallucinogens, marijuana, and heroin. Of these men, 6203 (32%) indicated usage at least once of one or more of the substances. Of the 6203 users, 16% reported that they had experienced an unpleasant effect from their drug use upon one or more occasions. The substance most often mentioned as causing unpleasant effects was LSD.

followed at some distance, in 2nd and 3rd place, by heroin and STP (DOM, 2,5-dimethoxy-4-methylamphetamine). The average number of other drugs used by those reporting unpleasant effects varied from 7.6 in the heroin users to 1.4 in the marihuana users.—*Journal abstract.*

461. Perrin, R. G.; Kalant, H. & Livingston, K. E. (U Toronto, Ontario, Canada) **Electroencephalographic signs of ethanol tolerance and physical dependence in the cat.** *Electroencephalography & Clinical Neurophysiology*, 1975(Aug), Vol 39(2), 157-162.—Recorded spontaneous electrical activity from 3 cortical and 5 subcortical sites, via permanently implanted electrodes, in 5 conscious, freely-moving adult cats. Initial observations were made during and after an intravenous infusion of ethanol, 1 gm/kg. Ss then received ethanol by gastric intubation, in doses of 1.5 gm/kg every 8, 12, or 24 hrs for 5 wks. Electrical and behavioral observations were repeated on the day following the last gavage, before and during another iv infusion of ethanol. All Ss showed EEG changes which were interpreted as signs of tolerance to and dependence on alcohol. EEG changes appeared up to a day earlier than gross behavioral signs of alcohol withdrawal. (French summary)—*Journal summary.*

462. Reid, Lloyd D. & Ibrahim, Mohammad F. (U Toronto, Inst of Aerospace Studies, Canada) **The application of human operator describing functions to studies on the effects of alcohol and marijuana on human performance.** *IEEE Transactions on Systems, Man, & Cybernetics*, 1975(Sep), Vol 5(5), 506-519.—Conducted 2 experiments with a total of 25 paid male university students to study the application of human operator describing functions in the investigation of the influence of drugs (alcohol and marihuana) on Ss performing a compensatory visual-manual tracking task. The describing functions were measured through the application of power spectral density techniques to the signals circulating in the control loop. A range of drug dosages was employed which included alcohol alone, marihuana alone, and a combined dose of marihuana and alcohol. Significant alterations in the describing functions were observed and interpreted as changes in amplitude, phase, and operator injected noise (remnant). Linear models fitted to the raw describing function data are used to summarize the observed trends in the human operator's dynamic characteristics. Results provide an insight into the changes in human performance produced by alcohol and marihuana.—*Journal abstract.*

463. Risner, Marc E. & Jones, B. E. (National Inst on Drug Abuse, Addiction Research Ctr, Lexington, KY) **Self-administration of CNS stimulants by dog.** *Psychopharmacologia*, 1975, Vol 43(3), 207-213.—Trained 12 drug-naïve dogs to respond for iv infusions of either dextroamphetamine, phenmetrazine, or methylphenidate until a stable response rate in each 4-hr daily session was achieved. The magnitude of reinforcement (mg/kg/infusion) was then varied systematically across a wide range for each drug. An inverse relationship between unit dose and number of self-administered infusions/session was found. Using a parallel line bioassay design, the relative potencies of dextroamphetamine, phenmetrazine, and methylphenidate to maintain self-administration were

estimated. By comparing the unit doses of dextroamphetamine which yielded the same rate of self-administration, it was found that 1 mg of phenmetrazine is equivalent to 0.1 mg of amphetamine. It was also determined that 1 mg of methylphenidate is equivalent to 0.75 mg of amphetamine. Data indicate that the dog can be used to assess the reinforcing properties of psychomotor stimulants. (27 ref)—*Journal abstract.*

464. Roffler-Tarlov, Suzanne. (Children's Hosp Medical Ctr, Neurology Research, Boston, MA) **Differences between the effects of acute and long-term treatment with desmethylimipramine on reserpine-induced release of amines from rat brain.** *Biochemical Pharmacology*, 1975(Jul), Vol 24(13-14), 1321-1325.—Investigated the neurochemical consequences of chronic administration of tricyclic antidepressants, since their clinical efficacy appears only after long-term treatment. A single ip injection of the tricyclic antidepressant drug desmethylimipramine (DMI) caused a small, transient, and consistent retardation of reserpine-induced release of male Sprague-Dawley rat brain norepinephrine but not of dopamine and serotonin. In contrast, long-term treatment with desmethylimipramine enhanced the release of brain norepinephrine, dopamine, and serotonin after reserpine. It was found that the older Ss (80 days old) were less sensitive than the younger (50 days old) to the brain amine depletion caused by reserpine. However, the antagonism between acute DMI and reserpine occurred in both young and old Ss. Results agree with reports of an intraneural site of action of DMI. It is possible that intraneural changes in brain and in the neuronal systems which use dopamine, serotonin, and norepinephrine may contribute to the improvement in mental depression which occurs after long-term treatment with tricyclic antidepressant drugs. 465. Saarma, J. et al. (Tartu State U, Lab of Psychopharmacology, USSR) **The effect of succinic semialdehyde and sodium succinate on the higher nervous activity in normal subjects.** *International Pharmacopsychiatry*, 1975, Vol 10(3), 149-156.—Studied the action of succinic semialdehyde (SSA) and sodium succinate (SS) on nervous activity in 39 normal volunteers. Ss receive either 1,000 mg SSA/day for 10 days or 1,000 mg SS 3 times/day for 10 days. Nervous activity was assessed using the Tartu test battery by J. Saarma which consists of operant memory, learning, word association, calculation, proofreading, and motor reflex tests. Ss also completed a self-report scale assessing mood, vividness of thinking, memory functions, concentration, sleep, and general psychic and physical condition. Results show that SSA caused some enhancement of the excitatory process, particularly verbal, in cortical activities, and was accompanied by a subjective improvement of memory and concentration. SS appeared to improve the stability of the cortical excitatory process and its equilibrium with cortical inhibition, and enhanced the connecting activity of the verbal system. It is suggested that succinic acid may be a psychoenergizer. (20 ref)—*Journal abstract.*

466. Siegel, H. I. & Greenwald, G. S. (U Kansas, Medical Ctr, Kansas City) **Prepartum onset of maternal behavior in hamsters and the effects of estrogen and progesterone.** *Hormones & Behavior*, 1975(Sep), Vol 6(3),

237-245.—In Exp I the onset of maternal behavior in 29 pregnant golden hamsters was measured by presenting foster pups at 0900 and 2100 hrs on Day 15 and at 0300, 0500, and 0700 hrs on Day 16 and then at hourly intervals until parturition began. The occurrence of parturition was determined at each maternal test and at 0.5-hr intervals beginning at 0700 hrs on Day 16. Nulliparous and primiparous Ss became maternal at approximately the same time on Day 16, 2 and 6 hrs prepartum, respectively, demonstrating that parturition is not essential for maternal behavior. Exp II showed that 46 nulliparous Ss injected with either 1 or 10 μ g estradiol-17 β (E₂), 0.1 mg progesterone (P), 10 μ g E₂ plus 0.1 mg P, or oil at 1200 hrs on Day 15 became maternal at the same time of day, while parturition was delayed 8 hrs in Ss receiving P. Results suggest a dissociation between the regulation of parturition and maternal care and are compared to previous research into the hormonal basis of maternal behavior in rats.—*Journal abstract.*

467. Slánská, J.; Tikal, K.; Hvizdošová, J. & Benešová, O. (U Karlova, Prague, Czechoslovakia) [Placebo effect related to the type of indoctrination and some personality traits.] (Czec) *Ceskoslovenská Psychiatrie*, 1974(Jun), Vol 70(3), 174-179.—Describes the effects of a placebo administered as a stimulant to 1 group of male and female medical students and as a sedative to another group. Psychological tests were given, pulse rates taken, and 5 bipolar personality traits were measured for all Ss. Methods and results are described in detail. 2 of the 5 measured personality traits correlated significantly ($p < .05$) with the effectiveness of the suggested drug action. Findings suggest that in testing new drugs, personality types and characteristics of Ss should be considered in order to avoid distortion of results.—V. Fischman.

468. Smith, Ronald D.; Cooper, Barrett R. & Breese, George R. (U North Carolina, Medical School, Chapel Hill) Growth and behavioral changes in developing rats treated intracisternally with 6-hydroxydopamine: Evidence for involvement of brain dopamine. *Journal of Pharmacology & Experimental Therapeutics*, 1973, Vol 185(3), 609-619.—Intracisternal administration of 6-hydroxydopamine (6-OHDA) to immature rats produced marked reductions of norepinephrine (NE), dopamine (DA), and tyrosine hydroxylase activity in brain. Accompanying these reductions were alterations in growth and behavior clearly demonstrable when adult. The 6-OHDA-treated Ss showed decrements in eating and drinking, in their intake of a sucrose solution, and in the ability to improve performance during acquisition of a shuttle-box avoidance response. Since choline acetylase activity and tryptophan hydroxylase activity were not altered in brain after this treatment, it seemed unlikely that these neuronal systems were responsible for the observed deficits. To evaluate the roles of NE or DA in the deficits, Ss in which DA was preferentially reduced showed similar deficiencies to those described above, whereas NE-depleted Ss did not show these alterations. Data suggest that the decrements in the 6-OHDA-treated developing Ss were due to reduction in brain DA and support the view that dopaminergic neurons were involved in the maintenance of consummatory behavior

as well as conditioned avoidance responding.—*Journal abstract.*

469. Stewart, Warren J. (La Trobe U, Bundoora, Australia) Size of the environment as a determinant of effects of scopolamine. *Psychological Reports*, 1975(Aug), Vol 37(1), 175-178.—64 female albino rats were injected with either saline or 0.25 mg/kg scopolamine and tested in 1 of 4 different-sized open fields (side lengths of either 12, 24, 36, or 72 in). There was a positive correlation between increasing field size and increased ambulation in undrugged Ss. Scopolamine increased ambulation in Ss in the 2 smaller fields but not in the larger 2 fields, and it did not attenuate the rate of habituation. Rearing and grooming were not affected so much by field size, but grooming was increased by scopolamine. Results are interpreted in terms of base rate-response competition hypotheses.—*Journal abstract.*

470. Stone, T. W. & Bailey, E. V. (U Aberdeen, Marischal Coll, Scotland) Responses of central neurones to amantadine: Comparison with dopamine and amphetamine. *Brain Research*, 1975, Vol 85(1), 126-129.—Investigated the effects of amantadine on single cells in the cerebral cortex and caudate nucleus of male rats and compared the results with responses to dopamine and amphetamine. It is concluded that amantadine stimulates dopamine receptors either directly or by the release of dopamine from presynaptic storage sites, the reduction of dopamine responses may indicate a partial agonist action of amantadine at dopamine receptors. (16 ref)

471. Thompson, Donald M. (Georgetown U, Schools of Medicine & Dentistry) Repeated acquisition as a behavioral base line for studying drug effects. *Journal of Pharmacology & Experimental Therapeutics*, 1973, Vol 185(3), 506-514. Developed a method to study the effects of drugs on learning in which each S served as its own control. Pigeons worked for food reinforcement in a chamber containing 3 response keys, all 3 were illuminated at the same time by 1 of 4 colors. For each session the S's task was to learn a new 4-response sequence by pecking the correct key in the presence of each color. After learning had stabilized, this baseline of repeated acquisition was used to assess the effects of drugs. The dose-effect data indicated that overall accuracy was impaired by phenobarbital, chlordiazepoxide, and dextroamphetamine and that the degree of impairment generally increased as a function of dose. In contrast, chlorpromazine did not affect overall accuracy across the dose range tested, although there was a slight error-increasing effect at the largest doses during the 1st part of the session. All 4 drugs increased pausing as a function of dose. Within session analyses of the effects of the largest doses of phenobarbital, chlordiazepoxide, and amphetamine indicated that the rate at which errors decreased was less in the drug sessions than in the control.—*Journal abstract.*

472. Trabucchi, M.; Cheney, D. L.; Racagni, G. & Costa, E. (NIMH, Lab of Preclinical Pharmacology, St Elizabeths Hosp, Washington DC) In vivo inhibition of striatal acetylcholine turnover by L DOPA, apomorphine and (+)-amphetamine. *Brain Research*, 1975, Vol 89(1), 130-134. Measured the turnover rate of acetylcholine (ACh) in vivo in various areas of the rat brain after

injection of apomorphine, levodopa, and amphetamine. Results suggest that dopaminergic neurons impinge upon cholinergic interneurons in the striatum and exert an inhibitory influence on them. All 3 drugs, which stimulate dopamine receptors, inhibited the rate of firing of dopamine neurons in the pars compacta of the substantia nigra. (26 ref)

473. Tsutsumi, Etsuro; Inaba, Tadanobu; Mahon, William A. & Kalow, Werner. (Kumamoto U, Inst of Constitutional Medicine, Japan) **The displacing effect of a fatty acid on the binding of diazepam to human serum albumin.** *Biochemical Pharmacology*, 1975(Jul), Vol 24(13-14), 1361-1362.—Results in vitro show a displacement of diazepam by a free fatty acid at plasma concentrations encountered during therapeutic use of diazepam for anxiety. The possibility exists that an interaction between diazepam and free fatty acids could be observed clinically in man. It is hypothesized that the fluctuations of diazepam in blood results from variations in plasma free fatty acids, with a consequent change in diazepam binding to albumin and thus in the distribution of diazepam.

474. Vaille, Charles. **A new experimental model for the study of morphinic analgesics.** *Bulletin on Narcotics*, 1975(Jan-Mar), Vol 27(1), 1-17.—Describes a new method for examining the central analgesic activity of drugs utilizing changes in certain peripheral activities, e.g., external pancreatic secretion (in the rat) which is easily quantifiable and reproducible. Administration of 2-deoxy-D-glucose D-glucose causes the pancreatic fluid to be discharged at an increased rate. Methadone blocks this effect. Nalorphine counteracts the methadone effect. Information on chronic experiments is provided. (36 ref)—A. S. Kulkarni.

475. Weissman, Albert. (Pfizer, Inc, Groton, CT) **Jumping in mice elicited by α -naphthoxyacetic acid (α -NOAA).** *Journal of Pharmacology & Experimental Therapeutics*, 1973, Vol 184(1), 11-17.— α -Naphthoxyacetic acid (α -NOAA) elicited repetitive vertical jumping in mice shortly after the administration of ip doses from 237 to 1000 mg/kg. Despite the qualitative similarity of α -NOAA-elicited jumping to that caused by precipitated withdrawal from morphine, α -NOAA did not mimic in other ways the effects of precipitated withdrawal, nor did it interact with morphine in ways suggesting a similarity to known narcotic antagonists. Neither did α -NOAA resemble sodium 5-(1,3-dimethylbutyl)-5-ethyl barbiturate, a convulsant barbiturate recently reported to elicit similar jumping behavior in mice. It is suggested that the jumping response after a α -NOAA offers a potential tool for determining whether agents reported to affect withdrawal jumping, and therefore claimed to alter physical dependence on opiates, have a nonspecific effect on jumping behavior.—*Journal abstract.*

476. Winter, J. C. (State U New York, Medical School, Buffalo) **A comparison of the stimulus properties of mescaline and 2,3,4-trimethoxyphenylethylamine.** *Journal of Pharmacology & Experimental Therapeutics*, 1973, Vol 185(1), 101.—Rats were first trained on a VI schedule of positive reinforcement. 2 drug treatments were then assigned to each S. One treatment was the stimulus in whose presence responses were reinforced on the VI schedule, and the other was the S-delta, the

stimulus in whose presence no responses were reinforced. After 8-12 sessions, a punishment contingency was added (i.e., in the presence of S-delta, responses were punished by the delivery of electric shock on a VI schedule. It was established, in 2 separate groups of Ss, that mescaline, when paired with saline, and 2,3,4-trimethoxyphenylethylamine (TMPEA), when paired with saline, can be discriminative stimuli. In a 3rd group, equivalent doses of mescaline and TMPEA were compared directly. If it is assumed that TMPEA is without hallucinogenic activity, the hypothesis predicts that mescaline and TMPEA will be discriminable in the rat. No evidence of discriminated responding was obtained. Data fail to support the hypothesis that these different pharmacologic properties of hallucinogens and nonhallucinogens in man are reflected in distinctive stimuli in the rat.—*Journal abstract.*

477. Wójcik, Magdalena; Mitros, Katarzyna; Jastreboff, Pawel J. & Zielinski, Kazimierz. (Nencki Inst of Experimental Biology, Warsaw, Poland) **The variability of innate darkness preference in mice: An evaluation of Ungar's design.** *Acta Neurobiologiae Experimentalis*, 1975, Vol 35(3), 285-298.—Attempted to elucidate the controversy surrounding the experiments of G. Ungar examining the effects of scotophobin on dark preference in mice. The behavior of 45 noninjected adult male Swiss albino mice in the type of maze described by Ungar was examined. 7 subsequent tests were conducted for dark box time (DBT) and motor activity. In general, results indicate that DBT in all subpopulations of Ss selected according to different criteria on the preference test fluctuated during the course of experimentation. Further, on the basis of present data, the problem of summation effects from combined probabilities in the series of independent comparisons was readily apparent, so that the probability of obtaining significant differences between groups was increased as the results of Ungar's data analysis. A strong relationship between motor activity and DBT was also obtained, suggesting that other, nonspecific factors may influence motor activity and shorten the elevation of DBT. (30 ref)—*Journal abstract.*

478. Anderson, Hayes L. (Michigan State U) **The effect of filming a television news source by vertical camera angle, horizontal camera angle, and source eye-contact on source credibility and audience attitudes toward the televised message.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1305.

479. Cooney, S. & Allen, T. J. **The technological gatekeeper and policies for national and international transfer of information.** *R & D Management*, 1974(Oct), Vol 5(1), 29-33.—Summarizes the main conclusions of research demonstrating the significance of person-to-person communication in technical information transfer. Some of the major international and national policy statements and projects are reviewed in light of these findings, and suggestions for further development of informal communication channels are made. (25 ref)

480. Hulbrook, Morris B. (Columbia U) A comparison of methods for measuring the interletter similarity between capital letters. *Perception & Psychophysics*, 1975(Jun), Vol 17(6), 532-536.—In perception experiments, measures of interletter similarity are often required, of which the most reliable and valid appears to be J. T. Townsend's (1971) set of similarity parameters based on the Luce choice model. A simple mechanical measure in the present study offered a fairly strong prediction of the Luce choice-model similarity measure, as did a subjective rating measure based on the 10-point visual similarity ratings of 8 adult Ss. By comparison, E. J. Gibson et al's (1963) matching-confusion matrix fared poorly, as did Gibson's (1969) distinctive feature analysis based on a letter pair's number of shared features. Distinctive feature analysis was significantly improved by substituting the feature set proposed by L. H. Geyer and C. G. DeWald (1973) or by weighting the features optimally via regression analysis. Such analyses suggested that figural curvature may be a particularly important perceptual feature, but in no case did these feature-analytic models predict the Luce measure as well as the mechanical or subjective rating measures.—*Journal abstract*.

481. Hymes, Dell. (U Pennsylvania) **Linguistics, language, and communication.** *Communication*, 1974, Vol 1(1), 37-53.—Little is known about language as communication. What is needed is a systematic study of the range of uses and modes of acquisition of languages. By contrast, modern linguistics (e.g., E. Sapir; N. Chomsky) have studied language as an autonomous system and often have treated languages as functionally equivalent. If one starts from linguistic structures (e.g., grammar), an understanding of communicative function and context is impossible. Rather, one must start with function (i.e., the ends served by communication) and look for the structural means by which the function is served. A recommended framework for the description of linguistic features, based on repertoires of speech styles in relation to their contexts and appropriateness, will make the analysis of language inseparable from the analysis of communicative conduct. Furthermore, within this framework linguistics and communication will be linked by 2 concepts: (a) communicative competencies and (b) performances, which refer to the full range of personal abilities that enter into communication and social interaction, respectively. (33 ref)—S. T. Margulis.

482. Vickers, Geoffrey. **Levels of human communication.** *Communication*, 1974, Vol 1(1), 7-24.—Analyzes 3 functions of communication. The most basic function is to establish, change, or maintain the relationship of parties. The 2nd and related function is to change, intentionally or not, one's own or another's appreciative system (i.e., judgmental and valuational criteria) by either coercion, bargaining, or persuasion. Coercion and the bargain rest on reward-cost considerations; persuasion requires taking the role of the other. The 3rd function, meta-communication, helps develop the other 2 functions and, in turn, is developed by them. Meta-communication grows out of the necessary openness and the creative imprecision of language. Institutional and intrapersonal communication are also described.—S. T. Margulis.

483. von der Lieth, Lars. [Nonverbal aspects of total communication.] (Danh) *Psykologisk Skriftserie*, 1973, No 4, 7-25.—Discusses the involvement of 6 sense modalities in communication, including smell. An historical review of the literature in this area is presented, including a discussion of the current author's early work on body language. (74 ref)

484. Worchel, Stephen; Andreoli, Virginia & Eason, Joe. (U Virginia) Is the medium the message? A study of the effects of media, communicator, and message characteristics on attitude change. *Journal of Applied Social Psychology*, 1975(Apr-Jun), Vol 5(2), 157-172.—242 undergraduates received a communication over TV, radio (audio tape), or written medium, which either agreed with a position they held or strongly disagreed with it. The communicator was either a newscaster or a candidate for political office. Results indicate that Ss felt the newscaster to be more trustworthy than the candidate. In line with previous research, there was no main effect of media on persuasiveness. However, media interacted with the other variables so that when the communication disagreed with the audience, TV was the most persuasive medium with the newscaster but the least persuasive with the untrusted candidate. There was no effect for media when the message agreed with the audience. Further, the candidate taking a position congruent with the audience's was rated as more attractive but less trustworthy than a candidate taking the opposite position. It is suggested that TV may be the most involving medium and that either a counterargument theory or reactance theory could explain why it was not effective with the candidate. (23 ref)—*Journal abstract*.

486. Conn, Marjorie; Dancer, Jess & Ventry, Ira M. (Marymount Manhattan Coll) **A spondee list for determining speech reception threshold without prior familiarization.** *Journal of Speech & Hearing Disorders*, 1975(Aug), Vol 40(3), 388-396. Attempted to select a list of spondees from the CID W-1 spondee word list that would eliminate the need for familiarization but produce spondee thresholds equivalent to those obtained with familiarization. 48 16-74 yr olds with normal hearing responded to familiarized and unfamiliarized spondee words at their familiarized spondee threshold levels. Spondee words that were correctly identified most often without prior familiarization or whose correct response rates were least altered by familiarization were selected for the final list. 17 words were selected from the criteria of the present study; 2 of these were excluded from the final list since they did not fall within the recommended 4-db range. The 15 remaining spondee words without familiarization produced spondee thresholds equivalent to the entire CID W-1 list with familiarization in a direct comparison of the 2 lists in 20 Ss.—*Journal abstract*.

490. Huggins, A. W. **Temporally segmented speech. Perception & Psychophysics**, 1975(Aug), Vol 18(2), 149-157.—Temporally segmented speech is continuous speech broken up by the insertion of silent intervals. The durations of the resulting speech intervals and silent intervals can be varied independently. In the present experiment with 8 Ss, when silent intervals were held constant at 200 msec and speech interval duration was varied, intelligibility fell from about 90% to about 10% as speech interval duration was reduced from 200 to 30 msec. When speech interval duration was held constant at 63 msec and silent interval duration was varied, intelligibility recovered from its asymptotic value of about 50% with long silent intervals, to 100% as the silent intervals were shortened from about 120 msec to about 60 msec. Implications for short-term acoustic storage are discussed. (23 ref)—*Journal abstract*.

491. Kolers, Paul A. (U Toronto) **Specificity of operations in sentence recognition.** *Cognitive Psychology*, 1975(Jul), Vol 7(3), 289-306.—When we read a sentence do we abstract out its semantic core and discard the surface representation, or is the surface representation an integral part of the encoded sentence? The present 3 experiments studied this question by measurement of transfer to a 2nd reading of a sentence of skill acquired in a 1st encounter with the sentence. A total of 19 undergraduates and 9 English-French bilingual adults were Ss. The transfer relation was studied when the typography, language, or modality of the 1st and 2nd embodiments were varied. Results favor a theory that emphasizes recognition in terms of the pattern analyzing operations that are directed at surface lexical representations. A distinction is brought out between operational or procedural memory and substantive or semantic memory. In many cases memory of procedures may be sufficient to recover the information encoded. Stage-wise processing theories do not seem to have place for such notions.—*Journal abstract*.

492. Russ, Raymond C.; Gold, Joel A. & Cherulnik, Paul D. (U Maine, Orono) **Semantics and structure: A comparison between monolingual and bilingual subjects.** *Journal of Social Psychology*, 1975(Aug), Vol 96(2), 163-172.—20 English-speaking monolingual and 20 French-American bilingual undergraduates were given 11 words to encode to obtain certain measures of codability: latency, reaction time, number of words, number of syllables, and interpersonal agreement. In addition, a semantic differential was administered to obtain an indication of meaning intensity. Although the

classical coding measures correlated with each other in expected directions for both groups, intensity of meaning was inversely correlated with the coding measures only for the monolingual group. For the bilinguals, intensity was directly related to the coding measures. Results imply that although coding measures do hold up between groups, they may mean different things. Words that have intense meaning for bilinguals may be those that elicit a host of associations, while for monolinguals, the most semantically intense words elicit few associations.—*Journal abstract*.

493. Shands, Harley C. (Columbia U, Coll of Physicians & Surgeons) **Grasping the nettle: Reflections on psychiatry and communication.** *Communication*, 1974, Vol 1(1), 99-118. Describes a theory of the paradoxical nature of the human condition and traces this theory to its deep structural origins in the programmatic implications of linguistic structure. This theory argues that human thinking, constrained by language, cannot now or ever be other than ambiguous and paradoxical since the deepest deep structure implicit in linguistic structure is the notion of dichotomy, particularly, of opposition. Only by confronting and grasping this human condition can human programming.—S. T. Margulis.

495. Béreaud, Susan R. **Sex role images in French children's books.** *Journal of Marriage & the Family*, 1975(Feb), Vol 37(1), 194-207.—Reports that an examination of French picture books for preschoolers reveals a strong male bias in the numerical representation of the sexes and strict sex role stereotyping of characters. Boys are shown coping with their environment, girls learning good behavior. Surprisingly, female status is lower in the more modern of 2 series studied.

496. Blasi, Augusto. (Boston U) **On becoming responsible: Orestes in Aeschylus and in Sartre.** *Review of Existential Psychology & Psychiatry*, 1974, Vol 13(1), 70-87.—Discusses the integrating nature of a developmental transition. The central role of responsibility in personality development, and the impossibility of understanding its nature without using ego psychology, are noted.

497. Bukala, C. R. (John Carroll U) **Sartre's "Kean": The drama of consciousness.** *Review of Existential Psychology & Psychiatry*, 1974, Vol 13(1), 57-69.—Considers the meaning of consciousness through its implications in the person of the actor E. Kean. Topics considered include the meaning of dramatic philosophy, the meaning of consciousness, and the consciousness of meaning.

498. Chabot, C. Barry. (American U) **The "melancholy dualism" of Robert Frost.** *Review of Existential Psychology & Psychiatry*, 1974, Vol 13(1), 42-56.—Suggests a psychological interpretation of Frost's use of the wilderness theme, stressing conflicts between people rather than between people and nature. An individual's

movement backward, against eventual death, is described as a way to achieve identity.

499. **Derrick, T.** (U Bradford, School of Education, England) **A review of three journals for 1968-70.** *Educational Research*, 1974(Nov), Vol 17(1), 62-65. —Reviews the characteristics of journal articles published in *British Journal of Educational Psychology*, *British Journal of Sociology*, and *International Review of Applied Psychology* from 1968-1970. Considerable differences are noted in the types of articles included; e.g., age groups studied, sample size, and methodology. Relatively few contributions by British authors were published.

500. **Linde, Lena.** (U Stockholm, Psychological Lab, Sweden) **Perception of poetic rhythm: A dimension analysis.** *Scandinavian Journal of Psychology*, 1975, Vol 16(2), 167-176. —Investigated the dimensionality in perceived qualities of poetic rhythm. 28 excerpts from Swedish poetry, including metric and free verse, were rated during silent reading by 60 undergraduates, using 36 semantic scales. The rated aspects were selected from a large pool of adjectives on the basis of results from 2 prestudies concerning semantic similarity between the adjectives and pertinence as descriptions of poetic rhythm. The aspects found to be most pertinent were selected from obtained clusters of semantically similar adjectives. Correlations were computed between aspects, the individual ratings being averaged for each excerpt. The correlation matrix was subjected to principal component analysis, which seemed to justify the interpretation of 4 dimensions. The 1st 2 components, interpreted as dimensions of rhythm in a strict sense, were labeled *regularity vs variation* and *melody vs lack of melody*, respectively. The 3rd component was named *emphasis vs lack of emphasis* and the 4th *calmness vs agility*. (26 ref)—*Journal abstract*.

501. **Madison, John P.** (U Illinois, Urbana-Champaign) **An analysis of values and social action in multi-racial children's literature.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 516.

502. **Wetzel, Frank J.** (Cornell U) **Psychology and the utopian individual in three novellas by Robert Musil: "Die Vollendung Einer Liebe," "Tonka," and "Die Amsel."** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1300.

504. **Woodie, Gary.** (San Diego State U) **Erostrate: Sartre's paranoid.** *Review of Existential Psychology & Psychiatry*, 1974, Vol 13(1), 30-41. —Presents a psychological analysis of J.-P. Sartre's *Erostrate*. The protagonist is described as paranoid with a basic sexual inadequacy.

DEVELOPMENTAL PSYCHOLOGY

505. **Aleksandrowicz, Malca K. & Aleksandrowicz, Dov R.** (Topeka Public Schools, KS) **The molding of personality: A newborn's innate characteristics in interaction with parents' personalities.** *Child Psychiatry & Human Development*, 1975(Sum), Vol 5(4), 231-241.

—Describes a girl who was studied by means of the Brazelton Behavioral Assessment Scale (a) from her 1st until her 28th day of life, (b) at the age of 1 yr, and (c) at the age of 1½ yrs. The examinational data and history (obtained from the parents) showed that the S had deviant development with exceptionally low orientation responsiveness and high excitability from the 1st hrs of life. The case illustrates the interaction between innate characteristics and parental attitudes (with special emphasis on the role played by the child's father) and the need for preventive counseling based on understanding a child's idiosyncratic behavior patterns. (28 ref)—*E. S. Goodman*.

506. **Bench, John & Wilson, Ian.** (Royal Berkshire Hosp, Audiology Unit, Reading, England) **A comparison of live and videorecord viewing of infant behavior under sound stimulation: II. Six-week-old infants.** *Developmental Psychobiology*, 1975(Jul), Vol 8(4), 347-353. —Presented 10 clinically normal 6-wk old infants with a series of sound stimuli while their behavior was assessed live by 2 sound-masked experienced observers and simultaneously videorecorded. 2 wks later the same observers assessed the behavior from the videorecords. In both situations, observers were permitted to see the Ss for 10 sec at each trial. The 1st 5 sec was a prestimulus observation period, and the 2nd 5 sec might have contained a sound stimulus. Between trials the observers were allowed 20 sec in which to note (a) prestimulus activity; (b) confidence confidence in response; and (c) facial, digit, and limb movements and "wholistic" impressions (e.g., "stilling"). The agreement between the live and video situations was fair for prestimulus activity, modest for confidence in response, and fair to good for movement items. The use of videorecorded material for 6-wk old infants generally caused rather small losses of relevant information and apparently will not overly distort the findings of experimental or clinical work. This outcome was similar to that of the authors' earlier study of neonates (see PA, Vol 53:4842).—*Journal abstract*.

508. **Cheal, Marylou.** (U Michigan, Dental School) **Social olfaction: A review of the ontogeny of olfactory influences on vertebrate behavior.** *Behavioral Biology*, 1975(Sep), Vol 15(1), 1-25. —Presents a review of the postnatal development of behavior involving olfaction, including investigations of olfactory responses of human neonates and young children, the development of preferences in various mammals, the ontogeny of the fright reaction in fish and amphibia, and the attraction of maternal odors for small mammals. (5½ p ref)

509. **Doyle, Anna-Beth.** (Concordia U, Montreal, Canada) **Infant development in day care.** *Developmental Psychology*, 1975(Sep), Vol 11(5), 655-656. —Results from a study of 5-30 mo old day-care and home-care children matched age, N sex, and home background indicate that children experiencing high quality group day care differed little from home-reared children.

510. **Greer, R. Douglas; Dorow, Laura G. & Randall, Andrew.** (Teachers Coll, Columbia U) **Music listening preferences of elementary school children.** *Journal of*

Research in Music Education, 1974(Win), Vol 22(4), 284-291.—134 Ss, randomly selected from nursery school and Grades 1-6 in 3 metropolitan middle-low income schools, were presented with an episodic reinforcement device which allowed them to choose to listen to one of alternate types of music and change their choice at will; the device recorded the Ss' listening time to each category. Results indicate an equal preference for rock and nonrock music with nursery school students and 1st graders, but from the 2nd to the 6th grade, rock music was preferred. (19 ref)—*D. S. Higbee*.

511. **Grossman, Melvyn L.** (Erich Lindemann Mental Health Ctr, Boston, MA) **Early child development in the context of mothering experiences.** *Child Psychiatry & Human Development*, 1975 (Sum), Vol 5(4), 216-223.—Describes selected critical periods in early human development in the context of the child's coping responses to the environment and the nature of the nurturing experience. Areas of development examined include neuromuscular, perceptual, cognitive, and psychosocial. Different kinds of mothering experiences are discussed, including the maternal deprivation syndrome and relative emotional deprivation. Studies of the effects of these areas on the development of the young child are also examined. (29 ref)—*E. S. Goodman*.

512. **Hall, William S.; Reder, Stephen & Cole, Michael.** (Rockefeller U, New York, NY) **Story recall in young Black and White children: Effects of racial group membership, race of experimenter, and dialect.** *Developmental Psychology*, 1975(Sep), Vol 11(5), 628-634.—Tested the effects of racial group membership, race of E, and dialect on unstructured and probed recall. 16 Black and 16 White 4-6 mo old children were Ss. Subgroups of 4 Ss within each racial group were randomly assigned to the experimental conditions such that order of exposure to E (Black and White) and dialects Standard English vs Black English vernacular were counterbalanced. Results show that Whites performed better than Blacks in Standard English, Blacks performed better than Whites in Black English vernacular, Blacks tested in Black English vernacular were equivalent to Whites tested in Standard English, and Whites performed better in Standard English than in Black English vernacular. When probed with questions, there was an overall increase in the proportion of correct information for both racial groups. (15 ref)—*Journal abstract*.

513. **Marcoen, Alfons.** (Psychologisch Inst, Louvain, Belgium) **The formal model of ontogenesis according to C. G. Jung.** (Duth) *Psychologica Belgica*, 1975, Vol 15(1), 35-61.—Models are used in developmental psychology to conceptualize the content, the form, and the dynamics of the human life. The formal model used by Jung is explained against the background of a synthetic scheme of stages of the life span. The model is based on the principles of polarization and enantiodromia which only help Jung to understand the essential features and the meaning of the midlife crisis. The model itself is a stage- a periodicity-, and an upbuilding demolition (expansion restriction) model. Critical reflections on the 3 dimensions of the model reveal that it has only partial usefulness for the understanding of the development of the whole human personality between birth and death. Research is suggested, especially in relation to periodical

and rhythmical phenomena in the developmental process. (40 ref)—*English abstract*.

514. **Müller, E.; Hollien, H & Murry, T.** (U Florida, Communication Sciences Lab) **Perceptual responses to infant crying: Identification of cry types.** *Journal of Child Language*, 1974(May), Vol 1(1), 89-95.—Conducted a study on the ability of mothers to perceptually differentiate cry samples elicited by 3 different stimulus situations. Ss were 4 male and 4 female 3-5 mo olds. In some instances mothers were evaluating cries produced by their own infant; in other cases they judged those produced by infants with whom they were unfamiliar. Results indicate that the 18 mothers were generally unable to successfully match the cry samples with the 3 cry-evoking situations. Further, no differential advantage was found when mothers were judging samples produced by their own infant.—*Journal abstract*.

515. **Nyström, Mats.** **Neonatal facial-postural patterning during sleep. II. Activity and states.** *Psychological Research Bulletin, Lund U*, 1975, Vol 15(1), 11 p.—Obtained significant inter-observer reliability for the level of phasic behaviors during sleep as well as for the occurrence of 2 tonic indices, eye movements, and irregular respiration. The proposed definition of the 2 states of infant sleep was based on cyclic variation of the phasic activity around its mean value. Recording of 32 infants aged 3-5 days yielded mean durations of approximately 20 and 40 min for the inactive and active states, respectively. Phi-correlations between active periods as thus assessed and the presence of the 2 tonic indices were very significant for most Ss. It is argued that recording of overt activity gives as coherent a delineation of infant sleep as do common physiological measurements.—*Journal abstract*.

516. **Ortendahl, Monica.** **The relationship between age and delay behavior.** *Göteborg Psychological Reports*, 1975, Vol 5(3), 17 p.—Compared 3 age groups as to delay processes. Ss rated offers to buy lottery tickets of which the probability, value, and time of outcome varied. Ss were male and female: 70 5-6 yr olds, 74 9-10 yr olds, and 73 adults. Tests were made of a multiplicative model in log form and an additive model in raw form. The 1st model tended to fit better than the 2nd in all age groups, being somewhat better for groups of adults and, to some extent, of girls 5-6 yrs old than for the other age groups concerned. The exponents of probability, value, and time exhibited large interindividual variation.—*Journal abstract*.

517. **Pederson, David R.** (U Western Ontario, London, Canada) **The soothing effect of rocking as determined by the direction and frequency of movement.** *Canadian Journal of Behavioural Science*, 1975(Jul), Vol 7(3), 237-243.—Recent research has revealed that rocking is a potent soother of infant distress, the effectiveness of which is a direct function of frequency and amplitude. The present 2 experiments with a total of 112 2-mo-old infants were conducted because previous studies have not examined the influence of direction per se. In Exp 1, Ss were rocked in an up-and-down, side-to-side, or head-to-toe direction at 45 or 60 cycles/min. The direction of rocking was not significantly related to changes in activity. Rocking at 60 cycles/min resulted in a greater reduction in activity than rocking at 45 cycles/min. In

Exp II, the influence of up-and-down and head-to-toe movement at 45 cycles/min was compared using a within-Ss rather than a between-Ss design. Again, the effects of rocking were not related to the direction of movement. (French summary) (18 ref)—*Journal abstract*.

519. Wagner, Hilmar. (U Texas, El Paso) **The impact of military service on the male adolescent.** *Adolescence*, 1975(Spring), Vol 10(37), 71-74.—Maintains that in military service, the adolescent can find a new and broader perspective on the world. Educational and vocational opportunities are now numerous. For some it can provide a smooth transition from childhood to adulthood.

Cognitive & Perceptual Development

520. Achenbach, Thomas M. (NIMH, Child Research Branch, Bethesda, MD) **A longitudinal study of relations between associative responding, IQ changes, and school performance from grades 3 to 12.** *Developmental Psychology*, 1975(Sep), Vol 11(5), 653-654.—Presents results of a study to test the hypothesis that the school performance and IQs of associative responders would show a significant long-term divergence from those of nonassociative responders. Samples were comprised of Ss who had been tested in Grades 5 or 6 and for whom school records were available in Grade 11 or 12. Findings revealing a long-term divergence are reported.

521. Arlin, Patricia K. (U British Columbia, Faculty of Education, Vancouver, Canada) **Cognitive development in adulthood: A fifth stage?** *Developmental Psychology*, 1975(Sep), Vol 11(5), 602-606.—Notes that recent investigation of the Piagetian stage of formal operations suggest that consistent, progressive changes in thought structures may extend beyond the level of formal operations. The present study, employing 60 female college seniors as Ss, systematically searched for new structures. It suggests a new stage to account for these structures and offers empirical evidence to support the hypothesized 5th stage. 2 formal stages are defined operationally: the problem-solving stage (traditional Piagetian formal operations stage) and the *problem-finding* stage. The commonly accepted criteria for a stage model are applied to justify the 2-stage hypothesis. Particular emphasis is placed on the sequencing criterion and on evidence that the problem-solving stage is the necessary but not sufficient condition for the problem-finding stage. Discussion centers on the theoretical and empirical importance of considering the 2-stage hypothesis, and further research questions are suggested. (16 ref)—*Journal abstract*.

522. Baron, Jonathan; Lawson, Glen & Siegel, Linda S. (U Pennsylvania) **Effects of training and set size on children's judgments of number and length.** *Developmental Psychology*, 1975(Sep), Vol 11(5), 583-588.

When children are asked to compare 2 rows of dots in length or number, some respond consistently as if they were asked about number (i.e., with a number strategy) and some as if about length, regardless of what they are asked in fact. If such children are then trained to respond correctly to the kind of question on which they had made errors, they still do not differentiate the dimensions but

instead make errors on the kind of question they had previously answered correctly. The choice of dimensional strategy is also determined by the number of dots in the sets and whether the session began with large or small sets. Findings from a study of 84 3-5yr olds are interpreted with reference to the distinction between having a strategy and attaching it to appropriate situations; apparently these strategies are applied out of bias rather than attachment.—*Journal abstract*.

523. Case, Robbie. (U California, Berkeley) **Social class differences in intellectual development: A Neo-Piagetian investigation.** *Canadian Journal of Behavioural Science*, 1975(Jul), Vol 7(3), 244-261.—According to a recently developed neo-Piagetian theory by J. Pascual-Leone (1969), performance on Piagetian tasks depends on 4 distinct factors: (a) the S's repertoire of task-related schemes, (b) the S's repertoire of general executive schemes, (c) the S's mental space (a maturational variable which determines the maximum number of schemes he can coordinate simultaneously), and (d) the S's degree of field independence. The present article describes 3 studies with a total of 217 upper- and lower-class 6-12 yr olds which suggest that significant social class differences exist only with regard to the 1st 2 factors. The relevance of the data for both information processing and Piagetian views of social class differences is discussed, and a neo-Piagetian interpretation of A. R. Jensen's Level I-Level II distinction is advanced. (French summary) (38 ref)—*Journal abstract*.

524. Chen, Shoo-may. [A study on the relationship between the socioeconomic level and preschool children's ability to imitate and to comprehend speech.] (Chin) *Bulletin of Educational Psychology*, 1973(Jun), Vol 6, 113-120.—Designed speech imitation and comprehension tasks to test the Ss' abilities to comprehend 10 syntactic structures. Ss were 32 kindergartners equally divided by socioeconomic level and by sex. Results suggest that (a) the performances of children from higher socioeconomic levels are significantly superior to those of children from lower levels; (b) there were no significant differences between the performances of boys and girls; (c) significant relationships were noted between the variable sets of intelligence level and speech comprehension, intelligence level and speech imitation, and speech comprehension and speech imitation.—*English abstract*.

525. Desor, J. A.; Maller, Owen & Andrews, Kathryn. (U Pennsylvania Monell Chemical Senses Ctr) **Ingestive responses of human newborns to salty, sour, and bitter stimuli.** *Journal of Comparative & Physiological Psychology*, 1975(Oct), Vol 89(8), 966-970.—In 2 experiments a total of 204 16-90 hr old neonates were offered 2 fluids differing in taste for 3 min each. The volumes ingested were measured. Ss offered water and bitter and sour solutions did not ingest them differentially, which corroborated earlier observations with weaker solutions. A sucrose solution was used to find baseline ingestion above that of water. Ss offered the sucrose solution with and without urea, citric acid, or sodium chloride consumed less of it when citric acid was added. They were indifferent to the addition of urea or sodium chloride. The failure to show any taste response to urea or of water suggests that newborns may not be able to taste

ingestion of water. The effect of sex, age, birth weight, and individual consistency on intake were assessed.—*Journal abstract.*

526. Donaldson, Margaret & McGarrigle, James. (U Edinburgh, Scotland) **Some clues to the nature of semantic development.** *Journal of Child Language*, 1974(Nov), Vol 1(2), 185-194.—Reports studies of comprehension of the quantifiers *all* and *more*. Ss were 40 3-5 yr olds subjected to 2 main conditions. In 1 of these the objects to which the quantifiers related were enclosed in containers which either were or were not filled by the objects. In the other no containers were present. Conditions yielded substantially different response patterns. The relation of the findings to those typically obtained from Piagetian conservation tasks is discussed, and implications for theories of semantic development are considered.—*Journal abstract.*

527. Dusek, Jerome B.; Kermis, Marguerite D. & Mergler, Nancy L. (Syracuse U) **Information processing in low- and high-test-anxious children as a function of grade level and verbal labeling.** *Developmental Psychology*, 1975(Sep), Vol 11(5), 651-652.—Reports results of an investigation of 2nd, 4th, and 6th graders under either game or test conditions. Several implications of attentional theories of test anxiety are reported.

528. Fodor, J. A.; Garrett, M. F. & Brill, S. L. (Massachusetts Inst of Technology) **Pi ka pu: The perception of speech sounds by prelinguistic infants.** *Perception & Psychophysics*, 1975(Aug), Vol 18(2), 74-78.—Conducted experiments with 36 14-18 wk old infants to determine whether they, like adults, respect the existence of internal syllabic structure. Findings show that the Ss were capable of grouping together syllables of English depending on whether the syllables shared a consonant. These results indicate that infants may have access to the mechanisms that underlie certain perceptual constancies in adult speech perception. *Journal abstract.*

529. Fox, Barbara & Routh, Donald K. (U North Carolina, Chapel Hill) **Analysing spoken language into words, syllables, and phonemes: A developmental study.** *Journal of Psycholinguistic Research*, 1975(Oct), Vol 4(4), 331-342.—Asked 50 3-7 yr olds to repeat spoken sentences and then to divide up these sentences into words, the words into syllables, and the syllables into speech sounds. There was a clear developmental progression in the ability to analyze spoken language in this way. The skills of analyzing sentences into words and words into syllables were highly related. Items requiring analysis into phonemes were highly correlated with each other and somewhat independent of sentence and word analysis items. Results are related to E. J. Gibson's (1968) model of reading, in which the acquisition of grapheme-phoneme correspondences is a crucial process. (21 ref)—*Journal abstract.*

530. Frith, Uta & Robson, Jocelyn E. (MRC Developmental Psychology Unit London, England) **Perceiving the language of films.** *Perception*, 1975, Vol 4(1), 97-103.—Conducted an experiment in which a simple action sequence filmed from a static viewpoint was made up into 2 films of 4 shots. One film was edited according to the rules of directional continuity specified by Hollywood cinema (i.e. the 4 shots were presented so as to

preserve the S's direction of movement across cuts). The other film was edited disregarding these rules. Apart from this difference both films were identical. 60 7-, 9-, and 13-yr-olds watched either of these films and reconstructed the action using pictures representing the 4 shots. The Ss who saw the conventional version were better able to reconstruct what they had seen than those who saw the unconventional version.—*Journal abstract.*

531. Gardner, Beatrice T. & Gardner, R. Allen. (U Nevada, Reno) **Evidence for sentence constituents in the early utterances of child and chimpanzee.** *Journal of Experimental Psychology: General*, 1975(Sep), Vol 104(3), 244-267.—Within 51 mo of her arrival in the laboratory the chimpanzee Washoe had acquired 132 signs of Ameslan (American Sign Language) that met criteria of expressive use (as contrasted with the much larger number of signs in her receptive vocabulary). This vocabulary together with the criteria is described here. To study Washoe's use of vocabulary items as sentence constituents, a test based on R. Brown's (see PA, Vol 43:2421) analysis of replies to "Wh" questions by young children was devised. Because Washoe was maintained under similar conditions, her replies to questions were very similar to the replies of children. In the present investigation, 10 question frames that were typical of the questions asked of Washoe every day were selected. During the 50th and 51st mo of Project Washoe, each of these 10 question frames was used to construct 50 "Wh" questions, varying in text and context. In terms of providing the sentence constituents specified by the different "Wh" questions, Washoe's replies were superior to the replies that have been reported as typical of human children at Brown's Stage III.—*Author abstract.*

532. Henriques-Christofides, Andrula & Moreau, Alain. (U Genève, Inst de Sciences de l'Education, Switzerland) **[Some new data on combinatory operations and formal thinking.]** (Fren) *Cahiers de Psychologie*, 1974, Vol 17(1), 55-64.—Reexamines the conclusion of Piaget and his collaborators that formal thinking in children begins only toward the ages of 11-12 yrs. In his studies, Piaget uses secondary factors to explain that the ability of Ss to perform systematic combination operations does not appear in younger children. The Piaget studies were not restricted to combinations but involved other and more complex analyses. The test procedure failed to assure that the Ss had a clear idea of what they were being asked to do. The data obtained reflected only initial reactions, not optimal performance. In the current study, the Piaget experiments with colored counters were repeated with instructions and procedures remodeled to overcome these sources of poor performance. 10 Ss in each of 5 age groups (5-6, 7, 8, 9, and 10-11 yrs) were tested. The E first made sure that the initial instructions were understood. At succeeding stages, the E elaborated on the requirements, adapting the explanations to what the S had already accomplished. As early as 7 yrs, Ss succeeded in forming 2-element arrangements and in moving arrangements to combinations and vice versa. (English summary)—*E. E. Brown.*

533. Holmberg, Lennart. **The influence of elongation on the perception of volume of geometrically simple objects.** *Psychological Research Bulletin, Lund U*, 1975, Vol 15(2), 18 p. The volume and the heaviness of

objects of equal volume and weight but of varying height-width ratios were estimated by 7 children in each of Grades 1, 2, 3, 5, 7, and 9 as well as by a group of 7 undergraduates. Oblong objects were rated as both greater in volume and heavier than more compact ones.

This finding is inconsistent with the size-weight illusion, according to which perceived size and heaviness are inversely related. This is interpreted to mean that the volume estimations resulted from 2 processes, a primary one, intuitive and immediate, governed mainly by the objective volume, and a secondary one, rational and sensitive to individual and situational factors but not susceptible to sensory cross-modal interactions. The same kinds of processes are assumed to be involved in weight estimations.—*Journal abstract.*

534. Keenan, Elinor O. (U Cambridge, England) **Conversational competence in children.** *Journal of Child Language*, 1974(Nov), Vol 1(2), 163-183.—Reports that observations of early morning conversations between 2.9-yr-old male twins indicate that young children are able to sustain a coherent dialogue over a number of turns. It is concluded that, contrary to the views of Piaget (1926), the interlocutors generally attend to one another's utterances. (26 ref)

535. Kurdek, Lawrence A. & Rodgon, Maris M. (U Illinois, Chicago Circle) **Perceptual, cognitive, and affective perspective taking in kindergarten through sixth-grade children.** *Developmental Psychology*, 1975(Sep), Vol 11(5), 643-650.—Investigated the development of perceptual, cognitive, and affective perspective taking in 167 kindergarten through Grade 6 Ss. Perceptual perspective taking increased in the 4th- through 6th-grade period; cognitive perspective taking increased between both Grades 2 and 3 and Grades 4 and 5; affective perspective taking in situations minimizing the likelihood that the child would project his own affective response to a story character decreased with grade level. Males were found to be better perceptual and affective perspective takers than were females. In general, task intercorrelations were low, nonsignificant, and inconsistent, supporting the view that perspective taking is a multidimensional social cognitive construct. (25 ref) —*Journal abstract.*

536. Leonard, Laurence B. (Memphis State U) **On differentiating syntactic and semantic features in emerging grammars: Evidence from empty form usage.** *Journal of Psycholinguistic Research*, 1975(Oct), Vol 4(4), 357-364.—Notes that recent emphasis on underlying semantic relations in the child's acquisition of grammar has ignored those cases where syntactic operations can be observed relatively independent of semantic relations. It is suggested that such operations may reveal optional processes in the child's transition from single-word utterances to grammatical usage that may be related to specific linguistic rather than general cognitive abilities. —*Journal abstract.*

537. Lessor, Harvey & Drouin, Carol. (Rutgers State U) **Training in the use of double-function terms.** *Journal of Psycholinguistic Research*, 1975(Oct), Vol 4(4), 285-302. A total of 20 1st-, 2nd-, and 3rd-grade children were tested, trained, and retested in their use of double-function words (e.g., *hard*, *deep*, and *bright*) Ss first understood such words as they referred to inanimate

objects, than to people in a physical sense, and last to people in a psychological sense. Wide variations in initial understanding and trainability of double-function words occurred. It was easier to train Ss to understand a double-function word as applied to a person in a physical sense than in a psychological sense. Words with tactual referents and *hard* were warm, dry, cold, and hard) were understood earlier than words with visual referents (*bright*, *crooked*, *sharp*, and *deep*), but words with visual referents showed greater gains after training. Several possible explanations of these results are discussed.—*Journal abstract.*

538. Longhurst, Thomas M. & Reichle, Joe E. (Kansas State U) **The applied communication game: A comment on Muma's "Communication Game: Dump and play."** *Journal of Speech and Hearing Disorders*, 1975(Aug), Vol 40(3), 315-319.—Discusses the clinical relevance of J. Muma's article (see PA, Vol 55:Issue 1) on communication processes. It is concluded that, since the technology is available to teach speech and language skills to children, a technology should be developed for teaching interpersonal communication skills. An applied communication "game" for children is described.

539. Marshall, Lynne; Brandt, John F. & Marston, Larry E. (U Kansas) **Anticipatory middle-ear reflex activity from noisy toys.** *Journal of Speech and Hearing Disorders*, 1975(Aug), Vol 40(3), 320-326.—Measured middle-ear reflex activity in 13 young adults and 1 5-yr-old in response to visual and acoustic exposure to each of 7 noisy toys (e.g., a cap gun, party horn, and cow bell). Anticipatory middle-ear reflex (AMER) activity was a common occurrence. Normal middle-ear reflex generally occurred after the sound exposure. AMERs generally occurred in the 2 sec prior to sound exposure but as early as 10 sec before the sound exposure. Loudness ratings and exposure sound pressure levels (SPLs) were obtained. The presence of acoustically evoked middle-ear reflex activity and AMERs to the toys was generally unrelated to SPL or reflex threshold. Many reflex responses occurred in response to exposure SPLs below reflex threshold and with low anticipated loudness rating.—*Journal abstract.*

540. Miklich, D. R. & Gillis, J. S. **Interaction of age and cue validities in multiple-cue probability learning by children.** *Psychological Reports*, 1975(Aug), Vol 37(1), 235-240.—Reports 2 studies which tested the hypothesis that in comparison with older children (early teens) younger children (ages 8-9) would learn multiple-cue probability tasks with equal cue-criterion validities relatively better than tasks with multiple cues and a single cue of high validity. In Study 1, Ss were 39 children assigned to 3 groups with mean ages of 8.6, 11, and 13.9 yrs. In Study 2, 31 Ss (mean ages 8.1 and 14.3 yrs) were used. The predicted interaction was found in both studies but the pattern differed. This difference was probably due to the variations of the tasks used in the studies. While the age-cue validity interaction is plausible, further research will be required to determine its precise relevance for developmental theory.—*Journal abstract.*

541. Muma, John R. (State U New York, Buffalo) **The communication game: Dump and play.** *Journal of Speech and Hearing Disorders*, 1975(Aug), Vol 40(3), 296-309.

—A review of the literature suggests that communication entails much more than formulating a linguistic code to map underlying intents. It entails the utilization of a role-taking attitude in reconciling communicative obstacles that arise from significant speaker-listener discrepancies in form or code, reference or representation, and license or acceptability. Young children communicate in a "talk to" fashion that essentially is issuing or dumping messages. As role-taking attitudes become acquired, communicative efforts change from merely dumping messages to active resolution of communicative obstacles in an effort to achieve the message of best fit for a particular situation. (3 p ref)—*Journal abstract*.

542. Munsinger, Harry. (U California, San Diego) **The adopted child's IQ: A critical review.** *Psychological Bulletin*, 1975(Sep), Vol 82(5), 623-659.—Summarizes all reliable published data about the nature and nurture of adopted children's IQs, and draws conclusions about the relative importance of heredity and environment on children's mental development. Any study that compares the central tendency of adopted children's IQs with a group mean of 100 IQ points for a normal population cannot be taken seriously until several methodological criteria have been met: (a) representative sampling, (b) no differential loss of Ss over time, (c) accurate, age-corrected information on biological and adoptive parents, (d) careful attention to early separation and placement of children, and (e) elimination of practice effects and regression to the mean artifacts. Analysis of the resemblance between individual adopted children's IQ scores and their adoptive and biological parents' mental abilities shows that the adoptive parents' home environment has only a modest effect on their adopted children's intellectual growth, while heredity and environment of the biological parents have a strong effect on their own children's intellectual growth. At present there is disagreement about the precise values of genetic and environmental effects on IQ, and several assumptions must be made before accurate statistics can be derived. But, the available data strongly suggest that under existing circumstances, heredity is much more important than environment in producing individual differences in IQ. (39 ref)—*Journal abstract*.

543. Rees, Norma S. (Graduate School & University Ctr. City U. New York) **Imitation and language development: Issues and clinical implications.** *Journal of Speech and Hearing Disorders*, 1975(Aug), Vol 40(3), 339-350.

Notes that the relationship between imitation and language learning is of both theoretical and clinical interest. A review of the literature is presented which suggests that while current psycholinguistic accounts give imitation only a limited role in language learning, learning theorists and others continue to refer to imitation as a major factor in the child's acquisition of language. Clinicians deal with imitation in modeling procedures as well as in counseling parents about how to promote children's language development. Studies on nature and development of imitation reveal wide variation in terminology, definitions, and explanations. The clinical use of imitation procedures have greater significance for the acquisition skills than for the development of linguistic structure. (1 p ref) *Journal abstract*.

545. Shewan, Cynthia M. (U Western Ontario, Program in Communicative Disorders, London, Canada) **The language-disordered child in relation to Muma's "Communication game: Dump and play."** *Journal of Speech and Hearing Disorders*, 1975(Aug), Vol 40(3), 310-314.—Discusses the clinical relevance of an article by J. Muma (see PA, Vol 55: Issue 1), which argues that, since the operations in the communication game are influenced by ethnic and cultural variables, a clinician must consider these in language training in order to facilitate communication in language-disordered children.

546. Tsuji, Keiichi & Ide, Yoko. (Nagoya U, Japan) **Development of bilateral transfer of skills in the mirror-tracing.** *Japanese Psychological Research*, 1974(Dec), Vol 16(4), 171-178.—Examined bilateral transfer effect in a mirror-tracing task for 7 age groups (mean ages 8, 10, 12, 14, 17, 21, and 32 yrs); each age group contained 20 Ss. A group of Ss was tested twice with the nonpreferred hand and was divided into matched groups according to the averaged time score. Ss were tested again with the nonpreferred hand for 6 trials—after 16 trials with the preferred hand in the experimental group and after a 15-min rest in the control group, respectively. Performance of the preferred hand initially differed among age groups, but the difference disappeared as the trials proceeded. In a comparison of learning curves of the nonpreferred hand between experimental and control groups, it was clearly shown that the gain of performance was remarkable between the 2nd and the 3rd trials in the experimental group. Thus, the bilateral transfer effect was demonstrated for all of the 7 age groups. The amount of positive transfer was 50% in the 8-yr-old group and was reduced to 20% in the 12- and 14-yr-old groups, keeping a constant level of 25% thereafter.—*Journal abstract*.

547. Walker, William W. (U Nebraska, Lincoln) **An empirical study of concept attainment.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 180.

548. Watrous, Betty S.; McConnell, Freeman; Sitton, Ann B. & Fleet, William F. (U New Mexico) **Auditory responses of infants.** *Journal of Speech & Hearing Disorders*, 1975(Aug), Vol 40(3), 357-366.—40 3-12 mo olds participated in a study designed to differentiate the auditory response characteristics of normally developing infants in the age ranges 3-5, 6-8, and 9-12 mo. Their selection was based on a determination of normal development upon pediatric examination and from the results of the Denver Developmental Screening Test. Results show that a predictable developmental pattern as a function of age in the 1st yr of life is observable despite the wide variability that may occur in a given child. Increased knowledge of these developmental milestones in normal-hearing infants should add to more effective programs of early identification and management of hearing-impaired children.—*Journal abstract*.

Psychosocial & Personality Development

549. Barnett, Mark A. (Kansas State U) **Effects of competition and relative deservedness of the other's fate on children's generosity.** *Developmental Psychology*, 1975(Sep), Vol 11(5), 665-666.—Data from a study with 96 male 4th and 5th graders support the notion that the child's sense of the relative deservedness of the potential recipients' fate influences his inclination to respond charitably. Ss were more charitable to children whose unfortunate plight was determined by chance than to children who lost in a competition.
550. Bush, Ellen S. & Dweck, Carol S. (U Illinois, Urbana-Champaign) **Reflections on conceptual tempo: Relationship between cognitive style and performance as a function of task characteristics.** *Developmental Psychology*, 1975(Sep), Vol 11(5), 567-574.—Reflectives have been shown to outperform impulsives on tasks that require a cautious, systematic approach. A study was conducted to determine whether reflectives, particularly high-anxious reflectives, would show superior performance on speeded tasks; i.e., whether they would exhibit flexibility vs continued caution at the expense of performance. 46 male and 54 female 4th graders, selected by their scores on the Test Anxiety Scale for Children and the Lie Scale for Children as being reflective and impulsive, high and low anxious, were presented with speeded tasks of increasing difficulty. Results reveal that contrary to prediction, high-anxious reflectives performed as well as low-anxious reflectives and both were generally faster and more accurate than impulsives. Only for girls on the most difficult task was there evidence that reflection in combination with high anxiety resulted in overly cautious behavior and impaired performance. Results suggest a definition of cognitive style that stresses the strategy used rather than the disposition for long or short decision times. In addition, a model is proposed to predict the relative speed and accuracy of reflectives and impulsives as a function of the strategy required and the degree of intertrial transfer on the task. (25 ref)—*Journal abstract*.
551. Campos, Joseph J.; Emde, Robert N.; Gaensbauer, Theodore & Henderson, Charlotte. (U Denver) **Cardiac and behavioral interrelationships in the reactions of infants to strangers.** *Developmental Psychology*, 1975(Sep), Vol 11(5), 589-601.—Recorded cardiac and various behavioral reactions of 80 5- and 9-mo-old infants to strangers to determine (a) whether the shift with age from attentiveness to fearfulness of strangers is accompanied by a shift from heart rate (HR) deceleration to acceleration; (b) whether testing infants in the presence of the mother attenuates cardiac and behavioral manifestations of stranger distress; and (c) whether the direction of HR change is related to the direction of change of facial expression, even when age is held constant. Results are generally positive. Behavioral data confirmed that most 5-mo-olds were not frightened by the stranger, and many but not all 9-mo-olds were. HR responses also changed with age, being predominantly deceleratory to the stranger at 5 mo of age and acceleratory at 9 mo. The accelerations were of much greater frequency and larger magnitude when 9-mo-olds were tested in the mother's absence. In contrast, behavioral reactions were not significantly affected by the mother's absence. The direction of HR responding was linked at both ages to affective expression: Whether 5 or 9 mo of age, behaviorally distressed Ss gave progressively acceleratory responses, whereas behaviorally undistressed Ss did not. It is concluded that future studies can profit from careful recording of both HR and behavioral expression in the infant. (21 ref)—*Journal abstract*.
552. Cantor, Gordon N. (U Iowa, Div of Educational Psychology, Measurement & Statistics) **Sex and race effects in the conformity behavior of upper-elementary school-aged children.** *Developmental Psychology*, 1975(Sep), Vol 11(5), 661-662.—Reports 2 experiments with a total of 368 Black and White lower- and middle-class 9-12 yr olds in which a novel technique was used to study sex and race effects on children's conformity behavior. Neither the White, lower-class Ss nor the White, middle-class Ss showed any consistent tendency to conform differentially to Black and White models. A tendency of Blacks in Exp 1 to conform more to White than to Black models constituted the only race effect of any consequence.
553. Chen, Shoo-may. [Interpersonal and intrapersonal inconsistent verbal instructions as related to children's resistance-to-temptation behavior.] (Chin) *Bulletin of Educational Psychology*, 1974(Jun), Vol 7, 63-75.—Examined the relationship between inconsistent verbal instruction and children's resistance-to-temptation behavior. Ss were 64 2nd graders randomly assigned to inter- and intrapersonal instruction groups. Each group was further divided into 4 subgroups: consistent prohibitive, inconsistent (permissive first), inconsistent (prohibitive first), and consistent permissive. Ss' toy-touching responses were analyzed by latency, frequency, duration, and average duration score. Results show that (a) there were no significant group differences in manipulative responses between the inter- and intrapersonal verbal instruction groups; (b) children in inconsistent instruction groups had more toy-touching responses and shorter latency than the consistent prohibitive group, but less toy-touching responses and longer latency than the consistent permissive group; and (c) there were no significant differences between the 2 inconsistent groups in terms of mean latency, frequency, duration score, and average duration score. (17 ref)—*Journal abstract*.
554. Cornelius, Steven W. & Denney, Nancy W. (Pennsylvania State U, Coll of Human Development) **Dependency in day-care and home-care children.** *Developmental Psychology*, 1975(Sep), Vol 11(5), 575-582.—Compared 32 4- and 5-year-old boys and girls who attended full-time group day care with 32 home-care matched Ss on proximity-seeking and attention-seeking measures of dependency. Ss were rated on these measures when they were alone with their mothers, with their mothers and a confederate adult, and with their mothers and a confederate child. No differences between day-care and home-care Ss were obtained. However, there was an interaction between type of care and sex: Although there was no difference between day-care boys and girls, home-care girls sought proximity toward their mothers significantly more often than home-care boys. Since dependency is one of the dimensions on which sex

differences are frequently found, results suggest that day-care children may be less sex typed than home-care children. (15 ref)—*Journal abstract*.

555. Donovan, James M. (Peter Bent Brigham Hosp. Boston, MA) **Identity status: Its relationship to Rorschach performance and to daily life patterns.** *Adolescence*, 1975(Spr), Vol 10(37), 29-44.—Investigated identity status in a study with 13 male and 9 female undergraduates who were administered the Identity Status Interview, Rorschach, TAT, and Early Memories Inventory and completed a log of the previous week's activities. The differences between Ss in 5 categories are discussed: diffusion, identity foreclosure, moratorium, moratorium diffusion, and identity achievement.—A. Kricher.

556. Etaugh, Claire & Rose, Suzanne. (Bradley U) **Adolescents' sex bias in the evaluation of performance.** *Developmental Psychology*, 1975(Sep), Vol 11(5), 663-664.—Examined 252 7th, 9th, and 11th graders' evaluations of articles differing in sex association of field (masculine, feminine, or neutral) and sex of author. Results show that sex bias in the evaluation of performance is well established in boys and girls by the early years of adolescence, particularly in the devaluation of female achievements.

557. Harris, Mary B. & Siebel, Claudia E. (Ohio State U) **Affect, aggression, and altruism.** *Developmental Psychology*, 1975(Sep), Vol 11(5), 623-627.—Investigated the effects of thinking happy, sad, or angry thoughts on both aggression and altruism in 39 male and 34 female 3rd graders in a 4 × 2 design with 3 affect manipulations and a control group. Girls shared more balloons than boys, but there were no treatment differences in altruism. Boys were more aggressive than girls, although the sexes did not differ in the control condition. Instead, boys in all 3 affect conditions were more aggressive than in the control condition, whereas girls in all 3 affect conditions were less aggressive than girls in the control condition. Results are consistent with a view that any kind of emotional arousal may serve to increase a dominant aggressive response in boys and lead to inhibition of aggression in girls.—*Journal abstract*.

558. Hewitt, Lynn S. (U Nijmegen, Netherlands) **Age and sex differences in the vocational aspirations of elementary school children.** *Journal of Social Psychology*, 1975(Aug), Vol 96(2), 173-177.—Asked 128 6- and 8-yr-old Dutch children about their vocational aspirations. It was hypothesized that (a) boys would aspire to a greater variety of vocations than girls, (b) boys would change their vocational preferences more frequently than girls, (c) older boys would aspire to a broader range of vocations than younger boys, and (d) older girls would aspire to a similar or smaller range of vocations than younger girls. All the hypotheses except (b) received support. Results suggest that sex-role expectations for adult occupations are acquired very early and, moreover, strongly circumscribe the range of vocations perceived as appropriate for females.—*Journal abstract*.

559. Hoffman, Martin L. (U Michigan) **Developmental synthesis of affect and cognition and its implications for altruistic motivation.** *Developmental Psychology*, 1975(Sep), Vol 11(5), 607-622.—Presents an argument, based on psychological research and inferences about

human evolution, for the plausibility of an intrinsic altruistic motive, following which a theoretical model for the development of such a motive is outlined. The central idea of the model is that a person's empathic response to another person's distress, interacting with his cognitive sense of the other person, provides the basis for a motive is outlined. The central idea of the model is that a person's empathic response to another person's distress, interacting with his cognitive sense of the other person, provides the basis for a motive independent of egoistic motivation to help the other person. Empathic distress and 3 steps in the development of a sense of the other are discussed, along with empirical evidence for the approximate ages at which they occur. A theoretical account of the interaction between these effective and cognitive processes is then presented, followed by an attempt to assess the evidence for the theory. (2½ p ref)—*Journal abstract*.

560. Hoornaert, Frans & Pierloot, Roland. (Dienst voor Psychopathologie, Louvain, Belgium) **[The paternal and maternal symbolic dimensions in parental images.]** (Duth) *Psychologica Belgica*, 1975, Vol 15(1), 11-27.—Administered the Semantic Differential Parental, a modification of Semantic Differential, to 117 males and females in 3 age group (18-30, 31-40, and 41-55 yrs) to determine the degree to which parental images can be viewed as a function of the maternal and paternal symbolic dimension. Results show that the maternal image on both wish-fulfillment and realistic levels was characterized by the maternal symbol dimension while paternal images were equally saturated with both paternal and maternal dimensions. Age and sex differences were found. On the realistic level, parental images were equally saturated in the paternal dimension whereas the maternal dimension discriminated between images.—*English abstract*.

561. Jackson, Dorothy W. (Ohio State U) **The meaning of dating from the role perspective of non-dating pre-adolescents.** *Adolescence*, 1975(Spr), Vol 10(37), 123-126.—319 nondating 11- and 12-yr-olds were asked what the word dating meant to them and to explain what is done when one goes out on a date. Ss' concepts tended to be imprecise and were generally unrelated to personal growth or social interaction.

562. Joesting, Joan & Joesting, Robert. (Salisbury State Coll) **Sex differences in equalitarianism and anxiety in ninth grade students.** *Adolescence*, 1975(Spr), Vol 10(37), 59-61.

563. Katz, Phyllis A.; Zigler, Edward & Zalk, Sue R. (Graduate School & University Ctr, City U New York) **Children's self-image disparity: The effects of age, maladjustment, and action-thought orientation.** *Developmental Psychology*, 1975(Sep), Vol 11(5), 546-550.—Assessed developmental and experiential determinants of self-image disparity in 80 children. 3 groups of male 5th and 8th graders were investigated: nonmaladjusted Ss, maladjusted Ss whose primary symptomatology was in the sphere of action, and maladjusted Ss whose symptoms were in the sphere of thought. No support was obtained for the Rogerian position that maladjustment per se was related to self-image disparity. Consistent with predictions generated by developmental theory, both age and the maladjusted Ss' position on the action-thought

continuum were predictive of the magnitude of self-image disparity. Emotionally disturbed Ss had more negative real-self images, and those with externalizing symptoms had lower ideal-self scores as well. Thus, children's self-images appear to be influenced by experiential factors as well as cognitive-developmental ones. (21 ref)—*Journal abstract.*

564. Kohlberg, Lawrence. (Harvard U) **The development of moral stages: Uses and abuses.** *Proceedings of the Invitational Conference on Testing Problems*, 1973, 1973, 1-8.—Discusses how L. Kohlberg's measure of moral judgment has been used as a vehicle for self-understanding by students. It is suggested that psychological tests should measure invariant stages of development in order to be applicable and valuable to all persons, regardless of culture and subculture.—H. E. Yunker.

565. Krane, Merton S. (Inst for Juvenile Research, Chicago, IL) **Schoolchildren's attitudes toward public authority figures.** *Adolescence*, 1975(Spr), Vol 10(37), 111-122.—474 6-8th graders responded to a questionnaire designed to evaluate their attitudes of duty, efficacy, and trust toward the President, mayor, policeman, and teacher. The level of efficacy and duty was highly correlated with trust and was dependent on the level of trust. (22 ref)—A. Krichew.

566. Lomranz, Jacob; Shapira, Ariela; Chores, Netta & Gilat, Yitzhak. (Tel-Aviv U, Israel) **Children's personal space as a function of age and sex.** *Developmental Psychology*, 1975(Sep), Vol 11(5), 541-545.—Gathered measures of personal space from 74 children (ages 3, 5, and 7) when they approached boys or girls of their own age. A significant difference was found between the 3-yr-olds (who kept less distance from their age peers) and the 5- or 7-yr-olds. No other differences attributable to age were found. For all Ss, the sex of the interacting child was relevant in that less distance was kept from girls than from boys. Results are discussed in the light of learning and developmental processes. (22 ref)—*Journal abstract.*

567. Loreto, D. & Tonoli, C. (Hosp Psichiatrico Provinciale, Provinciale, Como, Italy) **[The problem of adjustment during adolescence.]** (Ital) *Neuropsichiatria*, 1973(Jan-Jun), Vol 29(1-2), 65-80.—Reviews the characteristics of the adolescent period and its typical dynamics, such as ambivalence of affection and attitudes, pseudomaturity and marginality. A secondary school class of 29 female students, 14-15 yrs old, was surveyed with the Bell Adjustment Inventory and 2 sociometric measures developed by J. L. Moreno (1953) and R. Tagiuri (1952) to assess Ss' family, school, and social integration. The contradictory aspects of wishes, fears, expectations, and behavior inherent to the adolescent period are examined. The importance of the process of adaptation to the family, school, and social environment is emphasized for effective resolutions. (French & German summaries) (28 ref)—*English summary.*

568. Marshall, Victor W. (Princeton U) **Continued living and dying as problematical aspects of old age.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 873-874.

569. McCluskey, K. W. et al. (U Manitoba, Winnipeg, Canada) **Cross-cultural differences in the perception of the emotional content of speech: A study of the development of sensitivity in Canadian and Mexican children.** *Developmental Psychology*, 1975(Sep), Vol 11(5), 551-555.—Examined and compared the ability of Canadian and Mexican children to identify the emotional content of vocal expressions. Ss were 10 males from each country at each age 6-11 yrs. 10 male Canadian and 10 male Mexican undergraduates also served as Ss. Canadian and Mexican actresses, speaking any words they wished in their respective languages, simulated the emotions of happiness, sadness, love, and anger. After the initial recording, speech samples were arranged in random order and then rendered unintelligible by means of an electronic filtering device (which removed semantic content while leaving intact the tonal qualities of speech). When the filtered vocal expressions were played to Ss, a progressive increase with age in ability to identify correctly the emotions expressed was found. Further, the Mexican Ss overall were significantly more sensitive than the Canadian Ss. However, Ss from both countries judged the speech samples from Mexican actresses more accurately than those from Canadian actresses. (17 ref)—*Journal abstract.*

570. McMahan, Ian D. (Brooklyn Coll, City U New York) **Sex and person in achievement and moral evaluation.** *Developmental Psychology*, 1975(Sep), Vol 11(5), 659-660.—Examined the effects on moral and achievement evaluations of sex of evaluator and actor, and of the evaluator evaluating himself. Data from 2 studies with a total of 220 undergraduates support the previous conclusion, with some qualifications, that achievement, relative to morality, becomes primarily an outcome-oriented reward system whereas morality becomes primarily an intent-oriented punishment system.

571. O'Connor, Margaret. (Children's Memorial Hosp, Child Psychiatry, Chicago, IL) **The nursery school environment.** *Developmental Psychology*, 1975(Sep), Vol 11(5), 556-561.—Observed 48 preschool-age children in 2 nursery school settings for social and dependency behavior. The schools were similar in most respects but differed in child-teacher ratio and grading. School 1 had a child-teacher ratio of 3.5:1; School 2 had a ratio of 7:1. Findings indicate that in the setting with more adults present per child, Ss interacted significantly more with adults and less with peers. Different factors for interaction were found for the schools, but patterns were similar over both settings with Ss high in adult interaction tending not to interact with peers and, conversely, Ss low in adult interaction tending to interact more with peers. Observations showed the groups to be similar in overall frequency of dependency; however, Ss in the high-adult setting made proportionally more adult-directed dependency bids. Frequencies of social behaviors were compared with previous results. Principal findings for frequencies of social interaction, dependency, and patterns of interaction are attributed to the effect of the child-teacher ratio.—*Journal abstract.*

572. Poveda, Tony G. (State University Coll New York, Plattsburgh) **Reputation and the adolescent girl: An analysis.** *Adolescence*, 1975(Spr), Vol 10(37), 127-136.—Analyzed the major social types in a class of 400 high

school seniors. The maintenance of a good reputation (GR) was important to nearly all the types, although the definition of a GR differed widely. Reputation was seen as a function of both actual behavior and the information distribution system, with gossip being the major weapon of information regulation. There were few positive valuations for maintaining a GR and severe sanctions for failing to maintain it.—A. Krichev.

573. Prochnow, Robert R. (U Texas, Austin) **The relative saliency of certain physical features for young children.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 621.

575. Sturzebecher, K. & Herrmann, Th. (Pädagogischen Hochschule Niedersachsen, Hannover, W Germany) [Teacher dependence and parent upbringing: An investigation of a moral dilemma.] (Germ) *Zeitschrift für Entwicklungspsychologie und Pädagogische Psychologie*, 1974, Vol 6(3), 168-177.—Examined determinants which contribute to a prediction and to an explanation of why different pupils choose, in their "moral dilemma," to adhere to teacher or to peer group norms. An index measuring teacher or peer dependence was developed and administered to 315 5th and 6th graders (mean $A = 11.6$). Results show that Ss from authoritative homes were more inclined to behave in ways demanded and expected by the teacher and school; conversely, Ss from less authoritative homes were less inclined to behave in line with teacher-school standards and to be more responsive to peer models. Results are viewed in the context of high agreement in expectations of teachers and authoritative (middle class) parents. (English summary)—R. Scott.

576. Vance, John J. & Richmond, Bert O. **Cooperative and competitive behavior as a function of self-esteem.** *Psychology in the Schools*, 1975(Apr), Vol 12(2), 225-229.—Investigated the effects of self-concept, sex, and race on the cooperative-competitive behavior of 240 children 8-12 yrs old. The Piers-Harris Children's Self-Concept Scale and Kagan's Cooperation-Competition Game were the instruments. Analysis of variance in a $3 \times 2 \times 2$ factorial design indicated the following: (a) Black children were more cooperative than White children. (b) Low self-concept children were more cooperative than those with high self-concept. There were no significant sex differences.—H. Kaczowski.

577. Weissenburger, Fred E. & Loney, Jan. (U Iowa) **More on the "alphabetic neurosis."** *Psychology in the Schools*, 1975(Apr), Vol 12(2), 215-218.—Replicated the work of Autry and Barker by reexamining the relationship among intelligence, achievement, sex, and alphabet position. Ss were 59 1st graders and 76 6th graders. No relationship was found between alphabetic position of surname, age, sex, and achievement, general adjustment, self-esteem, or impulse control.—H. Kaczowski.

578. Wiener, Jacob G. (New York U) **Study of family and peer relationships as they affect identity and interdependence of five-year old children in group day care centers.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 883-884.

579. Williams, John E.; Bennett, Susan M. & Best, Deborah L. (Wake Forest U) **Awareness and expression of sex stereotypes in young children.** *Developmental Psychology*, 1975(Sep), Vol 11(5), 635-642.—On the basis of male and female sex stereotypes defined in a study of young adults, a children's picture-story technique known as the Sex Stereotype Measure was developed and administered to 284 Euro-American kindergartners and 2nd and 4th graders. Principal findings were (a) Kindergartners show an appreciable degree of knowledge of adult sex stereotypes (b) This knowledge increases to the Grade 2 level but shows no further increase during the next 2 yrs. (c) Knowledge of sex stereotypes appears to develop in a similar manner among both boys and girls. (c) The male stereotype is learned at an earlier age than the female stereotype. (e) Expression of stereotypic responses sometimes is influenced by the sex of the examiner. It is concluded that this method represents a promising approach to the assessment of sex stereotypes in preschool and early school-age children. (18 ref)—*Journal abstract*.

580. Young, C. M. (Australian National U, Canberra) **Ages, reasons and sex differences for children leaving home: Observations from survey data for Australia.** *Journal of Marriage & the Family*, 1974(Nov), Vol 36(4), 769-778.—Reports results which show that daughters leave home about 2 yrs younger than sons and that a higher proportion of daughters leave home for marriage than for other reasons compared with sons. It was found that for both sexes the average age at leaving home is youngest when the reason for leaving is education or a job and oldest when the reason is marriage.

SOCIAL PROCESSES AND SOCIAL ISSUES

581. Carpenter, Edwin H. (Pennsylvania State U) **An exploration of the factors determining support of the consumer movement.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1369.

582. Davis, Glenn. **The maturation of Theodore Roosevelt: The rise of an "affective leader."** *History of Childhood Quarterly: The Journal of Psychohistory*, 1975(Sum), Vol 3(1), 43-74.—Continues an earlier article about Roosevelt (1975). Rough sports and physical exercise were important in his daily routines. Roosevelt graduated from Harvard with a distinguished record. He consistently repressed all expressions of hostility toward his parents; hyperaggressiveness was his primal means of coping with maternal abandonment. His heroics in Cuba illustrate his belief in his own invincibility. Roosevelt admitted his fascination with the process of death. It is concluded that a study of the psychic origins of the Progressive Period and its representation in the psychology of Roosevelt is a study of the period's weaknesses and strengths. (5 p ref)—R. D. Nance.

583. Ebel, Henry. (Richmond Coll, City U New York) **On writing good psychohistory.** *History of Childhood Quarterly: The Journal of Psychohistory*, 1975(Sum), Vol 3(1), 137-140.—There are 3 requirements for the writing of good psychohistory: empathy, courage, and intelligence. The Nazi SS (Schutzstaffel) was the most glamorous and most successful of all the great murder

bands in history. The Nazi leaders had an intuitive understanding of mass need. Empathy involves identification, and it seems difficult to identify with the Nazis. The author draws a parallel between Nazi ceremonials and religious ceremonials and interprets Nazi ideology in terms of Freud's first 3 psychosexual stages, the most important being the Oral.—*R. D. Nance.*

584. **Etzioni-Halevy, Eva.** (Tel-Aviv U, Israel) **Patterns of conflict generation and conflict "absorption": The cases of Israeli labor and ethnic conflicts.** *Journal of Conflict Resolution*, 1975(Jun), Vol 19(2), 286-309.—This comparison of labor and ethnic conflict in Israel is intended to substantiate 2 theses. The 1st maintains that ideologies have more to do with patterning conflict than merely with legitimizing interests and counterinterests; specifically, that when ideological commitments and interests do not coincide, this will lead to ambiguities (i.e., to activities which work at cross-purposes to each other). The 2nd thesis is that when an establishment is confronted by conflict, it may develop certain patterns of conflict absorption by which the conflict is neither suppressed nor yet allowed to generate any substantial social changes. These patterns usually include symbolic reassurances, devices for attenuating demands and for depleting the aggrieved parties' ranks, partial responsiveness, and maintenance of the establishment itself and the basic framework of the society relatively unchanged. (24 ref)—*Journal abstract.*

585. **Frohlich, Norman; Hunt, Thomas; Oppenheimer, Joe & Wagner, R. Harrison.** (U Texas) **Individual contributions for collective goods: Alternative models.** *Journal of Conflict Resolution*, 1975(Jun), Vol 19(2), 310-329.—Notes that there is a growing controversy as to what behavior is to be expected of individuals regarding contributions for the supply of collective goods. This paper attempts to settle some of the controversy. It attempts to do so not by showing that one of the positions taken is correct and the others wrong, but by showing that the various authors in question reach different conclusions about individual behavior in situations involving the potential supply of collective goods because they make different assumptions regarding the nature of the goods and the nature of the situations in which the individuals find themselves. The different conclusions are reconciled by a careful examination of the assumptions of the authors. Specific variables are identified which account for the differences in the models, and a set of dimensions along which collective goods situations can vary is presented. *Journal abstract.*

586. **Goldstein, Kenneth M. & Blackman, Sheldon.** (Staten Island Children's Community Mental Health Ctr, NY) **Generalizations regarding deviant groups.** *Psychological Reports*, 1975(Aug), Vol 37(1), 278.—Generalizations about 10 groups (e.g., mentally ill or drug addicts) were obtained from 81 undergraduates by using the D. Katz and K. W. Braly technique (1933) Scale values for favorableness assigned to the 10 most frequently occurring adjectives for each group indicate a positive cluster of Ideal Person, Ideal Person and Physically Disabled, a neutral cluster of Americans, Mentally Retarded, Negroes, and Mentally Ill, and a

negative cluster of Drug Addicts, Criminals, and Alcoholics.

587. **Goodich, Michael.** (U Haifa, Israel) **Bartholomaeus Anglicus on child-rearing. History of Childhood Quarterly: The Journal of Psychohistory, 1975(Sum), Vol 3(1), 75-84.—Notes that the 13th century was a time of intellectual consolidation. Attempts were made to compose encyclopedic compilations from authoritative sources. All these works contained accounts of the life span development of the human organism. Perhaps the most widely disseminated was that by Anglicus. In the course of 300 yrs, it was translated into 6 languages. The Latin version is largely a condensation by ancient and modern philosophers with some original commentary. The limited number of sources employed in the descriptions of child rearing suggest the popular, nonscholarly orientation of Anglicus's work.—*R. D. Nance.***

588. **Gurak, Douglas T.** (U Wisconsin) **Religiosity and radicalism: The case of the University Christian Movement.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1373.

589. **House, J. D.** (U Calgary, Canada) **Structured forms of social behaviour: Colleague relations in the real estate business.** *Canadian Journal of Behavioural Science*, 1975(Jul), Vol 7(3), 201-215.—Notes that behavioral sociologists and psychologists have been concerned mainly with explaining elementary forms of social behavior and with building towards macrolevel from microlevel social processes. The present article attempts to add to behavioral sociology by showing how reward and cost opportunities at the microlevel are "structured by" wider social systems for most complex forms of social behavior. An analysis of colleague relations among residential real estate agents illustrates the argument. Their role as middlemen in a wider system of property exchange, and the commission system through which they are rewarded, force agents into a situation of "structural ambivalence" in their colleague relations. This structural ambivalence is dealt with by a set of collective defense mechanisms which account for the dynamics of emergent daily interaction among colleagues. (French summary)—*Journal abstract.*

590. **Kren, George & Rappoport, Leon.** (Kansas State U) **SS atrocities: A psychohistorical perspective.** *History of Childhood Quarterly: The Journal of Psychohistory*, 1975(Sum), Vol 3(1), 130-137.—There was virtually no crime known to mankind that was not committed by members of the Nazi SS (Schutzstaffel). Psychohistory's constituent disciplines have been unable to offer useful explanations of extraordinary events. Activities of the SS pose a direct theoretical challenge to psychohistory. The SS was a unique organization which functioned effectively because it was free of the internal super ego and id conflicts that trouble most comparable-sized organizations. By conventional psychiatric standards, the SS men were not seriously maladjusted. It is concluded that we should look, not at the motives for violence, but at the conditions under which the usual moral inhibitions against violence became weakened.—*R. D. Nance.*

591. **Kristol, Irving.** (New York U) **Moral and ethical development in a democratic society.** *Proceedings of the ETS Invitational Conference*, 1974, 1974, 3-14.—Discusses the nature of morality in the context of responsiveness

to the perceived needs of dissatisfied groups. The examples discussed have relevance to the social psychology of groups, leadership, group goals, moral development, and the education of disadvantaged individuals.—H. E. Yaker.

595. Rafky, David M. (Biscayne Coll, Div of Public Administration & Criminal Justice) **Police cynicism reconsidered: An application of smallest space analysis.** *Criminology: An International Journal*, 1975(Aug), Vol 13(2), 168-192.—Replicated A. Niederhoffer's (1963, 1967) research, using a population of 396 urban police, and tested the relationships between indices of frustration, cynicism, and anomia. A battery of instruments and scales was administered, including Niederhoffer's Scale of Police Cynicism. Contrary to Niederhoffer's expectations, cynicism was not prevalent among police outside New York City; cynicism could be described adequately only with reference to 3 dimensions; most indices of frustration did not significantly correlate with 2 subscales of cynicism; and cynicism did not intervene in the relationships between a number of independent variables and anomia. An alternate model based on R. K. Merton's (1957) conceptualization of anomia as the result of a discrepancy in cultural values and institutionalized means for attaining such goals was tested. Results indicate that perceived means-goals discrepancy vis-à-vis legal norms and goals intervened in the relationships between rank and anomia and years on force and anomia. (16 ref)—*Journal abstract*.

596. Salancik, J. R. (U Illinois, Urbana) **Liberation or poverty? An indirect assessment of the impact of potential future events on society.** *Journal of Applied Social Psychology*, 1975(Apr-Jun), Vol 5(2), 173-185.

Tested a methodology which suggests that one can evaluate the potential impact of future decisions or events on various societal groupings (poor vs rich; Black vs White) by correlating the values promoted by the event or decision with the values desired by the societal groupings. 9 judges (clerical and research staff) were asked to rate the contributions of 2 events to 18 social values. The values of 6 societal income groupings from "Under \$4,000" to "Over \$15,000" were correlated with the values judged to be promoted by the 2 events. One event suggested that US monies be shifted from military spending to urban aid, as expected, the values promoted by this event were more highly correlated with those of lower than with those of higher income groups. The 2nd

event suggested that women have equal opportunities in professional and managerial jobs; as expected, the values of higher income groups would be served more by this event than would the values of lower income groups. This study substantiates that the assessment methodology proposed is feasible, meaningful, and that raters make consensual and reliable judgments that discriminate the events as predicted. (17 ref)—*Journal abstract*.

597. Smith, Anthony D. **Nationalism.** *Current Sociology*, 1973, Vol 21(3), 185 p.—Reviews trends in sociological research on nationalism, emphasizing nationalist ideologies and movements. Although there are numerous psychological themes in the literature on nationalism, psychologists have tended to study nationalism only insofar as it illuminates more general mechanisms of group behavior. (French summary) (590 ref)—R. L. Cook.

598. Synak, Brunon. (U Gdańsk, Poland) **[Farmers' attitudes concerning the destiny of their farms.]** (Polh) *Studia Socjologiczne*, 1974, Vol 4(55), 225-244.—Studied the attitude of farmers and their heirs. Most farm operators had a positive attitude toward their work. The heirs were not interested in working on the farm or inheriting it. Marriage was the chief reason for not staying on the farm.—H. Kaczkowski.

601. Cool, John. (Harvard U, Ctr for Population Studies) **Children in the second India.** *Carnets de l'Enfance*, 1975(Jan-Mar), Vol 29, 61-71.—Describes the magnitude of problems facing India as a result of expected population growth by the end of this century.

602. Ehrlich, Ira F. (St Louis U, Inst of Applied Gerontology) **The aged Black in America: The forgotten person.** *Journal of Negro Education*, 1975(Win), Vol 44(1), 12-23.—Reviews research on needs and psychosocial characteristics of Blacks aged 65 or over and emphasizes the need for training gerontologists, especially Blacks, to provide educational activities for aged Blacks and to study their subcultures. Basic needs of aged Blacks concern housing, health, and income; they fare substantially worse than aged Whites in all 3 needs areas, partly because of racism. Federal funds recommended to facilitate educational goals of aged Blacks have evidently not been provided. A stratified random sample of 71 female and 29 male aged Blacks from a midwestern public housing project seemed interested in social interaction. Income, education, and health appeared related to morale, measured by the Life Satisfaction Index, and to ability to participate in and benefit from educational activities. It is concluded that educational institutions and the Federal government should help to education aged Blacks and to develop Black gerontologists. (38 ref)—B. M. Anthony.

603. Feather, N. T. (Flinders U of South Australia, Bedford Park) **Values and income level.** *Australian Journal of Psychology*, 1975(Apr), Vol 27(1), 23-29.—Administered Form D of the Rokeach Value Survey to respondents in 2 samples in metropolitan Adelaide in 1972 and 1973. The relative importance assigned to each value was analyzed across 5 levels of income for heads of households in each sample. 147 heads of household responded in 1972, 241 in 1973. As in Rokeach's 1968 American survey, "being clean" was assigned higher relative importance by lower income groups than by higher income groups both in 1972 and 1973. In both years, higher income groups assigned relatively more importance than lower income groups to "a sense of accomplishment," "mature love," and being "logical." The Adelaide results and Rokeach's results are compared and discussed.—*Journal abstract*.
604. Joshi, Purushottam. (U Laval, Quebec, Canada) **[A functional analysis of contemporary mental health.]** (Fren) *Annales Médico-Psychologiques*, 1975(Apr), Vol 1(4), 425-450.—Examines changed conceptions of mental health that result from alterations in contemporary sociocultural forces. It is argued that the focus has shifted from intrapsychic factors to a consideration of those elements external to the individual that shape his behavior. B. F. Skinner's proposition for the control of individual behavior in a social context is examined for its appropriateness to the definition of mental health.
605. Kilwein, John H. (U Pittsburgh) **The social class of young adults and their views on family relations, education, careers, and health.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1364-1365.
606. Kutner, Nancy G. (Emory U) **The poor vs. the non-poor: An ethnic and metropolitan-nonmetropolitan comparison.** *Sociological Quarterly*, 1975(Spr), Vol 16(2), 250-263.—Indicators of 29 of O. Lewis's (1968) poverty traits were examined to see if poor and nonpoor families differed significantly in frequency of demonstrating the traits. Approximately 2,600 families representing 6 ethnic-residence population types were considered: metropolitan and nonmetropolitan Black, White, and Spanish-speaking. Of the 29 traits investigated, for 24 traits a significant difference was found between poor and nonpoor in at least one ethnic residence group. Significant differences between poor and nonpoor in the 2 Spanish-speaking groups existed on considerably fewer traits than in the case of the 2 Black or the 2 White groups, suggesting that the traits examined may be more broadly based in Spanish culture.—*Journal abstract*.
607. Lifshitz, Michaela; Baum, Ronie; Balgur, Irith & Cohen, Channa. (U Haifa, Israel) **The impact of the social milieu upon the nature of adoptees' emotional difficulties.** *Journal of Marriage & the Family*, 1975(Feb), Vol 37(1), 221-228. Examined differences in developmental trends of symptomatology between 30 adopted 6-13 yr olds and a matched group of biological children, all referred to a child guidance clinic and reared within the kibbutz communal educational system. Results indicate that kibbutz adoptees' symptoms show a specificity different from that reported in other studies for city adopted children; they convey significant feelings of insecurity and rootlessness, manifested in low concentration ability, restlessness, and possible lack of energy in testing out social relationships. Adoptees behavior contrasts the more aggressive interactions of biological problematic children. Since differential parental attitudes are not significant enough to explain findings, several alternative suggestions, embedded within the life system of the kibbutz, are offered. (34 ref)—*Journal abstract*.

614. Singh, Karam. (Ministry of Health & Family Planning, New Delhi, India) **Population, poverty and the future of India.** *Carnets de l'Enfance*, 1975(Jan-Mar), Vol 29, 9-18. Reports that policies of the Fifth Plan for India officially recognize the link between population and poverty. They are to be implemented through projects directed toward betterment of the economic

situation of the people by (a) population control and (b) technological growth.

615. Welch, Susan. (U Nebraska, Lincoln) **Support among women for the issues of the women's movement.** *Sociological Quarterly*, 1975(Spring), Vol 16(2), 216-227.—Using 1972 data from a national and community sample, support among women for issues relevant to the women's rights movement and the extent to which the issues of the movement are perceived as a coherent whole by women were examined. 5 distinct issue dimensions emerged: women's rights, legislative candidates, abortion reform, equality of treatment, and competence. Support for or agreement with each of the issue areas was only slightly correlated with support for the others. Thus, some types of women are supportive of the variety of issues and in agreement with the basic assumptions of the movement while others are more selective in their support. In general, support for any particular issue area was greater than support for women's liberation, yet even those opposing women's liberation agree with the position of the women's movement on a majority of issues examined.—*Journal abstract*.

635. Albas, Daniel C. (U Colorado) **Sociological explanations of family conflict.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 881-882.

636. Cretser, Gary A. (U Southern California) **Status consistency and its effects on marital adjustment and stability.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 882.

637. English, Fanita. **Shame and social control.** *Transactional Analysis Journal*, 1975(Jan), Vol 5(1), 24-28. Considers that shame operates with the force of a life-and-death instinct. The human capacity to experience shame is discussed and distinguished from guilt. The shaming process instills a special fear; the more a young child is shamed, the more adapted he becomes to the expectations of his caretakers and the more his creative drive is inhibited. The psychological acceptance of oppression occurs because of vulnerability to shame; liberation movements have intuitively recognized the necessity to confront culturally transmitted shame messages. Individual autonomy is achieved as secret shame is uncovered and questioned.—R. Tomasko.

638. Fox, Greer L. (Bowling Green State U) **Love match and arranged marriage in a modernizing nation: Mate selection in Ankara, Turkey.** *Journal of Marriage & the Family*, 1975(Feb), Vol 37(1), 180-193.—Reports results of a study which suggests that the adoption of

innovation in marriage patterns is greatest among modern segments of the Ankara population, that homogamy is as great among self-selected as among kin selected spouses, and that the type of marriage arrangement has a small but independent impact on marriage behavior. (31 ref)

639. Gecas, Viktor & Nye, F. Ivan. (Washington State U) **Sex and class differences in parent-child interaction: A test of Kohn's hypothesis.** *Journal of Marriage & the Family*, 1974(Nov), Vol 36(4), 742-749.—Examined sex and class differences in the style and circumstances of parental discipline of the child. Attention was focused on M. Kohn's (1969, 1963) hypothesis that white collar parents stress the development of internal standards of conduct in their children and thus are more likely to discipline on the basis of their interpretation of the child's motives, while blue collar parents are more likely to react on the basis of the consequences of the child's behavior. Findings, based on a sample of 210 couples who were parents of 3rd graders, support this hypothesis. A greater difference was found in the responses of white collar parents toward their child when he "accidentally breaks something" vs when he "intentionally disobeys" than there was for blue collar parents. Other class and sex differences in parental response to the child are also explored. (17 ref)—*Journal abstract*.

640. Glenn, Norval D. (U Texas, Austin) **Psychological well-being in the postparental stage: Some evidence from national surveys.** *Journal of Marriage & the Family*, 1975(Feb), Vol 37(1), 105-110. Reports that according to data from 6 US national surveys, middle-aged women whose children have left home report, as a whole, somewhat greater happiness and enjoyment of life than women of similar age with a child (or children) living at home, and the former report substantially greater marital happiness than the latter. Findings, considered in conjunction with consistent findings from retrospective and longitudinal studies, are convincing evidence that the children's leaving home does not typically have an enduring negative effect on the mother's psychological well-being.—*Journal abstract*.

641. Glick, Paul C. (US Dept of Commerce, Bureau of the Census, Washington, DC) **A demographer looks at American families.** *Journal of Marriage & the Family*, 1975(Feb), Vol 37(1), 15-26.—Discusses statistics and trends in American marriages since the 1930s. Some topics covered are recent changes in marriage and fertility, recent delay in marriage among the young, early marriage and high fertility of those approaching middle age, divergence and convergence of divorce by social level, the upturn in divorce rate, no-fault divorce laws, and changes in living arrangements.

644. Hepker, Wilma & Chod, Jerry S. (Walla Walla Coll) **Role relationships and role performance: The**

male married student. *Journal of Marriage & the Family*, 1974(Nov), Vol 36(4), 688-695.—Studies immediately after World War II revealed significant differences between the academic performances of married and single college students which more recent studies have consistently failed to find. This discrepancy suggests the hypothesis that the roles of student and husband are more integrated in the case of the older student who has returned to school than in the case of the younger student who has married while in school. Ss in the present study were drawn from a church-related college of about 1,000 students, of whom 174 were married. 50 male married and 50 male single students, matched for year in college and hours of work per week, were selected. While older married Ss did have more integrated roles and performed somewhat better, closer examination of the data indicated that role integration and academic performance were negatively related. Apparently the economy of sanctions resulting from role integration leads to a selection process slightly adverse from the standpoint of academic ability. (19 ref) —*Journal abstract.*

645. Kolb, Trudy M. & Straus, Murray A. **Marital power and marital happiness in relation to problem-solving.** *Journal of Marriage & the Family*, 1974(Nov), Vol 36(4), 756-766.—Data on intrafamily power relations, obtained by observing the interaction of 63 husband-wife-child groups during a laboratory problem-solving session, were related to ratings of marital happiness. Families above the median in husband-to-wife power tended to be high in marital happiness, but no difference in marital happiness was found when families with low- and high-power wives were compared. High parent-to-child power was associated with high marital happiness but high child-to-parent power was associated with low marital happiness. Findings are interpreted as reflecting stresses which occur as the power structure of the family changes from its present hierarchical form to a more equalitarian form. However, since low husband power was found to be associated with low problem-solving ability, part of the low happiness ratings of families with low-power husbands probably reflects dissatisfaction with the low competence rather than the low power of the husband. (32 ref) —*Journal abstract.*

646. McCahan, George R. (Columbia U) **The relationship between self concept and marital satisfaction.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 173.

647. Nijhawan, Harbans K. & Verma, Prem. (Punjab U, Chandigarh, India) **Children's attitudes towards social change in relation to parental attitudes towards child rearing.** *Journal of Social Psychology*, 1975(Aug), Vol 96(2), 293-294.—Assessed the attitudes of 80 mothers and 80 fathers toward child rearing and their 80 children's (mean age, 16.7 yrs) attitudes toward social change. Significant differences in attitudes toward child rearing were found between responses of parents of conservative children and parents of radical children.

648. Orthner, Dennis K. (U North Carolina, Greensboro) **Leisure activity patterns and marital satisfaction over the marital career.** *Journal of Marriage & the Family*, 1975(Feb), Vol 37(1), 91-102.—Investigated the

relationship between the proportion of time husbands and wives spend in individual, joint, and parallel leisure activities, and marital satisfaction over 5 marital career periods. A probability sample of upper-middle-class families in a moderate sized city yielded 216 husbands and 226 wives for the study. Results suggest that the 3 leisure activity patterns are differentially related to marital satisfaction, that husbands and wives are not influenced alike by leisure, and that the marital career period is a most critical variable in determining the influence of leisure. (45 ref)—*Journal abstract.*

649. Raina, M. K. (National Inst of Education, New Delhi, India) **Parental perception about ideal child: A cross-cultural study.** *Journal of Marriage & the Family*, 1975(Feb), Vol 37(1), 229-232.—Conducted a study to determine what concepts Indian mothers have of the ideal child in terms of what they believe should be encouraged and discouraged, and compared the results with the concepts of US parents and experts on creative personality. E. P. Torrance's Ideal Pupil Checklist was administered to 45 mothers in Indore, India. A rank-order coefficient of correlation of .75 was obtained between the ranks assigned by Indian mothers and American parents; and .11 between the ranks of Indian mothers and experts on creative personality. Both—Indian and American parents—emphasize conformity, obedience, and the receptive nature of man and de-emphasize independent judgment, guessing, and nonconformity.—*Journal abstract.*

650. Roberto, Eduardo L. (U Wyoming) **Marital and family planning expectancies of men regarding vasectomy.** *Journal of Marriage & the Family*, 1974(Nov), Vol 36(4), 698-706.—Previous research investigating vasectomy attitude has studied men who had already obtained the operation and has identified their postoperative sexual and psychosocial adjustments together with the relation of these factors to verbalized attitudes. The present research studied potential vasectomees and investigated their attitude as regards (a) the organization of their expectancy beliefs about vasectomy and (b) the structural relationships between their attitude and expectancy beliefs. Ss were 141 married men who were, on the average, in their mid-30's, Catholic, professionals, and had 2-3 children. The analysis identified (a) an organization of expectancy beliefs into 6 clusters and (b) the key belief determinants of attitude (i.e., expectancy of full enjoyment of sex (most important), wife's relief from contraceptive burdens, strengthened marital fidelity, gaining self-control, doing one's share in population control, and higher living standard). Theoretical implications and their practical implications to the screening and counseling of prospective vasectomies are discussed. (28 ref)—*Journal abstract.*

651. Rosenblatt, Paul C. (U Minnesota, Minneapolis) **Behavior in public places: Comparison of couples accompanied and unaccompanied by children.** *Journal of Marriage & the Family*, 1974(Nov), Vol 36(4), 750-755.—Observed a total of 440 adult couples, some with and some without accompanying children, in 8 different kinds of public places. Couples with children were observed to touch, talk, and smile less at one another. It is noted that the smiling effect may be an artifact of situations in which adults travel without children or of

the kinds of adults who travel in situations where children are absent (17 ref) *Journal abstract*

653. Spicer, Jerry W. & Hampe, Gary D. (Peninsula Coll) Kinship interaction after divorce. *Journal of Marriage & the Family*, 1975(Feb), Vol 37(1), 113-119. —Conducted interviews with 62 male and 42 female divorcees in order to determine the kinship interaction of the divorced family. Hypotheses were tested relating to the frequency of contact of divorcees with their consanguineal and affinal relatives. Affection between the divorcees and their consanguines is present both before and after the divorce and contributes to maintaining kinship interaction. However, the affectional and/or obligational bond with affines is weakened or eliminated following the divorce. The reasons for maintaining contact with former affines are holding those status attributes such as having children present and being female which symbolize the family. (18 ref)—*Journal abstract*.

658. White, Jerome D. & White, Terri. Cultural scripting. *Transactional Analysis Journal*, 1975(Jan), Vol 5(1), 12-23.—Cultural scripting is the set of reinforcements or limitations established by the Parent values embodied in cultural institutions. Survival-worthy behaviors are reinforced through 3 institutions: the family (primary), the school (secondary), and the job (tertiary). Scripting represents a developmental process in individuals, with predispositions to develop sensitivities to scripting processes surviving and being generative. In a culture not undergoing swift value changes, the scripting pattern will interleaf with life expectancies. Topics considered include subcultures, implications for mass change, the therapeutic community, and adjustment.—R. Tomasko.

659. Yinon, Yoel. (Bar-Ilan U, Ramat-Gan, Israel) Authoritarianism and prejudice among married couples with similar or different ethnic origin in Israel. *Journal of Marriage & the Family*, 1975(Feb), Vol 37(1), 214-220. —20 married couples whose ethnic origin was similar and 20 whose ethnic origin was different answered questionnaires designed to measure their F-scale scores and degree of prejudice toward the other ethnic group

(oriental or western). Average age of Ss was 25 yrs; average education was 12 years. It was found that Ss from heterogeneous couples were less authoritarian than Ss from homogeneous couples. On 3 measures of prejudice (social distance, characteristics' evaluation, and attitudes toward behavior expressing prejudice), it turned out that Ss from heterogeneous couples were less prejudiced than the other Ss. It was also found that Ss who scored high on the F-scale exhibited more prejudice than Ss whose F-score was low. Findings are discussed in terms of the possible selective nature of the heterogeneous Ss and in terms of the effect interpersonal contact has on the reduction of prejudice.—*Journal abstract*.

Political & Legal Processes

660. Boor, Myron. (Fort Hays Kansas State Coll) Effects of victim competence and defendant opportunism on the decisions of simulated jurors. *Journal of Social Psychology*, 1975(Aug), Vol 96(2), 301-302.—Used case accounts of a crime to test the popular assumption that severity of juridic judgment may be increased by evoking sympathy for the victim, especially when this is done by emphasizing the extent to which opportunistic advantage had been taken of the victim's frailties. Data from 4 case accounts that were judged by a total of 56 undergraduates indicate no differences in punishments assigned to incompetent or competent victims, thus casting doubt on this common belief.

661. Dabbs, James M. (Georgia State U) Attitudes toward winner and loser after an election. *Social Behavior & Personality*, 1975, Vol 3(1), 45-48.—Describes (a) a study of the 1968 national election, in which 83 university students completed a questionnaire 9 wks before, 5 days before, and 9 wks after the election; and (b) a role-played election study in which 69 students completed questionnaires on 1 of 4 hypothetical elections. Results suggest that candidates are viewed more favorably after an election, regardless of whether they have won or lost. The loser is apparently not derogated as a result of having lost. Further, males and females seem to differ in the kind of winner they prefer, with males becoming more favorable toward a candidate who has won by a narrow margin and females becoming more favorable toward a candidate who has won by a large margin.—*Journal abstract*.

662. Drevlow, Robert. DeFunis v. Odegaard: The future of reverse discrimination. *Pupil Personnel Services Journal*, 1975, Vol 4(1), 3-5.—Summarizes Justice Douglas's minority opinion concerning the admission of minority vs nonminority students to law school.—R. W. Covert.

663. Ebbesen, Ebbe B. & Konecni, Vladimir J. (U California, San Diego) Cognitive algebra in legal decision making. *Center for Human Information Processing Technical Report*, 1974(Oct), No 46, 40 p.—Conducted 2 studies to determine how real felony-court judges decide on the amount of bail to set. In Exp I 18 municipal and superior court judges were presented with fictitious case histories containing the relevant information in a factorial design. In Exp II multiple regression techniques were used to examine the impact of different kinds of information on decisions made by 5 of the judges in actual bail hearings. In the simulated cases the

judges seemed to be influenced most by the degree to which the accused was tied to the area and whether or not he had a prior criminal record. However, the judges' actual bail decisions were not affected by these variables. Instead, their decisions were almost exclusively determined by the district attorneys' recommendations. Both the district attorneys' and the defense attorneys' actual recommendations were primarily based upon the severity of the crime. Results are discussed in terms of the utility of simulation and observational research for drawing applied and theoretical conclusions. (15 ref)—*Journal abstract*.

664. Houghton, Beverly D. (U Minnesota) **Conscientious objection: Socialization and social deviance.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 872.

665. Howard, Mary K. (U Colorado) **Police encounters with juvenile offenders.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1382-1383.

666. Lind, E. Allan. (U North Carolina, Chapel Hill) **The exercise of information influence in legal advocacy.** *Journal of Applied Social Psychology*, 1975(Apr-Jun), Vol 5(2), 127-143.—Studied information search and transmission behavior of information-supplying agents to test social psychological predictions concerning the use of information influence and to test assumptions of proponents of the American adversary system in law. 104 paid male 1st-yr law students acted as attorneys under conditions of high correspondence of outcomes with the judge vs high correspondence of outcomes with an involved party; perception that the outcomes of another attorney in the situation were correspondent with the judge vs correspondent with an involved party; and the discovery that the information environment was favorable, ambiguous, or unfavorable. Significant greater information search was observed for party-oriented Ss relative to judge-oriented Ss only when the information environment was unfavorable. Party-oriented Ss showed greater attempted use of information influence. Analyses of the amount and distribution of the information transmitted by pairs of Ss assessed the characteristics of several legal "systems." Theoretical and applied implications of the study are discussed. (19 ref)—*Journal abstract*.

667. Lindén, Michael. (U Uppsala, Sweden) **Political dimensions and relative party positions: A factor analytical study of Swedish attitude data.** *Scandinavian Journal of Psychology*, 1975, Vol 16(2), 97-107.—97 attitude statements were answered by Ss representing the 5 largest Swedish political parties and rated for content validity by the Ss and an expert group of political scientists. Correlations of the attitude variables were analyzed by the principal factor method. Factor scores were computed by multiple regressions, relative party positions calculated as party means, and the differences tested by a multiple comparison procedure. Following the results of an initial analysis 42 marker variables were further analyzed. A dimensional description based on an oblique 5-factor solution is presented. The existence and dominance of a general dimension related to the economic structure of society appears unquestionable. The generality of remaining dimensions is less evident

but gains substantial support by national and international comparisons. (34 ref.)

668. Loftus, Elizabeth F.; Altman, Diane & Gehlbach, Robert. (U Washington, Seattle) **Effects of questioning upon a witness' later recollections.** *Journal of Police Science & Administration*, 1975(Jun), Vol 3(2), 162-165.

—Tested the hypothesis that the descriptions of witnesses to a complex incident can be influenced by the type of questions used to interrogate them about the incident. 56 undergraduates were shown a 3-minute video tape of a disruption of a classroom by 8 demonstrators. Half of the students answered questions phrased in an "active" manner, and half received "passive" questions. One wk later, all Ss rated the video event on 4 scales: Ss whose initial questions were active rated the event as noisier, more violent, and thought that the demonstrators in the film were more belligerent and that the students in the classroom were more antagonistic. Data show that whoever interrogates a witness first can influence how the event is reported.—R. J. Albers

669. Loh, Wallace D. (U Washington, Law School, Seattle) **Nationalist attitudes in Quebec and Belgium.** *Journal of Conflict Resolution*, 1975(Jun), Vol 19(2), 217-249.—Conducted a questionnaire survey of nationalist attitudes of a nonrepresentative sample of 374 high school youth in Quebec and Belgium. Scales of political and cultural nationalism, constructed by factor analysis and interitem correlations, had satisfactory alpha reliability and concurrent validity. The effects of different kinds of status on nationalist attitudes were examined. Political nationalism was found related to ethnicity (ascribed status) and social class (achieved status), but not to the interaction of ethnicity and social class (status inconsistency). The relationship between bilingualism and nationalism was also explored. Bilingual fluency was associated with cultural, but not with political, nationalism. (49 ref)—*Journal abstract*.

670. Malsch, Herbert & Schüler-Springorum, Horst. (U Hamburg, W Germany) **The victim in the judicial procedure.** *International Journal of Criminology & Penology*, 1975(Feb), Vol 3(1), 63-69. Suggests that the victim in the judicial procedure should be considered the presumptive victim until the moment of res judicata. Studies of the victim in the judicial procedure should exclude pretrial stages and stop at posttrial stages.

671. Moore, Michael. (Israel Inst of Technology, Haifa) **Attitude toward capital punishment: Scale validation.** *Psychological Reports*, 1975(Aug), Vol 37(1), 21-22. Thurstone's Attitude toward Capital Punishment scale was found valid and reliable in predicting 44 undergraduates' reported vote on the California Death Penalty Proposition which advocated the reinstatement of the death penalty for certain crimes. No differential changes in either attitude or estimated probability of the proposition's passing were found in supporters vs opponents of the proposition as a result of the outcome of the vote.—*Journal abstract*.

672. Peszke, Michael A. (U Connecticut, Medical School) **Is dangerousness an issue for physicians in emergency commitment?** *American Journal of Psychiatry*, 1975(Aug), Vol 132(8), 825-828.—The laws of many of the states require a physician to determine that a mentally ill individual presents a danger to others before

the disturbed person can be civilly committed for involuntary treatment. It is argued that the prediction of dangerousness is not and should not be within the competence of medicine, but that physicians are competent to judge whether the severity of mental illness impairs a patient's competence to make an informed decision regarding treatment. The basic issue in emergency commitment is the patient's welfare, not his potential dangerousness.—*Journal abstract.*

673. Podmore, David; Chaney, David & Golder, Paul. (U Aston, Management Ctr, Birmingham, England) **"Don't know" responses among young adults in Hong Kong.** *Journal of Social Psychology*, 1975(Aug), Vol 96(2), 307-308.—Investigated a previous finding of a relatively large number of "don't know" responses given by Hong Kong residents to questions about attitudes toward police, government, and the political future of Hong Kong. Data from 1,123 interviews with 15-29 yr olds living in urban areas show that the percentage of "don't knows" was significantly greater for politically sensitive than for politically neutral statements.

674. Schwitzgebel, R. K. (Harvard U, Medical School, Boston) **Use and regulation of psychological devices.** *Behavioral Engineering*, 1975(Win), Vol 2(2), 44-46.—Discusses the recent rapid expansion in the use of psychological devices to measure and modify human behavior, although generally accepted standards for the use of these devices have not been developed. Some of the federal regulatory procedures applied to medical devices are inappropriate when applied to psychological items. Devices which do not produce a substantial alteration of the structure or function of the human body should not be regarded as medical devices. Product liability law can be developed to ensure safety and prevent fraud in the use and sale of psychological devices.—*Journal abstract.*

675. Smart, Reginald G. & Ogborne, Alan. (Addiction Research Foundation, Toronto, Canada) **Losses to the addiction notification system.** *British Journal of Addiction*, 1974(Sep), Vol 69(3), 225-229.—Examination of the records of a total of 248 narcotics addicts in clinic and therapeutic community groups in London, England, showed that the notification system does not detect all opiate users or even all of those for whom addiction could be suspected or has been established. Generalizing from the therapeutic community sample suggests an underestimation of 10-15% of established addicts in treatment outside of the clinics, while the non-modification of 19 of the clinic sample who were referred to other clinics, suggests an underestimation of about 12% of those for whom a reasonable suspicion of addiction exists. However, the underestimation of opiate users seeking treatment at clinics may be in excess of 46%.—*Journal summary.*

676. Stepleton, James V. (Washington U) **Legal issues confronting behavior modification.** *Behavioral Engineering*, 1975(Win), Vol 2(2), 35-43.—Considers the legal implications, for some types of behavior modification, of case and constitutional law in the areas of malpractice, the right to treatment, the doctrine of the least restrictive alternative, Eighth Amendment rights, and other protected individual rights. 2 recent cases are cited and the treatment standards and rights they may

have established. Research is suggested, and other actions to be taken by behavior modification professionals to safeguard their discipline. (31 ref)—*Journal abstract.*

677. Stone, Alan A. (Harvard U, Faculty of Law) **Comment.** *American Journal of Psychiatry*, 1975(Aug), Vol 132(8), 829-831.—Comments on an article by examined, A. Peszke (see PA, Vol 55:Issue 1) which argued that the prediction of dangerousness is not within the competence of medicine, but that physicians should be able to determine whether the severity of mental illness impairs a patient's ability to make an informed decision about treatment. Several additional considerations involved in this argument are examined and the problem of what to do when adequate treatment is not available is discussed.

Psychosexual Behavior & Sex Roles

678. Aldaba-Lim, Estefania. (Dept of Social Welfare, Manila, Philippines) **Women in the Philippines.** *Carnets de l'Enfance*, 1974(Oct-Dec), No 28, 67-77.—Presents a brief description of selected aspects of women's roles in the Philippines.

679. Barrell, James J. (U Florida) **Sexual arousal in the objectifying attitude.** *Review of Existential Psychology & Psychiatry*, 1974, Vol 13(1), 98-105.—Studies sexual arousal by considering the position of the viewer and the way the body of the other person is presented. Data is assembled from the author's experiences, interviews with prostitutes and nightclub performers, and 20 readers' reactions to a draft of the article. Issues considered include revelation-concealment, aliveness-deadness, and objectness and tenderness positions. Sexual arousal is related to the perception of body parts which refer the observer to the whole body.—*R. Tomasko.*

680. Dank, Barry M. (U Wisconsin) **The development of a homosexual identity: Antecedents and consequences.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 423-424.

681. Dean, Dwight G.; Braito, Rita; Powers, Edward A. & Bruton, Brent. (Iowa State U) **Cultural contradictions and sex roles revisited: A replication and a reassessment.** *Sociological Quarterly*, 1975(Spring), Vol 16(2), 207-215.—Tested the hypotheses of M. Komarovsky (1946) and P. Wallin (see PA, Vol 26:4730) that women pretend inferiority in dating situations. Although the hypotheses were replicated with data from 287 female undergraduates, questions are raised as to the appropriate collapsing of categories of responses and the incidence of pretended inferiority in relation to number of dates. Data from a comparison sample of 318 male undergraduates do not sustain the belief of women's pretensions of inferiority. (15 ref)

682. Gillespie, William H. **Woman and her discontents: A reassessment of Freud's views on female sexuality.** *International Review of Psycho-Analysis*, 1975, Vol 2(1), 1-9.—Discusses Freud's views on female sexuality in relation to the work of W. Masters and V. Johnson, K. Horney, and M. Klein. Topics discussed include the Oedipus complex in women, comparisons with animal sexual development, socially imposed requirements on females, the importance of the clitoris in childhood sexuality, and the impact of parental expecta-

tions on a child's behavior. The anatomical differences between the sexes are considered important as an outward sign of more extensive differences in the reproductive roles assigned by evolution. (22 ref)—R. Tomasko.

683. Horton, Robert L. (Western Michigan U) **An empirical investigation of variation in students' premarital sex standards and behavior.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1385-1386.

684. Ilgen, Daniel R. & Terborg, James R. (Purdue U) **Sex discrimination and sex-role stereotypes: Are they synonymous? No!** *Organizational Behavior & Human Performance*, 1975(Aug), Vol 14(1), 154-157.—B. Rosen and T. H. Jerdee (see PA, Vol 55:Issue 1) questioned the present authors' conclusions and stated that the latters' use of attribution theory and equity theory contribute little or nothing to the understanding of sex-role stereotypes. In the present paper, the authors defend their own conclusions and discuss the difference between an attitudinal construct and a behavior.

685. Jurich, Anthony P. & Jurich, Julie A. (Kansas State U) **The effects of cognitive moral development upon the selection of premarital sexual standards.** *Journal of Marriage & the Family*, 1974(Nov), Vol 36(4), 736-741.—Tested a sample of 160 unmarried college students from 8 different colleges. Using L. Kohlberg's (1969) method of assessing cognitive moral development and questions about premarital sexual attitudes, a strong relationship between these variables was found. Ss with low levels of cognitive moral development chose either traditional morality, the double standard, or permissiveness without affection standard. Those with a moderate degree of cognitive moral development chose permissiveness with affection. Those with a high level of cognitive moral development chose a nonexploitive permissiveness without affection standard. The formulation of premarital sexual standards is discussed, and theoretical implications are drawn.—*Journal abstract*.

686. Moroska, Viola J. (Case Western Reserve U) **Perspectives on fertility control, social influence, and fertility practices among selected low-income women.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 415.

687. Morris, Naomi M. & Sison, Benjamin S. (U North Carolina, School of Public Health, Chapel Hill) **Correlates of female powerlessness: Parity, methods of birth control, pregnancy.** *Journal of Marriage & the Family*, 1974(Nov), Vol 36(4), 708-712. Administered a 5-item powerlessness scale to 2 samples of ever-married women ages 18-44. Guamanians ($n = 765$) encountered in islandwide public health clinics and US White and Black women ($n = 182$) interviewed at home in low income census tracts of 17 cities. Powerlessness directly correlated with parity in all but US Blacks when simultaneously controlling for age education, husband's occupation and family income. There were no differences in powerlessness among all users, users of different methods, and nonusers of contraception. The data do not support the notion that female powerlessness leads to high fertility through nonuse of contraception but are compatible with the hypothesis that high parity generates female powerlessness in some populations. (15 ref)

Journal abstract

688. Nettleton, Carol A. & Cline, David W. **Dating patterns, sexual relationships and use of contraceptives of 700 unwed mothers during a two year period following delivery.** *Adolescence*, 1975(Spring), Vol 10(37), 45-57.

689. Rosen, Benson & Jerdee, Thomas H. (U North Carolina, Graduate School of Business Administration, Chapel Hill) **The psychological basis for sex role stereotypes: A note on Terborg and Ilgen's conclusions.** *Organizational Behavior & Human Performance*, 1975(Aug), Vol 14(1), 151-153. Discusses J. R. Terborg and D. R. Ilgen's (1975) attempt to identify the psychological processes underlying sex-role stereotypes. An alternative theoretical approach, based on a functional analysis of the motivations for discriminatory behavior, is suggested.

690. Sagarin, Edward & MacNamara, Donal E. (City Coll, City U New York) **The homosexual as a crime victim.** *International Journal of Criminology & Penology*, 1975(Feb), Vol 3(1), 13-25.—Studied the homosexual as a crime victim. It is maintained that individuals who engage in homosexual behavior, particularly with partners who had previously been strangers, appear to be victimized with considerable frequency. Failure to report to the police, and the unwillingness of victims or families to relate the matter to homosexuality, make the compilation of statistics difficult. Homicide, aggravated assault (including sexual assault in prison), robbery, blackmail, and extortion are probably committed against homosexuals more often than against other sectors of the population. The fast-changing scene in America, with its diminution of secrecy surrounding homosexuality, may result in greater restraint by the criminal, and at the same time lesser caution on the part of incipient victims, so that the outlook for this type of victimization is clouded.—*Journal summary*.

691. Tipton, Robert M.; Bailey, Kent G. & Obenchain, Janet P. (Virginia Commonwealth U) **Invasion of males' personal space by feminists and non-feminists.** *Psychological Reports*, 1975(Aug), Vol 37(1), 99-102.—Investigated the relationship between attitudes toward the feminine role and personal space in 72 female undergraduates. Ss were classified as either feminists or traditionalists according to Spence and Helmreich's Attitude Toward Women Scale. Other measures were semantic differential scales assessing evaluation, potency, activity, and aggression and personal space approaches to male and female stimulus persons. Traditional women did not differ from feminists in their approach behavior to other females but remained a greater distance from males than did the feminists. Feminists saw themselves as more aggressive and more potent than did the traditionalists.—*Journal abstract*.

692. Vener, Arthur M. & Stewart, Cyrus S. (Michigan State U) **Adolescent sexual behavior in Middle America revisited: 1970-1973.** *Journal of Marriage & the Family*, 1974(Nov), Vol 36(4), 728-735.—A resurvey of the same school system over a 3-yr period, 1970-1973, using an identical measure of adolescent sexuality, shows significant increases in coitus for 14-15 yr olds of both genders. At 15, heavy petting and coitus with 2 or more partners also demonstrated significant increases. It is noted that statements regarding changes in adolescent sexual

activity must specify the level of sexuality under consideration. To use change in coital activity as the sole indicator of change in other levels of sexuality is apparently unjustified. Findings indicate that the new morality is not limited to sexuality, but extends to the broader context of youthful behavior. High correlations were found between sexuality and the use of illicit drugs, alcohol and cigarettes. Heavy involvement in sexual activity was also related to other delinquent acts, as well as to the lack of commitment to traditional institutions. By age 17, the impact of the double standard becomes attenuated. At this age an equivalent percentage of boys and girls reported having experienced coitus. Repeated use of an 8-item index showed similar patterns of responses and correlations with other social-psychological measures.—*Journal abstract.*

693. Whisnant, Lynn & Zegans, Leonard. (Yale U, Medical School) **A study of attitudes toward menarche in White middle-class American adolescent girls.** *American Journal of Psychiatry*, 1975, Aug, 809-814.—Interview data from 35 12-15 yr old premenarcheal and 17-21 yr old postmenarcheal girls suggests that menarche is an emotional event related to the adolescent girl's emerging identity as an adult woman, her newly acquired ability to reproduce, and her changing relationship with her mother. However, our culture tends to ignore the affective importance of menarche and instead conveys the view that it is a hygienic crisis. The need is discussed for developing a socially and culturally appropriate substitute to serve the emotional function that more primitive societies have met with social rituals, thus meeting the psychological needs of the young adolescent girl. Drug & Alcohol Usage

694. Crain, William C.; Ertel, David & Gorman, Bernard S. (City Coll, City U New York) **Personality correlates of drug preference among college undergraduates.** *International Journal of the Addictions*, 1975(Oct), Vol 10(5), 849-856. 3 groups of 90 male college drug users—those expressing a preference for marihuana, amphetamines, or barbiturates—reported on experiences resulting from their drugs, and completed, along with a group of nonusers, the Omnibus Personality Inventory (OPI). On the OPI, nonusers appeared more conventional and conforming than each drug group. Those preferring marihuana were less anxious than any other group, but the most distinctive group was that preferring barbiturates, which appeared the least intellectually inclined and the most emotionally distressed. This group's personality dispositions also seemed generally concordant with the experiences they reported from the drug. *Journal abstract.*

697. Hanson, David J. (Syracuse U) **Norm qualities and deviant drinking behavior.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1373-1374.

698. Hindmarch, Ian; Hughes, Ian & Einstein, Rosemarie. (U Leeds, England) **Attitudes to drug users and to the use of alcohol, tobacco and cannabis on the campus of a provincial university.** *Bulletin on Narcotics*, 1975(Jan-Mar), Vol 27(1), 27-36.—Analyzes the responses of 300 university students to a self-administered questionnaire regarding their attitudes toward alcohol, tobacco, and cannabis. No attitudinal differences were found between users and nonusers of alcohol and tobacco, which were regarded as social drugs. There were significant differences between users and nonusers of cannabis, and between experimental users and more frequent users. As use became more frequent, attitudes toward the drug became more positive. It is felt that the attitudinal separation between users and nonusers is an effective barrier to starting the use of the drug, and that such attitudinal differences between experimental and chronic users explain why individuals do not escalate their use of the drug. (32 ref)—A. S. Kulkarni.

699. Johnson, Bruce D. (Manhattanville Coll) **Understanding British addiction statistics.** *Bulletin on Narcotics*, 1975(Jan-Mar), Vol 27(1), 49-66.—Discusses the drug addiction statistics issued by the British Home Office and the Department of Health and Social Security. Methods of assembling these data are described. Analysis of the figures presented indicates that the official statistics are internally consistent and generally valid. They indicate that a rising problem of heroin addiction between 1962 and 1967 was arrested by the establishment of drug treatment centers in 1968. Since then, legally maintained heroin addiction has been reduced by almost 1/2 because many heroin addicts have been transferred to injectable methadone. There are apparently few "hidden" addicts. 701. Leviton, Harvey S. (Independent School District #273, Edina, MN) **Drug control. Pupil Personnel Services Journal**, 1975, Vol 4(1), 29-34.—Considers the problem of marihuana use by school-age youth and proposes several educational programs to help eliminate the problem.—R. W. Coveri

702. McPeck, Robert W. & Edwards, John D. (Ohio State U) **Expectancy disconfirmation and attitude change.** *Journal of Social Psychology*, 1975(Aug), Vol 96(2), 193-208.—Tested the hypothesis that sources delivering unexpected communications (long-haired males arguing against marihuana usage and seminarians arguing in its favor) would be more persuasive than communicators of expected messages (promarihuana hippies and antimarihuana seminarians). Ss were 85 undergraduates. Greater attitude change for unexpected sources was found only when the message was antimarihuana. Unexpected communicators also were rated as more sincere and honest than expected sources. Possible reasons for the failure of the expectancy effect to hold for promarihuana communications are suggested. (30 ref)—*Journal abstract*.

703. Noll, Alfons. **"Drug abuse and its prevention" as seen by the international legal profession: Report on the XIth International Congress on Penal Law, Budapest, 9-15 September 1974.** *Bulletin on Narcotics*, 1975(Jan-Mar), Vol 27(1), 37-47.—Reports on the work of Section II of the International Congress which considered 5 major topics. The resolutions adopted concerning each topic are given, and the discussions leading up to the adoption are summarized. (a) Nature and trends of drug abuse (3 resolutions, which employ the term "substance abuse" rather than "drug abuse"); (b) Legislation aimed at controlling drug abuse (2 resolutions, including a recommendation that every nation establish a central government office to monitor the effectiveness of drug legislation); (c) Law enforcement (3 resolutions, the discussion emphasizing that prevention depends more on controlling production than on penal sanctions against users); (d) Treatment and rehabilitation of drug offenders (6 resolutions; the need for a multidisciplinary approach was stressed); (e) International drug control (8 resolutions: a proposal for a new, "direct" international control system was rejected). It is felt that the international legal profession at the Congress contributed a number of progressive ideas leading toward a better understanding of the national and international drug problem.—*J. Davis*.

705. Sobell, Linda C. & Sobell, Mark B. (Dede Wallace Mental Health Ctr, Alcohol Programs, Nashville, TN) **Drunkenness, a "special circumstance" in crimes of violence: Sometimes.** *International Journal of the Addictions*, 1975(Oct), Vol 10(5), 869-882. Describes a preliminary investigation into belief systems of the public about interactions between drunkenness and crime. 50 19-75 yr old respondents, randomly selected, were interviewed about their beliefs regarding the "effect of alcohol" along 3 dimensions: control, responsibility, and accountability. Ss were then asked to consider whether being legally drunk when committing a violent crime constitutes a "special circumstance" deserving other than the usual penalty. 3 other possible contributing factors were also examined to determine their relationship to drunkenness as a "special circumstance": premeditation, alcoholism, and recidivism. 2 preliminary

conclusions suggest that (a) many members of the public still view alcohol abuse as an associated criminal offense, and (b) respondents' beliefs about the "effects of alcohol" do not demonstrate a rational consistency in relation to penalty judgments concerning violent crimes committed by drunken individuals. (24 ref)—*Journal abstract*.

706. Tolone, William L. & Dermott, Diane. (Illinois State U) **Some correlates of drug use among high school youth in a Midwestern rural community.** *International Journal of the Addictions*, 1975(Oct), Vol 10(5), 761-777.—A questionnaire study of the correlates of drug use (marihuana, LSD, mescaline, and amphetamines) among 136 rural high school students in a Midwestern community indicated that peer group factors were the most influential in drug-related behavior. Also, Ss from less intact families and whose parents were perceived to use various legal drugs were more prone to drug use. Drug education was seen as not having as significant an impact in differentiating between users and nonusers nor in deterring users from further involvement. It is concluded that drug use is a form behavior learned through peer and family socialization. (20 ref)—*Journal summary*.

710. Volgy, Thomas J. & Quistgaard, Jon E. (U Arizona) **Learning about the value of global cooperation: Role-taking in the United Nations as a predictor of world mindedness.** *Journal of Conflict Resolution*, 1975(Jun), Vol 19(2), 349-376. —As a corollary to R. C. Angel's (1973) measures of world order, this article examines nation-state differences in support for world order as a function of learning through involvement in the United Nations. Differences in national support for world order are analyzed in terms of role-taking and cue-taking in the United Nations. 7 types of roles are identified, based on the degree to which nation-states approximated support for the norms of the organization. Correlational analysis indicates that these roles function as good predictors to variance among nations in their support for world order. Alternatively, nations which could not be classified as taking on a definitive role are hypothesized to be taking cues about the value of global

cooperation from their regional counterparts. This predicted outcome is also supported. Finally, analysis of "deviant" cases indicates that for some nations, both role-taking and cue-taking may be equally salient for supporting world order. (45 ref)—*Journal abstract*.

Group & Interpersonal Processes

711. Batchelor, Thomas R. (Bureau of Research & Evaluation, Div of Planning & Evaluation, Tallahassee, FL) **An application of the variable perspective model in interpersonal conflict resolution.** *Journal of Experimental Social Psychology*, 1975(Jul), Vol 11(4), 389-400. —The perspective model of attitude judgment was used as a basis for making predictions concerning interpersonal conflict. 44 pairs of undergraduate males negotiated an annual wage increase in a simulated labor-management dispute. Ss in pairs negotiated from either same or different perspectives. Psychological perspective was manipulated experimentally by the suggestion of either a narrow or broad range of typical wage increase settlements. As predicted, discrepant perspectives were either facilitative or debilitating to reaching agreement depending on the direction of the discrepancy. Increasing width of perspective by raising upper anchor did not significantly affect the amount of the settlement. The hypothesized dynamic aspects of the perspective model were confirmed in that holding the amount of settlement constant, satisfaction with the settlement was a function of perspective.—*Journal abstract*.

712. Benton, Alan A. (U Illinois, Chicago Circle) **Test anxiety and the bargaining behavior of preadolescent males.** *Journal of Social Psychology*, 1975(Aug), Vol 96(2), 209-219. —Examined the bargaining behavior and types of agreements reached on a competitive allocation problem by 32 pairs of high and low test anxious preadolescent males (Test Anxiety Scale for Children). Dyads composed of same and opposite type test anxious boys were formed and a randomly determined member in each pair passed an arithmetic test which made toys available for play. It was hypothesized that the dyads composed of 2 high test anxious boys would evidence equalitarian tendencies, while those composed of at least 1 low test anxious member would relatively quickly agree to an equity distribution. The former prediction received support. Unexpectedly, however, the dyads with a low test anxious member more often agreed to nonequitable rather than equitable divisions and did so after prolonged, competitive negotiations.—*Journal abstract*.

713. Betz, Michael & Judkins, Bennett. (U Tennessee, Knoxville) **The impact of voluntary association of characteristics on selective attraction and socialization.** *Sociological Quarterly*, 1975(Spring), Vol 16(2), 228-240. —Data from 2 voluntary associations show that organizational characteristics (goal specificity, change orientation, and restrictiveness) were associated with the degree of selective attraction and socialization of attitudes. It is concluded that the organizations studied were more of a means for the support of attitudes held prior to joining than a means for developing or changing attitudes through membership. (29 ref)

714. Bitti, Pio R.; Giovannini, Dino & Palmonari, Augusto. (U Bologna, Istituto di Psicologia, Italy) **A study of the interviewer effect in two person interac-**

tion. *Giornale Italiano de Psicologia*, 1974(Dec), Vol 1(3), 305-315. —Studied the effect of the interviewer's behavior on some behavioral indexes (talking, smiling, and looking) of the interviewees. Each of 8 male and 8 female university students was interviewed 4 times for 3 min about 4 different topics, twice by a male interviewer (once with warm and once with cold behavior) and twice by a female interviewer (also once with warm and once with cold behavior). The judges timed the amount of talking, smiling and looking by Ss at interviewer during the central 2 min of the interview, which had been videotaped. It was hypothesized that Ss would engage in a higher percentage of talking, smiling, and looking in response to the warm interviewer than to the cold interviewer and that this effect would be more evident in response to the opposite sex interviewer. Results verify the hypotheses for only 2 dependent variables (talking and smiling). Hypotheses concerning the different function of gaze in male and female Ss are formulated. (Italian summary) (17 ref)—*Journal abstract*.

715. Brehmer, Berndt. (U Umea, Sweden) **Social judgment theory and the analysis of interpersonal conflict.** *Umea Psychological Reports*, 1975, No 87, 41 p. —Presents a general framework for the application of social judgment theory to the analysis of interpersonal conflicts caused by cognitive differences, a general experimental paradigm for the study of cognitive conflicts, and results of recent studies conducted within this paradigm. The experiments involve a situation where 2 persons who think differently about a given policy task are required to work out agreements for a series of policy decisions. 3 problems were emphasized within the studies: the structure of conflict, sources of cognitive change, and the effects of the policy task characteristics. Overall results show that (a) cognitive conflicts are not resolved; (b) Ss are able to reduce the systematic differences between their cognitive systems during interaction but are prevented from reaching agreement by inconsistency within these systems; (c) Ss change their cognitive systems to adapt to the task; and (d) the structure of S's policies and agreements is affected by task characteristics and structure. It appears that cognitive factors in themselves are sufficient to explain certain forms of conflict, as well as why conflicts are not resolved, and that future research will not only have to consider the persons in conflict, but also the nature of the task facing them. (71 ref)—*Journal abstract*.

716. Brenner, Sten-Olof & Hjelmquist, Erland. **Verbal interaction in dyads I: Intensive process analysis of interactions.** *Göteborg Psychological Reports*, 1974, Vol 4(24), 28 p. —Suggests the theory of M. A. Halliday (1973) as a base for a model of verbal interaction in dyads with regard to the function and form of the speech process and applied to data. Ss were 8 teacher candidates with extreme characteristics of intelligence, verbal competence, and emotional flexibility-rigidity. It was found that function and form were highly intercorrelated as predicted by the model and that the speech process in terms of speech quality was structured over time on macrosyntagmatic level. The structure was characterized by complementarity rather than consistency or adjustment. The change in level of speech quality showed a tendency to be related to intelligence and verbal

competence, while level of speech quality was negatively related to flexibility. (31 ref)—*Journal abstract.*

717. Brenner, Sten-Olof & Hjelmquist, Erland. **Verbal interactions in dyads II: Process analysis of interactions.** *Göteborg Psychological Reports*, 1974, Vol 4(25), 31 p.—Studied 4 verbal interactions resembling normal conversation with regard to how the interacting persons were influencing each other with respect to syntactic, cognitive, and affective quality. The interacting persons were equal in intelligence and verbal competence but differed as much as possible in emotional flexibility-rigidity. Ss were 8 teacher candidates. The cognitive and affective quality of the sender's previous messages tended to influence the syntactic quality of the receiver's following messages. A tendency to a systematic difference in degree of influence was found between persons different in intelligence, verbal competence, and emotional flexibility-rigidity. These variations were in accordance with B. Bernstein's (1973) theory of speech codes. (18 ref)—*Journal abstract.*

718. Brenner, Sten-Olof & Hjelmquist, Erland. **Verbal interaction in dyads III: The effects of the interactions.** *Göteborg Psychological Reports*, 1974, Vol 4(26), 11 p.—Describes an investigation of the relations between the person characteristics, the characteristics of the interactive process, and the subjective experience of the interaction (as measured by a semantic differential) in verbal dyadic interaction. Ss were 8 teacher candidates from a preschool teachers college, selected to represent extremes of the person characteristics intelligence, verbal competence, and emotional flexibility-rigidity. A psychologically meaningful pattern was found that indicated both direct and indirect relations between person characteristics and semantic ratings (in the latter case through process characteristics). Intelligence or verbal competence implied a high level of speech complexity, while flexibility led to an independent speech process. These personality characteristics resulted in an evaluation of the process as elaborated. —*Journal abstract.*

723. Jacobson, Marsha B. (U Dayton) **Dichotomous choices on life-dilemma problems, subjective expected utility, and the group shift effect.** *Social Behavior & Personality*, 1975, Vol 3(1), 71-80.—40 male and 40 female undergraduates responded to risk and caution life-dilemma problems in either a group discussion or a life-dilemma problems in either a group discussion or a control procedure. Before and after experimental treatment, Ss filled in a questionnaire involving whether or not the character in the dilemma should take the risk, the

lowest probability they would accept before recommending to the character that he take the risk, and utilities and subjective probabilities of the various outcomes within the dilemmas. It was found that, while the discussion condition yielded shifts on the "lowest probability" question, only very meager shifts were found on the dichotomous "yes-or-no" question, suggesting that it may be difficult to generalize the results of group shift research to real-life groups who must make decisions on a yes-or-no basis. In addition, it was found that the behavioral decision theory concept of subjective expected utility was very accurate in predicting the Ss' dichotomous choices on the dilemmas.—*Journal abstract.*

724. Kahan, James P. & Rapoport, Amnon. (U Southern California) **Decisions of timing in conflict situations of unequal power between opponents.** *Journal of Conflict Resolution*, 1975(Jun), Vol 19(2), 250-270.—Notes that games of timing constitute a subclass of 2-person, zero-sum, infinite games, where the problem facing each player is not choosing what course of action to take, but rather deciding when to take a prespecified action. The present study is an extension of previous research on games of timing with complete information (noisy duels) and equal accuracy functions, to noisy duels with unequal accuracy functions. The game-theoretic solution of this class of games, which has been recently derived, is briefly presented. 10 pairs of male undergraduates participated in 2 sessions each in a computer-controlled noisy duel experiment. Each pair played 256 duels in which both the accuracy functions and the starting number of bullets were varied systematically. Results are analyzed and discussed in terms of predictions derived from the game-theoretic solution. A major finding was a significant change in mean firing probabilities toward optimality from the 1st to the 2nd session.—*Journal abstract.*

725. Kelling, George W. (U Colorado) **The prediction of the outcome of personal arguments of heterosexual couples: An experimental field study.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1359-1360.

726. Knowles, Eric S. (U Wisconsin, Green Bay) **Group risk taking shifts with a payoff response mode.** *Journal of Social Psychology*, 1975(Aug), Vol 96(2), 297-298.—Studied group risk-taking shifts (GRTS) when Ss respond to the Choice Dilemmas Questionnaire through different response modes—either by setting the probability level of success or the level of payoff at which they would take a risk. Significant GRTS were found for both response modes, thus demonstrating the generality of GRTS.

727. Komarovskiy, Mirra. (Barnard Coll) **Patterns of self-disclosure of male undergraduates.** *Journal of Marriage & the Family*, 1974(Nov), Vol 36(4), 677-686.—Reports patterns of self-disclosure of male college seniors to each parent, siblings, and closest male and female friends. 62 males were randomly selected from the senior class of an ivy league college. Having filled out a 56-item self-disclosure questionnaire, Ss were interviewed about their motivation for disclosure and reserve. Results bear upon generational, kinship, and sex patterns of communication. Some findings are consistent with earlier studies of self-disclosure (i.e., higher disclosure to

mother than to father and to peers than to parents), whereas others appear to reflect some recent changes in male-female relationships (i.e., the female, rather than the male, friend emerged as the preferred confidante).—*Journal abstract.*

728. **Krain, Mark.** (U Minnesota) **Organizational and interactional aspects of developmental processes in the formation of pre-marital dyads.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 883.

729. **Krohn, Freddie.** [Proxemics.] (Danh) *Psykologisk Skrifserie*, 1973, No 4, 36-49.—Discusses theories on proxemics, a concept developed by E. T. Hall. Hall measured proxemic reaction in terms of distance in meters; Krohn used the concept of the "bubble" (i.e., ambient area desired by an individual in which he wants to operate freely).

730. **Lawler, Edward J.** (U Iowa) **The impact of status differences on coalitional agreements.** *Journal of Conflict Resolution*, 1975(Jun), Vol 19(2), 271-285.—Investigated the impact of status differences between subordinates and face-to-face coalition negotiations on insurgent coalitional action. The effects of these variables were examined in stratified groups, where a leader established inequitable pay-rates and subordinates could coalesce and destroy a portion of the leader's outcomes. Male undergraduates were Ss in 36 triads, each consisting of 2 experimental Ss and a confederate. Results show that status differences (as opposed to status similarity) undermined the sense of common interests between subordinates and reduced the severity of coalitional action against the leader. Face-to-face negotiations engendered a more cautious approach to coalition negotiations and also reduced the severity of insurgent action. Results suggest that status differences pose an "organizational problem" for subordinates attempting to mobilize action against a leader. (18 ref)—*Journal abstract.*

731. **London, Manuel.** (U Illinois, Champaign-Urbana) **Effects of shared information and participation on group process and outcome.** *Journal of Applied Psychology*, 1975(Oct), Vol 60(5), 537-543. Investigated the effects of information heterogeneity within different levels of participative decision making. Differences between heterogeneous and homogeneous groups in process and outcome variables were predicted to depend upon the nature of the task demands. The impact of anticipated participation on the effectiveness of group brainstorming was also studied. Data were gathered from 24 3-person groups of engineering students participating in a simulation involving nuclear power plant siting. Results indicate that heterogeneity of information may lead to process losses in all stages of decision making. Few significant differences in brainstorming effectiveness were found between levels of anticipated participation. (16 ref) *Journal abstract.*

732. **Mathews, Byron A.** (U Maryland, Baltimore) **Availability of communication and cooperative problem solving in dyads.** *Psychological Reports*, 1975(Aug), Vol 37(1), 119-123.—Studied the initial acquisition of a simple 2-person response under 3 voice communication conditions: free communication, cost communication, and no communication. Ss were 42 male undergraduates. All 7 pairs in both the free and no communication

conditions successfully acquired the cooperative response; however, 4 of the 7 dyads in the cost communication group did not. Among pairs that acquired the response, speed of acquisition did not differ by communication condition. An explanation in terms of the effect of cost on communication pattern is suggested for the unanticipated high failure rate among pairs in the cost communication condition.—*Journal abstract.*

734. **Perju-Liceanu, Aurora.** (Academiei de Științe Sociale și Politice, Inst de psihologie, Bucharest, Romania) [Cognitive role differentiation in dyadic problem solving.] (Romn) *Revista de Psihologie*, 1973, Vol 19(1), 55-68.—Administered the Bruner, Goodnow and Austin test to Ss in 10 dyads in order to investigate thinking strategies. Results indicate that the differentiation of cognitive roles in problem solving groups is an expression of in-group dynamics. Cognitive role differentiation induces, when the dyadic partners are cognitively compatible, a decrease in performance time if they use written messages. This process is discussed in terms of group composition and organization. (English summary) (20 ref)—*C. Făcăoaru.*

735. **Pruitt, Dean G. & Lewis, Steven A.** (State U New York, Buffalo) **Development of integrative solutions in bilateral negotiation.** *Journal of Personality & Social Psychology*, 1975(Apr), Vol 31(4), 621-633.—Conducted 2 studies of bilateral negotiation with a total of 174 male undergraduates to reveal the conditions under which bargainers reach agreement involving high joint profit. Results suggest the importance of 3 approaches to negotiation: (a) the distributive approach, which reduces joint profit; (b) the heuristic trial-and-error approach, which enhances joint profit; and (c) the information exchange approach, which enhances joint profit when adopted by bargainers with high cognitive complexity. Bargainers who started with a problem solving orientation tended to adopt one of the latter 2 approaches. The most integrative solutions appeared to be developed by dyads whose members had this orientation together with high and somewhat inflexible limits or levels of aspiration.—*Journal abstract.*

736. **Spielman, Rima R.** (Hofstra U) **Identity and interpersonal distance.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 416-417.

738. **Wlewiorowski, Krzysztof.** (Nowowiejski Mental Hosp, Warsaw, Poland) **Information, communication and productivity in conditions of team work.** *Polish Psychological Bulletin*, 1975, Vol 6(2), 95-100.—Notes that strategy choice and hence the amount of individual contribution to a team's output should depend on the psychophysical cost of this contribution and on payoff. Various studies of abstract interest conflict have shown, however, that irrespective of the payoff matrix a strategy favoring the team rather than the individual tends to be chosen more frequently when intragroup communication

is possible as well as feedback information on past choices. The productivity of team work should therefore be raised with introduction of communication and information as to level of performance. The present study, with 75 female 16-18 yr old students, was designed to verify this hypothesis. Recorded was the productivity of a team in conditions of simulated team work (a) with neither information nor communication, (b) with information, or (c) with communication. Results show that introduction of feedback information resulted in a growth of productivity. (18 ref)—*Journal abstract*.

739. Wilson, John P. & MacMurray, Val D. (Boston U, Law School) **Interdisciplinary education: Lowering the barriers to effective learning.** *Educational Research*, 1974(Nov), Vol 17(1), 27-33.—Evaluated 2 graduate/professional interdisciplinary groups engaged in exploring problems related to health. Results suggest that the process of group formation involves solving problems of (a) acceptance (i.e., a supportive group climate); (b) data flow, or the sharing of attitudes and information among group members; (c) goal formation (i.e., the selection and accomplishment of tasks); and (d) the control processes by which tasks are assigned internally. Both groups solved the 1st 2 problems but failed with the others. Changes in group orientation, structure, and product are suggested. (15 ref)—*J. B. Francis*.

Social Perception & Motivation

741. Adams, Gerald R. & Huston, Ted L. (Pennsylvania State U) **Social perception of middle-aged persons varying in physical attractiveness.** *Developmental Psychology*, 1975(Sep), Vol 11(5), 657-658.—Presented 6 pictures of middle-aged persons varying in attractiveness to 90 married graduate students and 54 married elderly females. Results support the hypothesis that physically attractive middle-aged persons are judged in more socially desirable terms, and that the elderly hold a stronger physical attractiveness stereotype than young adults.

742. Bailey, Roger C.; Finney, Phillip & Helm, Bob. (East Tennessee State U) **Self-concept support and friendship duration.** *Journal of Social Psychology*, 1975(Aug), Vol 96(2), 237-243.—100 undergraduates who were members of friendship dyads of short or long acquaintance made intelligence attributions for self and friend, and predicted their rating by the friend. Comparisons between these perceptions and "actual" intelligence (Otis-Lennon Mental Ability Test) suggest that self-concept support is a more reliable feature of friendship than is perceived similarity, or "actual" similarity, or even similarity between friends' self-concepts. The role of perceived similarity appears to diminish as friendship persists, whereas the role of perceived self-concept support takes on added psychological significance for enduring friendships. (17 ref)—*Journal abstract*.

743. Bickman, Leonard & Green, Susan K. (Loyola U, Chicago) **Is revenge sweet? The effect of attitude toward a thief on crime reporting.** *Criminal Justice &*

Behavior, 1975(Jun), Vol 2(2), 101-112.—A confederate interacted with shoppers in a supermarket in a friendly, or rude manner. She then shoplifted an item in full view of each shopper. 163 shoppers' reporting of the crime was not affected by the interaction, suggesting the act of reporting was not one of retribution for the S. Other factors that may influence crime reporting are discussed, as well as possible reasons why results of this study conflict with previous role playing findings. *Journal abstract*.

744. Bryant, Nigel J. (U Wales Inst Science & Technology, Cardiff) **Petitioning: Dress congruence versus belief congruence.** *Journal of Applied Social Psychology*, 1975(Apr-Jun), Vol 5(2), 144-149.—"Hip" and "straight" male Es (a student and a lecturer) asked 240 passersby, who were also classified as "hip" or "straight," to sign a petition. Each E received more signatures from Ss of like dress, only when the petition was neutral. There were no significant differences between the Es or Ss for the 2 politically stronger petitions. It is proposed that dress congruence will override belief congruence only when the beliefs involved are of little significance to the S.—*Journal abstract*.

745. Clore, Gerald L.; Wiggins, Nancy H. & Itkin, Stuart. (U Illinois, Champaign) **Gain and loss in attraction: Attributions from nonverbal behavior.** *Journal of Personality & Social Psychology*, 1975(Apr), Vol 31(4), 706-712.—In a series of videotaped conversations with a male, an actress performed nonverbal behaviors previously scaled for warmth. Taped segments were spliced together to form cold-warm, warm-warm, warm-cold, and cold-cold scenarios. 180 female and 158 male college students made ratings of (a) the male recipient's attraction to the female, (b) her attraction to the male, and (c) the male's attraction to her. Clear gain (cold-warm > warm-warm) and loss (warm-cold < cold-cold) effects were found in ratings of the male recipient's attraction to the female and not in the other 2 sets of ratings. These gain-loss effects, based on attributions from nonverbal behavior, did not depend upon a stimulus contrast or on perceptions of the female as discerning. Rather they depended on beliefs that the male recipient would respond affectively to the gain and loss of warmth from the female. (17 ref)—*Journal abstract*.

746. Earle, William J. (Long Island U) **Do feelings cause actions? Philosophy & Phenomenological Research**, 1975(Jun), Vol 35(4), 540-548.—Presents examples to support the argument that individuals do not always act upon feelings. It is concluded that only acts—not feelings—can be objects of moral appraisals.

747. Fabricius, Hanne. [Proxemic behavior in research situations.] (Danh) *Psykologisk Skriftserie*, 1973, No 4, 50-59.—Studied reactions of laboratory Ss to invasion of their personal space. Ss were observed by TV and debriefed after the experiments. The S was placed on a spot, with 3 concentric circles around it, each 20 cm apart, and verbally indicated when the E came too close. He also determined the most comfortable distance. It was expected that Ss would retreat when the E closed in. Results do not support this expectation. In an experiment in Venice, Italians, contrary to expectations, had no greater tolerance for close approach than was

found for Danes in 2 experiments in Copenhagen.—S. Adams.

748. Fischer, Robert D. (Michigan State U) **Unusual behavior and the attribution of responsibility.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1371.

750. Harris, Mary B.; Benson, Sheldon M. & Hall, Carroll L. (U New Mexico) **The effects of confession on altruism.** *Journal of Social Psychology*, 1975(Aug), Vol 96(2), 187-192.—To test the hypothesis that confession serves to reduce guilt and thus decrease subsequent altruism, 74 adult men and 99 adult women, alone or accompanied by other men and women, were observed entering or leaving a Catholic church during confession hours and asked to donate to the March of Dimes. Both the number of people donating and the amount given were recorded. Ss were significantly more likely to donate prior to confession, and men gave significantly more money prior to than after confession. Women, however, donated larger amounts postconfession. Men and women were significantly more likely to donate when with a woman than when alone. Results suggest that confession may serve to reduce altruism, at least for men, and that the presence of a woman may serve to increase it, at least for women.—*Journal abstract*.

751. Harvey, John H.; De Mott, Sandra; Murray, Lesly & Yasuna, Amy. (Vanderbilt U) **Attribution of freedom in a persuasive communication situation.** *Social Behavior & Personality*, 1975, Vol 3(1), 27-35.—Conducted a study with 40 female college students to investigate variables which affect a communicator's attribution of freedom to a communicatee. A communicator delivered a communication to a communicatee who reacted either favorably or unfavorably. Further, the communicator was expected to have to deliver a subsequent communication either to the same communicatee or to a different one. As predicted, greater freedom was attributed to the communicatee (a) when the reaction to the communication was favorable than when it was unfavorable and (b) when a subsequent communication was to be directed toward the same communicatee than when it was to be directed toward a different one. Findings are discussed in terms of a person's need for compliance and the role of the attribution of freedom in serving this need. The study also provided evidence about the relationship between the attribution of freedom and liking. (16 ref)—*Journal abstract*.

752. Hewitt, Jay & Goldman, Morton. (U Missouri, Kansas City) **Effectiveness of various reactions to a hostile attack.** *Journal of Social Psychology*, 1975(Aug), Vol 96(2), 245-253. 45 undergraduates viewed a videotape in which 1 person expressed inappropriate and angry criticism toward a 2nd individual. The latter then replied in 6 different ways. Ss saw all replies and rated and characterized the repplier after each. A replication employed different actors and a slightly modified content for each reply. Regardless of changes in actors, the specific content of each reply, or the dependent variable, the repplier was seen in the most favorable light when he refuted the various criticisms made by the assailant in a calm, friendly, and courteous tone of voice.

It is speculated that a speaker's rapport with an audience after being attacked may depend on (a) the degree to which he can successfully defend his own position, (b) the degree to which he treats his assailant in a courteous and friendly manner, and (c) the degree to which he tries to establish good relations with his assailant.—*Journal abstract*.

753. Honig, Jeffrey H. **The dining scene: Passage through New York City's prestige international restaurant: A sociological interpretation.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 871.

754. Karabenick, Stuart A.; Lerner, Richard M. & Beecher, Michael D. (Eastern Michigan U) **Helping behavior and attitude congruence toward capital punishment.** *Journal of Social Psychology*, 1975(Aug), Vol 96(2), 295-296.—Assessed helping behavior of undergraduates who approached a male or female confederate holding a large sign supporting or opposing capital punishment. Data from the coding of 498 interactions with the confederate indicate no relationship between helping behavior and attitude congruence since the S's Attitude \times Confederate's Attitude interaction was not significant.

755. Karylowski, Jerzy. (U Warsaw, Inst of Psychology, Poland) **Altruism and interpersonal attraction as function of perceived self-partner similarity and self-esteem.** *Polish Psychological Bulletin*, 1975, Vol 6(2), 63-71.—Conducted an experiment with 112 17-19 yr old female students to test 2 hypothesis: (a) Attraction to a partner perceived as similar to the self correlates positively with S's self-esteem; no such relationship exists with respect to a partner perceived as dissimilar to the self. (b) An altruistic motivation is stronger in relation to a partner perceived as similar to the self than in relation to a self-dissimilar partner. A battery of tests and questionnaires was administered to Ss to measure their self-esteem, likes and dislikes, and attitudes toward a typical peer. The test situation, in which S had to demonstrate altruism toward her partner, was manipulated by E so that the partner was similar or dissimilar to the S. Results of posttest evaluations and questionnaires support both hypothesis. (17 ref)—B. McLean

756. Kimble, Charles E. (U Texas, Austin) **The effects of acquaintanceship, disclosure level, and attributional variables on attraction and self-disclosure.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 862.

757. Leavitt, Clark & Kaigler-Evans, Karen. (Ohio State U) **Mere similarity versus information processing: An exploration of source and message interaction.** *Communication Research*, 1975(Jul), Vol 2(3), 300-306.—Combined a person-perception type of study with a measurement of source effect on message acceptance. 32 undergraduate females were asked to rate their degree of agreement with a series of opinions concerning clothing style. Results suggest that widespread communication nets are more effective than mere similarity, and that people learn more from strangers than friends. The hypothesis that greater similarity leads to greater agreement is concluded to be false.—R. Tomasko

758. Levine, John M. & Valle, Ronald S. (U Pittsburgh) **The convert as a credible communicator.** *Social Behavior & Personality*, 1975, Vol 3(1), 81-90.—Investigated reactions to an antialcohol communica-

tion delivered by convert and nonconvert communicators to 56 undergraduates. In 4 convert conditions the communicator was presented as a former alcoholic. The convert's communication was either Personal (1st-person pronouns) or Impersonal (3rd-person pronouns). Compared with Ss' current alcohol consumption, the convert's consumption at a comparable time in life had been either Similar or Extreme. In a control condition (No Convert Impersonal), a life-long teetotaler presented a message identical with that given in the Impersonal Convert conditions. Overall evaluations of the communicator and communication, as well as ratings of message persuasiveness, were significantly more favorable in all 4 convert conditions than in the No Convert Impersonal condition. Within the convert conditions, ratings consistently were more favorable in the Personal than in the Impersonal, and in the Extreme than in the Similar, conditions. Several additional variables which may importantly affect convert communicator credibility are discussed.—*Journal abstract.*

759. Marcus, Mary G. & Hakmiller, Karl I. (U Connecticut) **Effects of frequency, duration of study trial, and total duration of exposure on affective judgments.** *Psychological Reports*, 1975(Aug), Vol 37(1), 195-200.—Studies of frequency and duration of exposure of stimuli have traditionally been factorial, resulting in confounding among the parameters of frequency, duration of study trial, and total duration of exposure. The present study attempted to separate the effects of these variables on affective ratings. 60 male and female undergraduates served as Ss. The stimuli were slides of female nudes. There were 3 comparison conditions, each of which was itself a within-Ss design in which 2 levels of 2 variables were established and repeated measures made for a given S. Ss viewed the slides and then rated them on attractiveness. Although sex differences were found, overall results indicate that, if total duration of exposure is held constant, no changes in judgments of attractiveness occur whereas, if total duration increases and duration of study trial or frequency increases concurrently, increases in ratings of attractiveness, or affect, will occur.—*Journal abstract.*

760. Matusiewicz, Czeslaw. (Adam Mickiewicz U, Poznan, Poland) **Values or needs? How situations affect the course of human behavior.** *Polish Psychological Bulletin*, 1978, Vol 6(2), 101-107. Posits that one of the approaches to the problem of behavior-channeling factors is in terms of needs and values. Values can be treated as the deprecation of needs (J. Henry, 1959), as a cathexis object in relation to needs, which implies the diosyncrism of needs and values (A. H. Maslow, 1959), or as a regulative factor in the selection of needs and means of the latter's satisfaction (J. Szczepanski, 1963). The author aligns himself with the latter and modifies it by conceding the role of the situational factor. Values are viewed as the situationally determined criteria of goal selection. The most crucial elements of the situation which influence the adoption of a particular value are proposed as: (a) the subjective importance of the situational object, (b) awareness of the interdependencies between the elements of the situation, (c) differences between the elements of the situation, (d) individual desires, expectations, attitudes to others, (e) individual capacities. (23 ref) *Journal abstract.*

762. McGinley, Hugh; Lefevre, Richard & McGinley, Pat. (U Wyoming) **The influence of a communicator's body position on opinion change in others.** *Journal of Personality & Social Psychology*, 1975(Apr), Vol 31(4), 686-690.—Investigated whether, while discussing his or her views, a communicator who exhibits limb-outward or open body positions would effect greater opinion change in an addressee than a communicator who exhibits limb-inward or closed body positions. 96 female college undergraduates whose attitudes were premeasured perused an attitude questionnaire of a female student and then viewed pictures that were taken of her while she discussed her beliefs. Some Ss viewed open body position pictures of the communicator, while others viewed closed body position pictures. Retesting of the Ss' opinions showed a change toward the communicator's viewpoint for Ss who had viewed "open" pictures compared with Ss who had viewed "closed" pictures of the communicator ($p < .01$).—*Journal abstract.*

763. Olszewska-Kondratowicz, Agnieszka. (U Warsaw, Inst of Psychology, Poland) **Self-image as a regulator of tactical variations in ingratiation.** *Polish Psychological Bulletin*, 1975, Vol 6(2), 73-79.—Investigated the effects of self-esteem, sex, and behavior awareness on frequency and type of ingratiating behaviors. During Stage I, a Q-sort technique was used to measure 224 17-18 yr old students' self-esteem in order to assign them to groups of high, medium, and low self-evaluation. In Stage 2, Ss revealed preferences among 4 ingratiation techniques: conformity, positive self-presentation, self-depreciation, and other-enhancement. Preferences for specific tactics of ingratiation and their configurations, as well as overall tendency to employ ingratiation, varied with level of S's self-esteem. Some tactics occurred conjointly; others seemed to be mutually exclusive. Self-depreciation and partner-enhancement were viewed as complementary tactics, whereas conformity and self-deprecation seemed to develop from similar psychological bases. The stability of the discovered hierarchies of behavior is taken as confirmation of the view that both conscious and unconscious behaviors belong to a common family of behaviors.—*Journal abstract.*

764. Page, Richard A. (U Rochester) **The effects of self-esteem and sex on attributions by actors and observers regarding the causes of success and failure.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 863-864.

765. Parker, Howard A.; Perry, Ronald W. & Gillespie, David F. (U Hartford) **Prolegomenon to a theory of attitude-behavior relationships.** *Pakistan Journal of Psychology*, 1974(Dec), Vol 7(3-4), 21-39.—To resolve the discrepancy between attitude and behavior, it is theorized that a number of intervening variables need to be considered, such as importance of an attitude object, perceived consequences of not taking action, the history of an individual's involvement, and the number of issues evaluated. Survey data of 221 households provided support for the hypothesis that action against air pollution is related to the degree of importance of the air

pollution issue. A composite index of the importance included the individual's ranking of air pollution as well as the extent of agreement among his friends and workmates. Air pollution behavior was scaled in terms of commitments—signing a petition, circulating a petition, giving money, etc. (31 ref)—M. Akhtar.

766. Patterson, Kay; Helmreich, Robert & Stapp, Joy. (U Texas, Austin) **Likability, sex-role congruence of interest, and competence: It all depends on how you ask.** *Journal of Applied Social Psychology*, 1975(Apr-Jun), Vol 5(2), 93-109.—572 female and 385 male undergraduates were shown 1 of 4 videotaped versions of a male or female stimulus person (SP) being interviewed, the SP's being Competent or Incompetent and Masculine or Feminine in their interests. All Ss were asked to rate the SP's likability on an objective questionnaire, those in one condition (Standard) immediately after viewing the tape, and in another (Projective) after first having responded to a series of open-ended, TAT-like questions about the SP. In the Standard condition, the major results were 2 highly significant effects—Competent SPs were liked better than Incompetent ones, and the Masculine Competent SPs more than their feminine counterparts. Several changes occurred in the Projective condition. Only profeminist female Ss continued to prefer the Masculine Competent female SP to the Feminine Competent, the other group reversing their ratings. In response to the male SPs, profeminist male Ss in the Projective condition preferred both masculine SPs to the feminine ones and, in comparison with other groups, exhibited a reduced competency effect.—*Journal abstract*.

767. Pieszko, Henry. (California State Coll, Dominguez Hills) **The structure of role perception: A comparison of two methods of assessment.** *Social Behavior & Personality*, 1975, Vol 3(1), 91-100.—To test the stability of role perception, multidimensional scaling analyses were applied to family role constructs based on data from 2 methods which differed significantly in terms of the types of judgments of stimulus dissimilarity which were required. Members of 2 undergraduate psychology courses were Ss. In the present application, demonstrating stability of role perception reduced essentially to the problem of showing the statistical equivalence of 2 presumably multinormal data matrices. The problem was complicated not only because of the existence of individual differences in perceptual style, but also because of the possible interaction of these with the method used for the assessment of S judgments. An attempt was made, therefore, for both a statistical comparison as well as pattern comparisons, after the data were factored along the lines of Tucker-Messick. (16 ref) —*Journal abstract*.

769. Rule, Brendan G.; Dyck, Ronald; McCra, Marilyn & Nesdale, Andrew G. (U Alberta, Edmonton, Canada) **Judgements of aggression serving personal versus prosocial purposes.** *Social Behavior & Personality*, 1975, Vol 3(1), 55-63. 30 male university students (Exp I) and 253 11th and 12th graders (Exp II) read a

transcript of an interview including a description of an aggressive incident. The aggressor was attractive or unattractive, and his intentions in aggressing were either to hurt the victim (hostile aggression), to return a wallet to its rightful owner (social-instrumental), or to keep the wallet for himself (personal-instrumental). Ss evaluated the aggressor on several dimensions. Results of both studies indicate that the manipulations were successful. Moreover, in both studies Ss evaluated the attractive aggressor as more right and less deserving of punishment than the unattractive aggressor. Both groups of Ss judged an aggressor who hit for prosocial instrumental reasons as more right and less deserving of punishment than an aggressor who hit for personal reasons. For university students both hostile and personal-instrumental aggression were evaluated similarly. However, high school Ss evaluated an aggressor who hit for personal-instrumental reasons as more wrong and deserving of more punishment than an aggressor who hit for hostile reasons.—*Journal abstract*.

770. Schlottman, Robert S.; Shore, Sandra L. & Palazzo, Richard F. (Oklahoma State U) **The effects of factual vs. emotional wording in printed accounts of violence on aggression.** *Journal of Social Psychology*, 1975(Aug), Vol 96(2), 221-227.—90 male undergraduates, 45 of whom had been previously anger-aroused by insult, participated in an ostensible ESP experiment supposedly involving electric shock for incorrect responses after being exposed to printed accounts containing nonviolent, factual-violent, or emotional-violent material. Ss exposed to emotional violence gave significantly higher shocks than Ss exposed to factual violence. This difference was attributable largely to Ss receiving prior insult and not to Ss in the no-insult condition. Insulted Ss gave significantly lower shocks than noninsulted Ss, and in fact decreased their shock level in comparison to their pretest scores, but insulted Ss subsequently exposed to emotional violence did not decrease their shock level as much as Ss who were insulted and exposed to factual violence.—*Journal abstract*.

771. Schofield, Leon J. & Oakes, James D. (Hobart & William Smith Coll) **Social-class bias in clinical judgment and recommendation for treatment using the biographical vignette technique.** *Psychological Reports*, 1975(Aug), Vol 37(1), 75-82.—Used an autobiographical vignette technique with 14 mental hospital attendants and 14 college students who rated the severity of emotional problems and recommended various forms of treatment for fictitious individuals. A social-class bias was observed; the lower-class individuals were seen as having a greater need for help than the middle-class individuals, particularly when both were given descriptions of psychotic behavior. However, the recommendation of treatment was not affected by the social class of the individuals. Results are not consistent with those of a recent study by D. Routh and K. King (see PA, Vol 48:7430) which showed middle-class individuals were rated as having a greater need for help than lower-class individuals using a similar vignette technique. (16 ref) —*Journal abstract*.

772. Shaw, Jerry I. & McMartin, James A. (California State U, Northridge) **Perpetrator or victim? Effects of who suffers in an automobile accident on judgemental**

strictness. *Social Behavior & Personality*, 1975, Vol 3(1), 5-12.—After reading of an automobile accident in which the driver and/or bystanders either suffered or did not suffer, 40 male and 40 female undergraduates rated the driver's responsibility for the accident and sentenced him to a jail term. The purpose of this experiment was to contrast 3 theoretical models: defensive attribution, moral salience, and equity. Results indicate that male Ss utilized an equity principle by relaxing their strictness of judgment in terms of time sentenced to jail, when the accident perpetrator himself suffered harmful consequences. Females invoked a moral salience principle in that judgmental strictness increased only when bystanders were harmed. Regardless of sex, Ss expressed a preference for information regarding the personal characteristics of the accident perpetrator as contrasted with information about the environment. This finding is considered in relation to recent developments in attribution theory.—*Journal abstract*.

773. Silverthorne, Colin P. & Mazmanian, Lee. (U San Francisco) **The effects of heckling and media of presentation on the impact of a persuasive communication.** *Journal of Social Psychology*, 1975(Aug), Vol 96(2), 229-236.—Presented a persuasive message to 6 groups of 24 undergraduates each. 3 groups received the message straight, while the other 3 groups received the message with heckling. A 2nd variable, the medium of presentation, was utilized so that 1 group in each of the 2 presentation procedures received either a live, video, or an audio presentation. Results indicate that the message was effective in changing attitudes; however, when the speech was heckled, the message elicited no attitude change. The audio presentation was more effective than both the video and the live presentation. Results are interpreted in terms of distraction theory and media effects. (15 ref)—*Journal abstract*.

777. West, Stephen G.; Whitney, Gayle & Schnedler, Robert. (Florida State U) **Helping a motorist in distress: The effects of sex, race, and neighborhood.** *Journal of Personality & Social Psychology*, 1975(Apr), Vol 31(4), 691-698. 2 experiments investigated the effects of the sex and race of the victim and the racial composition of the neighborhood in which the incident was staged on helping a motorist whose car was apparently disabled. In Exp I, a significant sex of victim effect was obtained: The female victims were helped faster than male victims. A significant Race \times Neighborhood interaction was also obtained, with the Black victims being helped faster in Black neighborhoods and the White victims helped faster in White neighborhoods. The helpers were predominantly male and of the same race as the victim. In Exp II the effects of a 4th variable, proximity to a

college campus, were also investigated. While the effect of sex of victim and the helper-sex bias were replicated, the Race \times Neighborhood interaction was modified by the variable of proximity to college. In locations adjacent to a predominantly Black and a predominantly White campus, the victims of the opposite race were helped faster than victims of the same race. However, in the noncollege neighborhoods, the victims of the same race were helped faster. Whites predominantly helped victims of the same race, while Black helpers did not show a racial bias. Results are discussed in terms of J. A. Piliavin and I. M. Piliavin's (1972) 2-stage model of the helping process. (27 ref)—*Journal abstract*.

778. Wine, Jeri D. (Ontario Inst for Studies in Education, Toronto, Canada) **Test anxiety and helping behaviour.** *Canadian Journal of Behavioural Science*, 1975(Jul), Vol 7(3), 216-222.—Examined children's helping behavior as a function of test anxiety level and evaluative conditions. After taking the Test Anxiety Scale for Children, 72 4th graders completed a task under either evaluative or nonevaluative conditions, and then were given an opportunity to help a younger child with a sorting task. Examination of a significant interaction between anxiety and evaluation revealed that highly test-anxious Ss were most sensitive to the evaluative manipulation, being less likely to help in the evaluative than in the nonevaluative condition. Helping behavior of less anxious Ss did not vary with evaluation. It is suggested that relationships between personality variables and helping behavior should be examined only in combination with clearly specified situational variables. (French summary) (15 ref)—*Journal abstract*.

PERSONALITY

779. Appelbaum, Alan S.; Tuma, June M. & Johnson, James H. (U Texas, Medical Branch, Galveston) **Internal-external control and assertiveness of subjects high and low in social desirability.** *Psychological Reports*, 1975(Aug), Vol 37(1), 319-322.—Investigated the relationship between locus of control and assertiveness in a 2 \times 2 factorial design using 112 undergraduates with high and low scores on the Marlowe-Crowne Social Desirability Scale. It was predicted that internals would be more assertive than externals but that this relationship would hold only for Ss scoring low in social desirability. Internality-externality was assessed by Rotter's Internal-External Control Scale and assertiveness by the Rathus Assertiveness Scale. Internals described themselves as more assertive than externals, but this relationship did not vary with social desirability.—*Journal abstract*.

780. Becker, Ernest. **The denial of death.** New York, NY: Free Press, 1973. xiv, 315 p. \$2.95.—Presents a psychophilosophical analysis of how the idea and fear of death is a primary component of human activity and how most of this activity is designed to avoid the fatality of death. The idea that the fear of death is the primary force behind cultural and scientific endeavors, the importance of the work of Otto Rank in the development of a psychology of death, and the relationship between psychology and religion are examined in detail.

781. Bronberg, Norbert. **Hitler's childhood.** *International Review of Psycho-Analysis*, 1974, Vol 1(1-2), 227-244.—A diagnosis of narcissistic personality with paranoid features, functioning on a borderline personality organization, is made based on data from A. Hitler's adolescence. In childhood he is suggested to have manifested excessive aggression and deficient development of libidinal drives. (55 ref)
782. Chm, Ki-Taek & Campbell, John B. (U Michigan, Inst for Social Research) **Notes on the internal structure of Wrightsman's measure of trustworthiness.** *Psychological Reports*, 1975(Aug), Vol 37(1), 323-330.—The 14-item Trustworthiness subscale of Wrightsman's Philosophies of Human Nature Scale was interspersed in a larger questionnaire completed by 187 undergraduates. Cluster analyses based on males, females, and the total sample were similar, and subsequently factor analysis was performed on the total sample. 24-item dimensions, designated Global Morality and Specific Acts of Honesty, were identified by both the cluster and factor analyses of the total sample. Significant sex differences in mean and/or standard deviation were found for the 2 dimensions but not for the total score. The Wrightsman measure was reducible to an 8-item short form consisting of the 4 marker items for each dimension. Implications for the development of an adequate measure of trust are discussed.—*Journal abstract*.
783. Cosmovici, A. & Mihai, D. (U "Al. I. Cuza," Iasi, Romania) **[Personal sociability.]** (Romanian) *Revista de Psihologie*, 1973, Vol 19(1), 17-27.—Investigated, using a questionnaire and prolonged observations, 3 aspects of sociability: (a) communicativity (the pleasure of communicating), (b) social affinity (the need for society), and (c) altruistic trends. The data revealed that the 1st 2 aspects are sometimes dissociated. In at least 26% of the women Ss, important individual differences in sociability were found, a fact to be taken into account in vocational guidance. Altruistic tendencies are difficult to identify because of the "facade effect." (French summary) (15 ref)—C. Făcioaru.
784. Das, Puranjan; Ravalji, H. R. & Bhowmik, K. L. (Indian Inst of Management, Ahmedabad, India) **On application of Markov chains in predicting diffusion behaviour at macro level.** *Society & Culture*, 1974(Jan), Vol 5(1), 33-38.—Discusses with the use of hypothetical data, an application of the theory of Markov chains for the prediction of innovation diffusion. The inability of the procedure to predict innovation diffusion at the individual level is noted.
785. Dickstein, Louis S. (Wellesley Coll) **Self-report and fantasy correlates of death concern.** *Psychological Reports*, 1975(Aug), Vol 37(1), 147-158.—Administered the author's Death Concern Scale to 185 college females. 3 groups of high ($n = 24$), middle ($n = 25$) and low ($n = 24$) death-concern Ss were selected. These groups were administered the Marlowe-Crowne Social Desirability Scale, the Pearson Novelty-Experiencing Scale, the Mosher Forced-Choice Guilt Inventory, and the Allport-Vernon-Lindzey Study of Values. In addition, Ss took the TAT which was scored for death references, prospective span, retrospective span, themes of illicit sexuality, and themes of punishment. Death concern was positively related to internal sensation novelty seeking, retrospective span, death references, and themes of illicit sexuality, and negatively related to the Theoretical scale on the Study of Values and social desirability. Results provide additional support for the Death Concern Scale. (28 ref)—*Journal abstract*.
786. Everly, George S. (U Maryland) **The dogmatism/externality correlation for college students.** *Psychological Reports*, 1975(Aug), Vol 37(1), 190.—Administered the Rokeach Dogmatism Scale and Rotter's Internal-External Control Scale to 144 male and 175 female undergraduates. As predicted, the Pearson product-moment correlation between dogmatism and externality was stronger for males (0.74) than for females (0.29).
787. Everly, George S. (U Maryland) **The dogmatism/externality correlation for college students.** *Psychological Reports*, 1975(Aug), Vol 37(1), 190.—Administered the Rokeach Dogmatism Scale and Rotter's Internal-External Control Scale to 144 male and 175 female undergraduates. As predicted, the Pearson product-moment correlation between dogmatism and externality was stronger for males (0.74) than for females (0.29).
788. Fairbank, Dianne T. (U Arizona) **The measurement and interrelations of components of authoritarianism in Arizona and Indiana communities.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1358.
789. Gaines, Lawrence S.; Fretz, Bruce R. & Helweg, Gregory C. (U Massachusetts, Boston) **Self-referent language and need for approval.** *Psychological Reports*, 1975(Aug), Vol 37(1), 107-111.—Studied the influence of need for approval and impression value of verbs on the generation of self-referent statements. 52 male undergraduates who varied in need for approval (assessed by the Marlowe-Crowne Social Desirability scale) did not vary in their production of self-referent language except when impression value of the stimuli was also considered. All Ss, including those with low need for approval, responded to stimuli expressing negative impression with fewer self-referent responses. This unexpected result is considered in relation to normative aspects of the need for approval measure in this population.—*Journal abstract*.
790. Gaudry, Eric; Vagg, Peter & Spielberger, Charles D. (U Melbourne, Australia) **Validation of the state-trait distinction in anxiety research.** *Multivariate Behavioral Research*, 1975(Jul), Vol 10(3), 331-341.—Administered the Test Anxiety Scale for Children, the Otis Self-Administering Tests of Mental Ability, Form C, and the A-State and A-Trait scales of the State-Trait Anxiety Inventory (STAI) to 345 female 10th graders and 255 university students. The STAI A-State scale was administered under 1 nonstress and 2 stress conditions to both groups of Ss. A factor analysis of the data for the high school students identified 6 factors: Trait Anxiety; 3 separate State Anxiety factors, corresponding to each of the 3 administrations of the A-State scale; a Reversed-Item factor; and an Ability factor. A similar factor pattern emerged for the university students. Results are interpreted as providing evidence of the importance of situational stress in evoking anxiety states, and strong support for the state-trait distinction in anxiety research.—*Journal abstract*.

791. Glasgow, Russell E. & Arkowitz, Hal. (U Oregon) The behavioral assessment of male and female social competence in dyadic heterosexual interactions. *Behavior Therapy*, 1975(Jul), Vol 6(4), 488-498.—59 male and 59 female undergraduates who were either high (HFD) or low (LFD) in dating frequency were matched with opposite sexed partners in a 2 x 2 design and compared on behavioral, self-report, and partner rating measures of social competence and attractiveness. Neither total frequency nor reciprocal behavioral measures produced any between-group differences. Physical attractiveness discriminated significantly between HFD and LFD groups. The importance of negative self-evaluations was supported in males rather than a social skill deficit hypothesis. By contrast, LFD females seemed characterized by a social skill deficit rather than overly negative self-evaluations. Discussion centers on issues in behavioral assessment and models of social inhibition. (18 ref)—*Journal abstract*.

792. Golden, Charles J. & Golden, Ellen E. (U South Dakota) Resistance to cognitive interference as a function of MMPI profile. *Journal of Consulting & Clinical Psychology*, 1975(Oct), Vol 43(5), 749.—Scored undergraduates for resistance to interference according to their results on the Stroop Color-Word Test and then classified the Ss into 3 groups on the basis of their MMPI profiles. Results of analyses support the hypothesis that resistance to interference, as measured by the Stroop Test, is related to psychopathology and indicate that behavioral tests can be of use to the clinician in understanding and predicting behavior.

793. Gottlieb, Marvin R. (New York U) Toward changing self concept in the classroom: The effect of an inference exercise on the self perception of college students in a basic course in oral communication. *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 616.

794. Groves, David L.; Kahalas, Harvey & Erickson, David L. (Virginia Polytechnic Inst & State U) A multi-frame of reference approach to leisure motivation. *Social Behavior & Personality*, 1975, Vol 3(1), 13-26.—With increased leisure time and ways to spend it caused by increased automation, most individuals must facilitate utilization of their time to satisfy individual needs for proper maintenance of mental health. Therefore, the personality and social psychology of the individual within this setting must be examined critically. Research on this subject has been primarily of a descriptive nature, especially with regard to motivation. The present study, which interviewed a sample of 173 users of public game and forested lands, was undertaken to lay a more quantitative framework for future research. Leisure was examined from a multiframe of reference, so that the changes in motivation and its important formative variables could be isolated with regard to content area and utilized to help individuals clarify their position to satisfy individual needs. Results indicate that emotion and involvement are the common elements that are related to leisure needs and that the relationships among the interacting elements change as the frame of reference shifts. (42 ref)—*Journal abstract*.

795. Groves, David L.; Kahalas, Harvey & Erickson, David L. (Virginia Polytechnic Inst & State U) A

suggested modification to Maslow's need hierarchy. *Social Behavior & Personality*, 1975, Vol 3(1), 65-69.—Since its development, A. H. Maslow's need hierarchy has been criticized and applauded. This hierarchy has been primarily used in the development of theory. Problems in its operational use have been caused by the upper levels in the hierarchy, particularly the self-actualization category. The present paper explores a modification of the upper levels of the need hierarchy based upon the application of power, competition, and achievement to self, as well as the concept of "other directed." (41 ref)—*Journal abstract*.

796. Hakim, Eleanor. Jean-Paul Sartre: The dialectics of myth. *Review of Existential Psychology & Psychiatry*, 1974, Vol 13(1), 1-29.—Discusses Sartre's attempts to integrate his personal life cycle with the historical life cycle and considers the conflicts between aesthetic, ethical, and social commitments. Several of Sartre's literary works are discussed in relation to the facts of his life.

797. Hyde, Janet S.; Geiringer, Eva R. & Yen, Wendy M. (Bowling Green State U) On the empirical relation between spatial ability and sex differences in other aspects of cognitive performance. *Multivariate Behavioral Research*, 1975(Jul), Vol 10(3), 289-309.—Hypothesized that sex differences in field independence and mental arithmetic could be accounted for by sex differences in spatial ability. A battery of 9 tests was administered to a group of 46 female and 35 male undergraduates. Sex-typing did not appear to be strongly related to spatial ability for either sex. There was a possibility of the existence of a field-independence trait independent of spatial ability, particularly among females; however, if such a trait did exist there did not appear to be significant sex differences with respect to it. Factor analysis indicated that tests of spatial ability, field independence, and mental arithmetic emerged together in a spatial ability factor. Sex differences in the factor structure of the 9 measures, most of which typically display sex differences (spatial ability, field independence, mental arithmetic, vocabulary, verbal and nonverbal creativity, femininity, and achievement motivation) were largely the result of differences with respect to a spatial factor. Results support the hypothesis. (43 ref)—*Journal abstract*.

798. Iammarino, Nicholas K. (U Toledo) Relationship between death anxiety and demographic variables. *Psychological Reports*, 1975(Aug), Vol 37(1), 262.—Administered Templer's Death Anxiety Scale to 249 9th graders in 9 different high schools. Females and Ss living with only 1 parent had higher scores than males or Ss living with both parents.

799. James, Muriel. Ego states and social issues: Two case histories from the 1960's. *Transactional Analysis Journal*, 1975(Jan), Vol 5(1), 8-11.—Uses individual and group case studies to illustrate the involvement of multiple ego states when problems are turned into social issues. A decontamination technique for analyzing ego states in reference to social issues is presented.

800. Johnson, Toby. (Mann Ranch Seminars, Ukiah, Ca) The cage of years. *Psychological Perspectives*, 1974(Fal), Vol 5(2), 164-170.—Discusses the tendency to imprison oneself within a fear of death. Religious and

mythical traditions are cited to indicate that wisdom and enlightenment, rather than chaos and despair, emerge from death.

801. Jung, E. (Landesnervenklinik Berlin, W Germany) [Can a contribution to the understanding of the drug problem be made from the point of view of analytical psychology?] (Germ) *Analytische Psychologie*, 1975, Vol 6(1), 12-25.—In the treatment of drug misuse among the young, the therapist begins with the phenomema of intoxication and ecstasy. Some Jungian theorists have pointed to the collective background while they have also described the individual problems of the drug users. Alcohol, which encourages extraversion, is largely integrated into Western cultural patterns, while in the Orient drugs prevail which lend themselves more to introversion. The growing use of such drugs represents the young people's rejection of tolerated and integrated addictive behavior. It is a rejection of an emphasis on extraversion. The evasive element in this behavior is clearly seen in a questionable neglect of extraversion, leading eventually to a refusal to adequately respond to the demands of reality. Introversion and extraversion are no more alternatives than is aggression directed towards the outside or towards the inside in self-destruction. An individual lives and will receive recognition only when he correctly evaluates and applies his energies and abilities.—S. D. Babcock.

802. Kettner, Melvin G. (Private practice, Berkeley, CA) **The ugly duckling complex: A symposium.** *Psychological Perspectives*, 1974(Fal), Vol 5(2), 117-130.—Discusses the reciprocal relationship between inferiority feelings and self-esteem. Inferior behavior tends to reinforce itself, creating an underdog pathology. Concepts of self-actualizing and self-esteem are reviewed.

803. Kuusinen, Jorma & Nystedt, Lars. (U Jyväskylä, Finland) **Individual versus provided constructs, cognitive complexity and extremity of ratings in person perception.** *Scandinavian Journal of Psychology*, 1975, Vol 16(2), 137-142.—Used J. S. Bruner and R. Tagiuri's (1954) concept of implicit personality theory and G. A. Kelly's (1955) theory of personal constructs as a basis for a hypothesis that an individual's own constructs mediate more differentiated perceptions of other people than constructs provided by the E. The hypothesis was tested by using 4 indices of cognitive complexity and 1 index of extremity of ratings to measure differentiation. The individual constructs were derived by using G. A. Kelly's Role Construct Repertory Test. The provided constructs were semantic differential and personality differential scales. Ss were 36 university students. 2 ts were employed to control E effects. The data do not support the hypothesis but showed that differences between individual constructs and provided constructs are dependent upon which criterion is chosen to contrast the 2 types of constructs, which indices are used to measure the chosen criteria, and what type of provided constructs are compared with individual constructs. (28 ref) —*Journal abstract*.

804. Lens, Willy. (Psychologisch Inst. Louvain, Belgium) **Sex differences in attitude towards personal past, present, and future.** *Psychologica Belgica*, 1975, Vol 15(1), 29-33. Administered Nuttin's Time Attitude Scale composed of 19 bipolar adjectives for measure-

ment of attitudes toward one's own past, present, and future to 135 male and 125 female undergraduates. Since previous findings of M. Horner (1970) and A. Fannes (1974) showed higher frequency of fear of success among female students because of the conflict between success and the feminine role, it was hypothesized that female students would have less positive attitudes toward their past, present, and future. Results show that contrary to the hypothesis, female students had more positive attitudes toward their past, present and future than male students. Negative results are interpreted in terms of the possibility that less positive attitudes of female students as reflected in their greater fear of success may be limited to certain aspects of time dimensions without strongly influencing the global outlook.—S. Slak.

805. Loewenthal, Kate. (Bedford Coll, London, England) **Handwriting and self-presentation.** *Journal of Social Psychology*, 1975(Aug), Vol 96(2), 267-270.—Conducted 2 experiments with a total of 11 undergraduates to study the relations between self-concept and handwriting-based inferences about academically relevant traits made by members of the academic population to whom the writers were unknown. There was good interjudge agreement for some traits. Agreement between handwriting judgments and writer self-ratings was significantly reduced when judgments were based on best rather than normal handwriting, suggesting suppression of self-revelation. When asked to do so, Ss successfully conveyed "false" impressions of named traits via handwriting. It is concluded that handwriting can be regarded as a social act; Ss showed knowledge of how it can be modified by situational demands to effect differing kinds and degrees of self-presentation.—*Journal abstract*.

806. Loreto, D. & Tonoli, C. (Hosp Psichiatrico Provinciale, Como, Italy) [Koch's tree test: Some theoretical and applied situations.] (Ital) *Neuropsichiatria*, 1973(Jan-Jun), Vol 29(1-2), 59-64.—Describes some conscious and unconscious aspects of the process of drawing a tree and delineates the symbolic meaning K. Koch (1949) attributed to the task. The end product is seen as fusion of external and internal reality. Since the ability of the S to release his creative potential without generating interfering emotional states is considered important, Koch is criticized for disregarding both drawing skill and the task of drawing in his manual. The value of the intervening dynamics during the task to diagnostic interpretations is emphasized. (English, French, & German summaries)—A. Felice.

807. Mc Cormick, Kathleen & Baer, Daniel J. (Boston Coll) **Birth order, sex of subject and sex of sibling as factors in extraversion and neuroticism in two child families.** *Psychological Reports*, 1975(Aug), Vol 37(1), 259-261.—Using the Eysenck Personality Inventory, Extraversion and Neuroticism scores were obtained for 120 undergraduates from 2-child families. When the effects of birth order and sex of S were examined, a significant interaction occurred for Extraversion, with firstborn males and second born females having higher scores. Higher Neuroticism scores occurred for Ss with opposite-sexed siblings than for those with the same-sexed siblings. Results suggest that extraversion and

neuroticism are influenced by position in the 2-child family.—*Journal abstract.*

808. Meadows, Chris M. (Vanderbilt U, Divinity School) **The phenomenology of joy: An empirical investigation.** *Psychological Reports*, 1975(Aug), Vol 37(1), 39-54.—Constructed the Joy Scale of items which describe the phenomenology of joy. 333 undergraduates were asked to describe a specific instance of joy they had experienced and then to fill out the Joy Scale and the Nowlis Mood Adjective Check List. A factor analysis of the correlations among items on the Joy Scale was done to ascertain whether the hypothesized factors expressing various phenomenological dimensions of joy would be confirmed. The correlations between the Central Joy score and a measure of the Dimensions of Emotion identified the specific aspects of the emotion process (e.g., pleasantness or activation) that were dominant in the affect of joy. Finally, a factor analysis of the Nowlis Mood Adjective Check List data, which were obtained under "joy" instructional sets, demonstrated that Nowlis's original factors were altered appreciably when the instrument was filled out in an almost exclusively positive affective situation. (30 ref)—*Journal abstract.*

809. Moffett, Louis A. (VA Hosp, Psychology Service, Palo Alto, CA) **Sex differences in self-concept.** *Psychological Reports*, 1975(Aug), Vol 37(1), 74-50 male and 50 female undergraduates described their actual and ideal selves on 10 specially selected semantic differential scales. The actual self-concepts were significantly differentiated from the ideal self-concepts, and males described themselves in a more agentic fashion than did the women, thus supporting D. Bakan's (1966) hypothesis.

810. Pittenger, John B. & Shaw, Robert E. (U Arkansas) **Perception of relative and absolute age in facial photographs.** *Perception & Psychophysics*, 1975(Aug), Vol 18(2), 137-143.—Longitudinal series of photographs of faces of 12-19 yr old secondary school students were used to evaluate 90 undergraduates' ability to perceive age. Information in individual stimuli was manipulated by masking out parts of the photographs, while information provided by the relations among stimuli was manipulated by task conditions. The ability to perceive relative age was assessed in 2 tasks requiring Ss to order photographs by age. Absolute age perception was studied in a 3rd task requiring age estimates in years to photographs presented one at a time. While judgments were beyond chance accuracy in all combinations of masking and task conditions, a decrease in either type of information generally produced a decrease in accuracy. (16 ref)—*Journal abstract.*

811. Ramos, Edith. (U Federal Rural do Rio de Janeiro, Brazil) **Adolescent nisei self-image.** *Pakistan Journal of Psychology*, 1974(Dec), Vol 7(3-4), 55-60. Studied 100 adolescents, half males and half females, who were Brazilian by birth but had Japanese parents. The Adjective Check List (Gough) was used to measure self-esteem. Males showed a striking similarity to females in their profiles, which were characterized by high self-esteem and high aggressiveness. —M. Akhtar

812. Rappaport, Ernest A. **The development of an obsessional paranoid delusion.** *International Review of Psycho-Analysis*, 1974, Vol 1(4), 517-527. Discusses the rationalizations encapsulating A. Hitler's paranoid delu-

sion about the Jews. The life-long tendency to merge with the object of his desire for admiration is seen as the core of his delusional system. Hitler's fusion with his mother is described as a splitting into 2 antagonistic stereotypes: a savior-creator and a disease carrier. The disease carrier delusion was projected onto the Jews. Hitler's fantasies of ambush and surprise attack are related to his later use of blitzkrieg tactics. (17 ref)—R. Tomasko.

813. Roberts, Denton L. **Treatment of cultural scripts.** *Transactional Analysis Journal*, 1975(Jan), Vol 5(1), 29-35.—Combines gestalt figure-ground concepts with script theory. The ongoing external stress of a person's societal situation distorts what is figure and what is ground. This causes oppression and encourages individuals to structure situations that reinforce the distortion. Cultural, ethnic, family, and social class scripts interlock with personal life scripts; all must be dealt with to achieve personal autonomy. Treatment of cultural scripts calls for decisions affecting Parent, Adult, and Child. 5 case examples are presented.—R. Tomasko.

814. Saunders, John T. **The paradox of self-deception.** *Philosophy & Phenomenological Research*, 1975(Jun), Vol 35(4), 559-570.—Argues that self-deception only appears to be a self-contradiction. The apparent contradictions are removed by distinguishing between a strong sense and a weak sense of various forms of consciousness (e.g., "knowing" and "believing"). Reference is made to H. Fingarette's *Self-Deception*.

815. Sivasankar, Manoranjna S. (Columbia U) **National consciousness and children of international civil servants studying at the United Nations International School in New York City.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 625-626.

816. Smith, Bernadette M. & Nelson, L.D. (Virginia Commonwealth U) **Personality correlates of helping behavior.** *Psychological Reports*, 1975(Aug), Vol 37(1), 307-310.—571 male members of volunteers groups (Big Brother organizations) and 699 nonvolunteers scored significantly differently on the 16 PF, volunteers being more extroverted (out-going, happy-go-lucky, venturesome, and tenderminded) and scoring lower on shrewd, liberal, and self-sufficient.—*Journal abstract.*

817. Starr, Paul D. (American U, Beirut, Lebanon) **Machiavellianism among traditional and westernized Arab students.** *Journal of Social Psychology*, 1975(Aug), Vol 96(2), 179-185.—Compared responses of American and Arab undergraduates to English and Arabic versions of the Mach IV Scale. There was no significant difference between Arab ($n = 150$) and American ($n = 724$) male respondents. Although the Arabs scored significantly higher than the Americans when sex differences were not considered, the overall difference was essentially due to the higher scores of the Arab females ($n = 92$) in comparison with the American females ($n = 832$). Contrary to the findings of previous studies conducted in other cultural settings, no significant differences were observed between Arab males and females, between traditional and more Westernized respondents or among those from large cities, small cities, or villages.—*Journal abstract.*

818. Steingart, Irving; Freedman, Norbert; Grand, Stanley & Buchwald, Charles. (State U New York, Downstate Medical Ctr. Brooklyn) **Personality organization and language behavior: The imprint of psychological differentiation on language behavior in varying communication conditions.** *Journal of Psycholinguistic Research*, 1975(Jul), Vol 4(3), 241-255.—The language behavior of 11 field-independent (F-I) and 8 field-dependent (F-D) (on the basis of rod- and frame test scores) clinically normal, verbally resourceful female college students was examined in 3 different communication conditions: dialogue, warm (visually supportive) monologue, and cold (visually nonsupportive and stressful) monologue. Ss were administered the Vocabulary subtest of the WAIS and 3 tests of verbal fluency. F-I and F-D Ss produced similar amounts of the different types of language behavior evaluated in each of the 3 communicative conditions. However, they differed with respect to verbal output and length of sentence "packaging" unit in monologue conditions. F-D Ss talked considerably less but at the same time produced different types of grammatically more elaborate language behavior in warm and cold monologue compared to their dialogue language behavior. F-I Ss talked considerably more but also showed a type of language autonomy. The pattern of language behavior which characterized F-I speech in dialogue remained the same in both monologue conditions. (21 ref)—*Journal abstract*.

819. Takahashi, Keiko. (Kunitachi Music Coll, Tokyo, Japan) **Development of dependency in female adolescents and young adults.** *Japanese Psychological Research*, 1974(Dec), Vol 16(4), 179-185.—Examined developmental changes in objects and modes of dependent behavior for 168 college, 349 high school, and 249 junior high school female students. A questionnaire containing 24 statements, each describing a desire for concrete dependent behavior, and a 16-item dependency sentence completion test were administered. Findings indicate that adolescents and young adults had a strong dependency motive and that this remained constant. Changes of dependency objects with an increase in age were clearly observed. Both adolescents and young adults continued to have strong emotional ties with their mother. The closest friend of the same sex, less important for junior high school Ss, became the most important object for high school Ss, but among college Ss it was not as important. The importance of love object increased as Ss grew older.—*Journal abstract*.

820. Turner, Ralph H. (U California, Los Angeles) **Is there a quest for identity?** *Sociological Quarterly*, 1975(Spring), Vol 16(2), 148-161. Examined the common assumptions that people today experience an imperative quest for identity and that altruism and work have been displaced as credible routes to self-discovery by the abandonment of inhibition and the attainment of intimacy. A preliminary examination of these premises was made through questions included in a survey of 1,008 adults in the Los Angeles metropolitan area and in questionnaires administered to students at an American university, 2 Australian universities, and 1 British university. Very few adults in Los Angeles, even in the youngest and most highly educated brackets, acknowledged any preoccupation with the question, "Who am I

really?," though most university students in the 4 samples did. Both adults and students endorsed altruism most frequently, impulse-release less frequently, and intimacy with intermediate frequency as routes to self-discovery. They differed most in their evaluation of work as a medium for self-discovery. All observations apply only to a self-conscious search for identity.—*Journal abstract*.

821. Velicer, Wayne F. & Weiner, Barbara J. (U Rhode Island) **Effects of sophistication and faking sets on the Eysenck Personality Inventory.** *Psychological Reports*, 1975(Aug), Vol 37(1), 71-73.—Administered the Eysenck Personality Inventory (EPI) to 205 undergraduates under 4 different sets of faking instructions (no faking instructions, fake salesman, fake librarian, and fake ideal self) and 3 levels of sophistication (control, minimum, and reasonable sophistication levels). Ss in the minimum sophistication group were told only that the test would yield 3 scales which were then named. Ss in the reasonable sophistication condition were also presented with 1 item from each scale as an example. Results indicate that even with minimum sophistication the validity scales of the EPI do not detect faking. It is concluded that structured personality tests offer an efficient and objective means of obtaining information about a person, but only if that person is willing to provide such information honestly and accurately.—*L. Gorsey*.

822. Williams, Mary. **Transience and eternity.** *Psychological Perspectives*, 1974(Fal), Vol 5(2), 158-163.—Discusses the spontaneous experiences which occur in states of nonattention or contemplation. They are considered more common than is admitted, though extremely difficult to express meaningfully in words. Jung's formulation of the transcendent function is expanded to include a concept of aesthetic appreciation.—*R. Tomasko*.

823. Yu, Miriam. (U Michigan) **An exploratory study of women in traditionally male professions and traditionally female professions and the role of creativity in their career choices.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 181.

824. Zeller, Max. **Dismemberment, death and individuation.** *Psychological Perspectives*, 1974(Fal), Vol 5(2), 132-143.—Discusses dream symbols that express a differentiation between the individual and the collective. Examples are given of symbolic representations of wholeness and the individuation process.

PHYSICAL AND PSYCHOLOGICAL DISORDERS

825. Coet, Larry J. & Thornton, Larry W. (U Wyoming) **Age and sex: Factors in defining the term "handicap."** *Psychological Reports*, 1975(Aug), Vol 37(1), 103-106. 67 males and 74 females in 3 age groups (12-25, 26-45, and 46-82 yrs) completed a questionnaire asking them to rank 8 groups or classes of people they felt should be labeled "handicapped." An analysis of variance indicated that, over-all, definitions of the term "handicap" differed significantly according to age and sex. Males emphasized "social" and "intellectual"

conditions, while females stressed the more visible (unattractive) conditions. The youngest age group listed "race," "speech," "socioeconomic" conditions more frequently, while the middle-aged group was more concerned with "physical incapacitation," "blindness," and "heart disease." The oldest group stressed "mental illness" and "mental retardation" most frequently.—*Journal abstract.*

826. Korten, J. J. et al. (Observation Ctr for Mental Defectives, "De Hondsborg," Oisterwijk, Netherlands) **Self-mutilation in a case of 49,XXXXY chromosomal constitution.** *Journal of Mental Deficiency Research*, 1975(Mar), Vol 19(1), 63-71.—Describes the clinical and cytogenetic findings in a 14-yr-old mentally retarded male patient with a 49,XXXXY chromosome pattern. In addition to demonstrating a number of symptoms typical for this syndrome he showed marked self-mutilative behavior under conditions of stress or frustration. (20 ref)—*Journal summary.*

827. Messina, Pietro. (U Roma, Istituto di Psichiatria, Italy) **[The ambiguity of senile behavior.]** (Ital) *Rivista di Psichiatria*, 1974(Nov-Dec), Vol 9(6), 482-493.—After considering the psychological and physiological aspects of normal senility, the condition of pseudoadjustment is defined as involving 2 fundamental mechanisms: a denial of "juvenile status" and also an identification with it. The concept of "pseudoadjustment" involves all the degrees of senile pathology as well as the positive aspect of "the potential revelation of senile wisdom." The problem of communication between King Lear and his daughter Cordelia in the play, *King Lear*, is cited as an example of this ambiguity.—*Journal summary.*

828. Parker, James L. (James Cook U of North Queensland, Townsville, Australia) **The meaning of social incompetence: Tests of a paradigm.** *Australian Journal of Mental Retardation*, 1975(Jun), Vol 3(6), 166-174.—Proposes a paradigm for social incompetence which suggests that social incompetence denotes specific behaviors of an actor which are judged by an arbiter to possess a degree of social unacceptability. However, whether a particular behavior is labeled incompetent by an arbiter is a function of the interaction of the behaviors unacceptability and its perceived rate of occurrence. At one extreme of a continuum are behaviors having low unacceptability but which need high rates of occurrence to be labeled socially incompetent. At the other extreme are behaviors that have high unacceptability but which require only low rates of occurrence to be labeled incompetent. Arbiter groups of counselors, parents, and adolescents rated 40 selected behaviors to test the paradigm in respect to adolescent behavioral repertoires. Effects of intentionality and the normative character of certain behaviors are discussed.—*Journal abstract.*

829. Southern Regional Education Board. **Conference on Mental Health Statistics. Definition of terms in mental health, alcohol abuse, drug abuse, and mental retardation.** Washington, DC: US Government Printing Office, DHEW Pub No. (ADM) 74-38, 1973. 123 p. \$1.50. Outlines a methodology for defining and classifying terms intended for the use of program developers and administrators, educators, statisticians, and budget officials and cost accountants. A 290-item glossary is included.

Mental Disorders

830. Bastiaans, Han. (Reichsuniversität Leiden, Netherlands) **[New psychodynamic and psychobiological aspects of hysteria.]** (Germ) *Praxis der Psychotherapie*, 1974(Aug), Vol 19(4), 159-166.

831. Beckman, Alan C. (Case Western Reserve U) **Role-loss, powerlessness, and depression among older men and women.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 419.

832. Borgna, Eugenio. **[The metamorphosis of spaciality among schizophrenics.]** (Ital) *Rivista di Psichiatria*, 1974(Nov-Dec), Vol 9(6), 494-520.—Maintains that the bizarre interpretations of spaciality will have some meaning if schizophrenia is observed as a phenomenological existential (*Erlebniswelt*) experience, as was done by Heidegger, and as "constitutive aspects of life space," as was done by Minkowski. The case of a 21-yr-old schizophrenic female is presented to reaffirm the dialectic unity of these 2 themes. The phenomenological nature of suicide, distortion of time and space, and the experience of "radical extraneity" are discussed. Delusions and hallucinations come to have heuristic and anthropological significance. (71 ref)—*N. De Palma.*

833. Carr, John E. & Townes, Brenda D. (U Washington, Seattle) **Interpersonal discrimination as a function of age and psychopathology.** *Child Psychiatry & Human Development*, 1975 (Sum), Vol 5(4), 209-215.—Self-distinctiveness scores from the Interpersonal Discrimination Task were obtained on 87 normal and 92 psychiatric patients ranging in age from 16 to 44 yrs. As predicted, self-distinctiveness scores in normals increased from the 2nd to the 3rd decade, then were significantly lower than normals' during the 3rd decade and higher than normals' thereafter. Results are interpreted in terms of patients' tendencies to view themselves as discrepant with age-specific societal expectancies. (17)—*Journal abstract.*

834. Collins, Patrick J. et al. (New York U, Medical School, Neuropsychopharmacology Research Unit) **The Object-Sorting Test as a differential diagnostic tool.** *Comprehensive Psychiatry*, 1975(Jul-Aug), Vol 16(4), 391-397.—Administered the Goldstein-Scheerer Object Sorting Test to a total of 105 inpatients, outpatients, and normal hospital staff in a neuropsychopharmacology research unit to measure the degree of thought disorder present among the patients. It was hypothesized that formal thought disorder would be present in the schizophrenic Ss but not in affective Ss nor in the other psychiatric patients and normals. 8 groups were compared: schizophrenia, nonparanoid type; schizophrenia, paranoid type; schizophrenia, schizo-affective type; manic-depressive, manic phase; manic-depressive, interphase; manic-depressive, depressed phase; other psychiatric disorders; and normal controls. Only the impairment score differentiated among the original groups. When the schizophrenic groups were combined and compared with each of the other groups, the schizophrenics were significantly higher than the normals on the impairment scores and higher than the manic-depressive interphase group on both scores. It is suggested that the Object Sorting Test is not a useful measure as a differential diagnostic tool but may have

some value as an indicator of a general impairment in psychological functioning (19 ref).—*M. E. Pounsel*

835. Doust, J. W., Huszka, Louis & Doust, Jonathan N. (U Toronto Canada) **Psychotropic drugs and gender as modifiers of the role of plasma tryptophan and serotonin in schizophrenia.** (*Comprehensive Psychiatry*, 1975(Jul-Aug), Vol 16(4), 349-355.—Conducted a study with 56 male and 36 female 23-69 yr old ambulatory schizophrenics controlled for psychotropic drug intake and with 29 male and 37 female 19-58 yr old drug-free healthy controls whose plasma tryptophan and plasma serotonin levels reflected the metabolic turnover lacking in previous studies. Sex and age as possible confounding variables were assessed by Student's *t* test and by a series of product-moment correlation coefficients. Results show that untreated schizophrenics of both sexes had a significantly lower level of plasma tryptophan than did controls. The level of plasma serotonin in female schizophrenics was significantly lower than that in the male schizophrenics and also that in healthy female controls. When the influence of sex differences was maximized at the expense of diagnosis and other possible variables, plasma serotonin levels in 33 females were significantly lower than those in 42 males. Age was an important factor. (38 ref)—*M. E. Pounsel*.

836. Egging, Linda; Barker, Philip & Walker, R. J. (Charles Burns Clinic, Birmingham, England) **A study of the heights and weights of different groups of disturbed children.** (*Child Psychiatry & Human Development*, 1975 (Sum), Vol 5(4), 203-208.—Compares mean centile heights and weights with the psychiatric diagnoses of 219 males and females (all 11 yrs or under) referred to a child psychiatric clinic. Neurotic males were found to have significantly greater mean centile heights than males with (a) conduct disorders and (b) specific developmental disorders. No significant difference was found in the females. The difference in males' heights was not associated with any significant difference in social class, family size, or position in the family. No significant weight differences were found. It is concluded that the relationship between physical growth and psychiatric disorder in children merits further investigation.—*Journal abstract*.

837. Eigen, Michael. **On pre-Oedipal castration anxiety.** (*International Review of Psycho-Analysis*, 1974, Vol 1(4), 489-498.—Presents clinical examples of maternal castration anxiety in situations where either parent has been the core pathological agent. Examples include a child analysis, a case of sexual impotence, and an adult narcissistic character problem. The dynamics associated with hostile omnipotence and the projective fear of retaliation are highlighted with case material which considers castration fantasies involving the mother's external penis. The perception of the penis as belonging to men is a developmental achievement, with the child often experiencing himself as the destructive cause of sexual differentiation.—*R. Tomasko*.

838. Finch, A. J. et al. (Virginia Treatment Ctr for Children, Richmond) **Reflection-impulsivity, persistence behavior, and locus of control in emotionally disturbed children.** (*Journal of Consulting & Clinical Psychology*, 1975(Oct), Vol 43(5), 748.—Reports results of a study which suggest that although persistence

behavior is related to the reflection-impulsivity dimension, in that Matching Familiar Figures Test (MFFT) latency was related to duration of persistence, other factors are also involved, since persistence was not significantly related to MFFT errors. In addition, locus of control was related to externals being more impulsive in their cognitive tempo.

839. Fink, P.-Chr. [The clinical phenomena of hysteria from the viewpoint of the general practitioner.] (*Germ) Praxis der Psychotherapie*, 1974(Aug), Vol 19(4), 167-171.

840. Fowler, Richard C. & Tsuang, Ming T. (U Iowa, Medical Coll) **Spouses of schizophrenics: A blind comparative study.** (*Comprehensive Psychiatry*, 1975(Jul-Aug), Vol 16(4), 339-342.—Attempted to determine the frequency and type of mental disorders in spouses of schizophrenics in comparison to the spouses of manics and unipolar depressives. Ss were the spouses of 293 psychiatric patients out of a sample of 525 studied by J. Morrison et al (1972). It was found that 60 of the spouses were mentally disordered and that personality disorders were more common in the spouses of schizophrenics than in the spouses of affective-disordered patients. These personality disorders contrasted with those described by L. L. Heston (see PA, Vol 40:13375) in that they were milder and less sociopathic (most were classified as unspecified personality disorders.). In addition, schizoid-like qualities were not noted. However, the excessive illness seen in the spouses of schizophrenics suggests that it could be a significant factor in the frequent occurrence of personality disorders in the children of schizophrenics.—*M. E. Pounsel*.

841. Graceffo, Charles. **The effects of depression on family structure.** (*Family Therapy*, 1972(Sum), Vol 1(1), 57-62.—Discusses the adolescent depressive personality and his needs. The depressed patient fears intimacy, so he chooses an inadequate marriage partner, one who will complement his feelings of power, or one to whom he may relinquish control. In either case, the partner provides no threat to the depressed patient's low self-esteem, and his feelings of inadequacy are not threatened. Other aspects of the adolescent personality that affect successful treatment are discussed.—*D. P. Judd*.

843. Isaev, D. N. (Pediatric Medical Inst, Leningrad, USSR) **Schizophrenia in relation to other mental disorders of childhood.** (*International Journal of Mental Health*, 1974(Spr), Vol 3(1), 47-56.—Suggests that childhood schizophrenia, a rare disease, must be differentiated from other diseases like leukoencephalitis, Heller's disease, early infantile autism, manic depressive psychoses, etc., on the basis of the symptoms peculiar to each. This can be done by studying the clinical picture as a whole and by determining the distinctive features of the course of the disease. Both psychopathological and biological studies are needed for diagnosis. The clinical picture varies according to cultural, ethnographic, and socioeconomic conditions, frustrating experiences of the patient, his particular interreactions with family and peer

groups, etc. Disregarding these factors may result in faulty diagnosis. (37 ref)—A. H. Alawi.

844. Janzarik, Werner. (U Heidelberg, Psychiatrische Klinik, W Germany) [Problems of structural-dynamic coherence in cyclothymia research.] (Germ) *Nervenarzt*, 1974(Dec), Vol 45(12), 628-638.—Theoretical examination of affective psychoses, endogenous depression, and "typus melancholicus" in relation to a feedback interaction termed structural-dynamic coherence. (54 ref)—J. Rutschmann.

845. Jonsson, Henrik. (U Lund, Sweden) **A factorial study of schizophrenia.** *Scandinavian Journal of Psychology*, 1975, Vol 16(2), 125-130.—Performed a Q-factor analysis of 30 normal and 35 schizophrenic Ss, aged 16-53 yrs, in order to explore the domain of schizophrenia and to test the differential validity of a 177-item test battery. One normality factor and 4 factors of schizophrenia were isolated. A cross-validation using a new sample of normal and schizophrenic Ss was carried out. The normality factor was then used as a basis for predicting group membership for the new Ss. The result was a correct placement of the Ss in the normal or schizophrenic category. It is concluded that the 4 factors of schizophrenia, at least 2 of which were found to be descriptively relevant and related to independent diagnostic criteria, required further verification. (26 ref)—*Journal abstract*.

846. Klawans, Harold L.; Westheimer, Ruth & Goetz, Christopher C. (Michael Reese Hosp, Chicago, IL) **Prospects for a pharmacological treatment of phenyleketonuria.** *Diseases of the Nervous System*, 1975(May), Vol 36(5, Pt 1), 267-275.—Presents a pharmacological model of the pathophysiology of schizophrenia based upon receptor site theory. This model proposes that, like any neuronal function, schizophrenia is triggered by the action of a small molecule at a specific receptor site. This interaction elicits the abnormal behavior. The model permits analysis of all existing theories of the pathogenesis of schizophrenia and furthermore makes it possible to view the pathophysiologic implications of these theories. It also makes it possible to understand the mechanism of action of neuroleptic agents used in the treatment of schizophrenia, regardless of which theories of pathogenesis are valid. (65 ref) *Journal summary*.

847. Laberge, P. (Inst Philippe Pinel de Montréal, Canada) [A case of fire-fetishism.] (Fren) *Information Psychiatrique*, 1974(Dec), Vol 50(10), 1021-1024.—Presents a psychoanalytic interpretation and case history of a Pyromaniac.

848. Loreto, D. (Hosp Psichiatrico Provinciale di Como, Italy) [Spearman's general factor theory in relation to schizophrenic thinking.] (Ital) *Neuropsychiatria*, 1973(Jan-Jun), Vol 29(1-2), 27-41.—Examines the validity of Raven's Progressive Matrices with 14 male and 16 female schizophrenics (average hospitalization 8 yrs). Ss, who were 50-60 yrs old, were administered the tests individually and an inquiry concerning their response choices. The group mean reached only the 25th percentile of the normative group, suggesting considerable intellectual deficit. Item analysis of omissions and correct and incorrect choices revealed that item difficulty increased progressively within each series and in successive series, supporting the inference of Spearman's g or

abstract reasoning. Incorrect choices tended to concentrate in particular alternatives, as determined by their spatial and serial position and their configurational aspects. An analysis of the reasons for particular alternatives, as determined by their spatial and serial position and their configurational aspects. An analysis of the reasons for particular choices revealed primitive thought processes resembling the stages described in L. S. Vigotsky's (1962) and Piaget's theories. While valid for normal adults, the test has limited validity as a measuring instrument for an aging pathological group. (English, French & German summaries) (26 ref) *J. Felice*.

849. Lutz, J. (U Zurich, Switzerland) **Toward a better understanding of infantile autism as a disturbance of ego awareness, ego activity, and ego imprint.** *International Journal of Mental Health*, 1974(Spr), Vol 3(1), 74-89.—Discusses infantile autism from the therapy, of developmental psychology. 8 patients who exhibited signs of infantile autism were characterized not only by disorders in relations with the external world but also by stereotyped movements, delay in ego awareness, speech disorders, and other marks of disintegrated personality. It is observed that the concept of autism as an ego disturbance has proved a valuable starting point for therapy, and improvements have been noted in many cases in the course of a few years.—A. H. Alawi.

850. Maloney, Michael P.; deYoung, Robert & Majovsky, Lawrence. (U Southern California Medical School) **Performance of hospitalized schizophrenics on picture vocabulary (QT) and verbal vocabulary (WAIS) measures.** *Psychological Reports*, 1975(Aug), Vol 37(1), 217-218.—Hypothesized that 29 19-56 yr old schizophrenic inpatients would perform better on a vocabulary task (WAIS) demanding verbally expressed definitions than on a picture vocabulary measure (Quick Test). Results support this hypothesis.—*Journal abstract*.

851. Marcus, Joseph. (Hebrew U, Jerusalem Mental Health Ctr, Israel) **Cerebral functioning in offspring of schizophrenics: A possible genetic factor.** *International Journal of Mental Health*, 1974(Spr), Vol 3(1), 57-73.—Conducted psychological and neurological examinations of Israeli school age children in 2 groups: 50 index cases (Ss with one schizophrenic parent) and 50 control cases (Ss with normal parents). Each group was further divided into Ss reared in the city and Ss reared in kibbutzim. The overall scores of nonoptimal functioning, subjected to statistical analyses, showed signs of delayed CNS maturation, especially fine motor development, perception, and intersensory integration. Some differences indicating an influence of environment and sex were noted, but the trends are not marked. Limitations of the study are pointed out. A related study of infants ("The Jerusalem Infant Development Study") is still in its initial stages, but observations on 6 Ss seem to point in the same direction as findings of the school age study. It is felt that these studies may pave the way for biochemical methods of treating schizophrenics. (36 ref)—A. H. Alawi.

852. Miller, Robert T. (Albert Einstein Coll of Medicine, Yeshiva U) **Childhood schizophrenia: A review of selected literature.** *International Journal of Mental Health*, 1974(Spr), Vol 3(1), 3-46.—Reviews

literature on the classification, causes, mechanisms, and therapy of psychotic states in childhood. Deviant behavior takes different forms in different age groups. Some researchers argue for a discontinuity in childhood psychoses, those occurring after 7 yrs of age being early forms of adult schizophrenia and those occurring before 3 yrs of age being a distant disorder, not related to adult schizophrenia (this view, however, does not account for certain clinical observations). Others regard childhood autism as an early form of schizophrenia. Theories of causation fall into 4 categories: primary organismic atypicality, familial and environmental causation, dichotomy, and interaction. A variety of pathogenic mechanisms (disorders in relationship, in CNS maturation, in sensory integration, etc) have been proposed with varying amounts of supporting evidence. The relationship between IQ and childhood psychoses remains unclear. The results of treatment programs of all varieties have, in general, not been very encouraging. (6% p ref)—A. H. Alawi.

853. **Milstoc, Mayer; Teodoru, Constantin V.; Fielev, Ronald R. & Kumburaci, Terra.** (New York U. Medical Ctr, Goldwater Memorial Hosp) **Cholinesterase activity and the manic depressive patients.** *Diseases of the Nervous System*, 1975(Apr), Vol 36(4), 197-199.—Compared the cholinesterase activity found in the plasma and red blood cells of manic-depressive patients with that of normal individuals. 40 20-70 yr old placebo-treated unipolar and bipolar manic-depressive outpatients were studied. 160 normal adults of corresponding characteristics were used to establish normal control values. Cholinesterase activity was determined with a spectrophotometer. Results indicate that red blood cell cholinesterase activity showed a significant difference between the manic-depressive and the control group ($p < .001$), while plasma activity remained constant. The importance of considering the acetylcholine-cholinesterase system when studying the biochemistry of manic-depressive disease is noted. (17 ref)—R. Tomasko.

854. **Noach, Marlene.** (U. Witwatersrand, Johannesburg, South Africa) **Concept formation in the speaking autistic child.** *International Journal of Mental Health*, 1974(Spring), Vol 3(1), 100-109. Attempted to determine the structure of concept formation on different levels of its development in 4 speaking autistic female Ss 8.9-14.4 yrs old compared with a similar group of 4 normal Ss. The task, a modified form of the test of concept formation by E. Hanfmann and J. Kasanin (1937), consisted of 22 cardboard blocks with 1 of 4 "names" (nonsense syllables) written on the bottom of each block. Ss were required to sort the blocks on the basis of these names. Results show that concept formation by the autistic Ss was definitely impaired. It is suggested that therapy for such children should begin at an early stage of development with the improvement of their perceptual abilities, and proceeding through abstraction and generalization to concept formation.—A. H. Alawi.

855. **Serban, George.** (New York U, Bellevue Medical Ctr) **The phenomenology of depression.** *American Journal of Psychotherapy*, 1975(Jul), Vol 29(3), 355-362.—Discusses the basic mechanism underlying depression. It is hypothesized that depression results from a faulty system of thinking which develops during the patient's

formative years. The depressed person tends to evaluate reality either on the basis of absolute, rigid social and moral codes, or in terms of distorted notions of his own limitations and expectations. His inadequate assessment of reality leads to difficulty in adapting to stress. The case history of a 43-yr-old businessman suffering from chronic depression following the death of his parents is used to illustrate this mechanism. (15 ref)—*Journal summary.*

856. **Spalt, Lee.** (Southern Illinois U, Health Service, Carbondale) **Demographic characteristics in affective disorders.** *Diseases of the Nervous System*, 1975(Apr), Vol 36(4), 209-214.—Studied the variance of type of affective disorder with demographic characteristics. Diagnostic interviews were given to 154 psychiatric outpatients. Affective disorders were present in 75% of the patients and were associated with older age, divorce, and shorter duration of marital status. Race, sex, education, and income level were not related to the presence of affective disorders. Secondary affective disorders were associated with lower income levels than were primary disorders. Lower education and income were demonstrated for patients with bipolar primary affective disorders. (30 ref)—R. Tomasko.

857. **Vacek, J. & Svejkská, J.** (Psychiatrické oddělení OÚNZ, Karlovy Vary, Czechoslovakia) **[Another case of hospital vagrancy (Münchhausen syndrome).]** (Czech) *Ceskoslovenská Psychiatrie*, 1974(Jun), Vol 70(3), 186-191.—Discusses the "Münchhausen syndrome" which is characterized by a combination of chronic malingering, hypochondria, self-mutilations, masochism, vagrancy, pseudologia fantastica, and other psychopathic features. The case history of 1 patient with such polymorphic symptomatology is presented and the difficulty of making a positive differential diagnosis is pointed out. Fewer doubts were expressed, however, about the need to prescribe long-term in- and outpatient supervision. (Russian & English summaries)—V. Fischman.

858. **Van Dyke, John L.; Rosenthal, David & Rasmussen, P. Vestberg.** (NIMH, Bethesda, MD) **Schizophrenia: Effects of inheritance and rearing on reaction time.** *Canadian Journal of Behavioural Science*, 1975(Jul), Vol 7(3), 223-236.—Studied both manual and verbal reaction time in 4 selected groups of adult Ss ($N = 258$) in an attempt to uncover hereditary and environmental influences on the reaction time of Ss whose parents do or do not have schizophrenic disorders. The groups included (a) adoptive offspring of schizophrenic parents (adoptive index); (b) adoptive offspring of nonschizophrenic parents, but whose adoptive parents had a psychiatric record of schizophrenic disorder (cross-foster); (c) adoptive offspring of nonschizophrenic parents (adoptive control); and (d) offspring of schizophrenic parents who were reared by their biological parents (nonadoptees). Analysis of variance was used to assess the effects of rearing by a schizophrenic parent, a genetic background for schizophrenia, and interaction between rearing and genetic background. Groups opposed for genetic background for schizophrenia were not different in reaction time performance, while groups opposed for rearing by a schizophrenic parent were significantly so. Mean reaction time was slower in groups

reared by a schizophrenic parent than in those reared by a nonschizophrenic parent. There was no significant interaction between rearing and genetic background on reaction time performance. (French summary) [18 ref.]—*Journal abstract*

859. Waldron, Sherwood; Shrier, Diane K.; Stone, Betty & Tobin, Frances. (Albert Einstein Coll. of Medicine, Yeshiva U.) School phobia and other childhood neuroses: A systematic study of the children and their families. *American Journal of Psychiatry*, 1975, Aug, 802-808.—Developed reliable clinical rating scales to compare 35 5-9 yr old children with school phobia and their families with a matched sample of children with other neuroses and their families. Twice as many school phobic children with other neuroses showed excessive separation anxiety, dependency, and depression. Although a mutually hostile-dependent interaction was found in most of the families of children with school phobia, the development of school phobia appeared to be dependent on defects in character development in the children as well. The etiological significance of the almost universal parental pathology and family malfunction for both groups of children is discussed. (34 ref.)—*Journal abstract*.

(U Washington, Medical School, Div of Adolescent Medicine, Seattle) Runaways: A growing social and family problem. *Journal of Family Practice*, 1975(Aug), Vol 2(4), 255-258.—Discusses the scope of the runaway problem, its social and historical background, classification of runaways, institutional responses to the problem, and the role of family physician in providing remedial and preventive help to runaways and their families. Suggestions for individual and family counseling and assessment of the adolescent-parent relationship are presented.

864. Grant, Igor & Mohs, Lynn. (U California, San Diego) Chronic cerebral effects of alcohol and drug abuse. *International Journal of the Addictions*, 1975(Oct),

Vol 10(10), 1001-1010.—A review of the literature on the chronic effects of alcohol and drug abuse on the brain. The review is divided into two main sections: alcohol and drugs. Evidence also suggests that cerebral dysfunction, impaired abstracting ability, occurs in persons who do not develop the Wernicke-Korsakoff syndrome. There is no consistent evidence of long-term manhua, hallucinogens, or sedative use causing lasting neurological impairment. The deficits in abstract thinking reported by some LSD studies are similar to deficits in some reported among alcoholics; however, since the LSD studies were not controlled for alcohol use, their interpretation is difficult. It appears that cerebral dysfunction occurs more frequently and at a younger age among amphetamine abusers (3 p ref).—*Journal abstract*.

865. Kilgus, Valerie & Varri, Habib. (Lafayette Clinic, Detroit, MI) EEG abnormalities in alcohol and drug users. *Adolescence*, 1975(Spr), Vol 10(37), 1-10.

Investigated the possible effects of drug abuse on the CNS by comparing the incidence of EEG abnormalities in 54 adolescent drug users and 54 matched nonusers. All Ss were new admissions to an adolescent inpatient service. Recording was made on a 16-channel polygraph. 40 abusers and 35 nonabusers had abnormal results. Findings could not be related to particular drugs.—*A. Krichew*.

866. Kovacs, Maria; Beck, Aaron T. & Wellesman, Arlene. (U Pennsylvania, Medical School) The use of suicidal motives in the psychotherapy of attempted suicides. *American Journal of Psychotherapy*, 1975(Jul), Vol 29(3), 363-368.—Examined reasons reported for suicide attempts in relation to hopelessness and depression. The Purpose of Attempt item from the Suicidal Intent Scale, the Beck Depression Inventory, and the Hopelessness Scale were administered to 79 male and 121 female patients who had been hospitalized following an attempted suicide. Their reasons suggest that (a) the majority of persons who try to kill themselves give reasons indicating that their problems are insoluble, and they wish to escape from a life which is not worth living; (b) persons who intend to manipulate others through suicide attempts are significantly less depressed and hopeless than those who wish to escape life. These results are discussed in terms of their implications for psychotherapy with suicidal patients.—*J. Adams-Webber*.

867. Kratoski, Peter C. & Kratoski, John E. (Kent State U) Changing patterns in the delinquent activities of boys and girls: A self-reported delinquency analysis. *Adolescence*, 1975(Spr), Vol 10(37), 83-91.—104 male and 144 female high school students enumerated delinquent acts they had performed. Many traditional assumptions were upheld. Males, for example, had engaged in more aggressive delinquencies while there were few differences in those acts reflecting a teenage cultural orientation; males committed twice as many delinquencies as females. Class differences were nil. (21 ref)—*A. Krichew*.

868. Lewis, Dorothy O. & Balla, David. (Yale U, Child Study Ctr) "Sociopathy" and its synonyms: Inappropriate diagnoses in child psychiatry. *American Journal of Psychiatry*, 1975(Jul), Vol 132(7), 720-722.—Posits that the use of the diagnosis "socially" and its synonyms

hinders the search for other kinds of symptomatology, the recognition of which might lead to appropriate therapeutic intervention. The authors' experience with the use of the terms "sociopathic character" and a search of the literature served as the basis for the argument. It is suggested that the terms "sociopathic personality," "antisocial personality," and "acting out aggressive reaction of childhood or adolescence" be eliminated as primary diagnoses from the psychiatric nomenclature for children or adolescents. 2 case reports are presented to emphasize the damage these diagnoses can cause. (15 ref)—*Journal abstract*

869. McNuliffe, William E. (Johns Hopkins U) **A test of Lindesmith's theory of opiate addiction.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 436.

870. McKisack, Ian J. (U Waikato, Hamilton, New Zealand) **Early socialisation: The baseline in delinquency research.** *International Journal of Criminology & Penology*, 1975(Feb), Vol 3(1), 43-51.—Postulates that early socialization in the family may be used as a baseline for measuring later development of delinquency. It is assumed that the essential roots of many delinquent acts lie in inadequate socialization, with subsequent lack of concern for self and others. Sociometric acceptance by peers might be used as a measure of adequate socialization (i.e., ability to maintain harmonious relationships). Inadequate socialization can be seen as various combinations of deficiencies in 2 basic components—attachment and guidance. The complexity and difficulty in examining the interaction between early socialization and societal frustration, pressures, and opportunities in psychological assessment is discussed.—S. S. Liu.

871. Mečtř, J. (U Karlova, Prague, Czechoslovakia) **[Mentally disturbed juvenile arsonists.]** (Czec) *Ceskoslovenská Psychiatrie*, 1974(Jun), Vol 70(3), 158-166.—Reviews literature on pyromaniacs and presents case histories of 7 patients who had different family, psychological, and medical backgrounds and represented different diagnostic types. In each case arson was a serious symptom of a more complex psychopathology or behavior disorder. (Russian & English summaries)—V. Fischman.

872. Miller, John P. (Ontario Inst for Studies in Education, Northwestern Ctr, Thunder Bay, Canada) **Suicide and adolescence.** *Adolescence*, 1975(Spring), Vol 10(37), 11-24.—Reviews investigations concerning the nature of suicide in adolescence. The loss of a love object, identification with a deceased loved one, and stress are often factors behind the suicides. Depression is the most frequent emotion, but it may be masked by boredom or restlessness. Acting-out behaviors are common. Adolescent suicides tend to have been suggestible and hypersensitive and to have felt inadequate. Self-alienation must be treated. (19 ref)—A. Krichew.

873. Morrison, James R. & Minkoff, Kenneth. (U California, San Diego) **Explosive personality as a sequel to the hyperactive-child syndrome.** *Comprehensive Psychiatry*, 1975(Jul-Aug), Vol 16(4), 343-348.—Presents 3 case reports in which common background factors suggesting a possible etiology of the explosive personality are described. Results of the administration of tricyclic antidepressants in each case are discussed. (20 ref)

874. Ogborne, Alan C. (Inst of Psychiatry, Addiction Research Unit, London, England) **Two types of heroin reactions.** *British Journal of Addiction*, 1974(Sep), Vol 69(3), 237-241.—A principle component analysis of responses of a sample of 111 heroin addicts to statements relating to the effects of heroin gave 2 interpretable components. These were labeled Enhancement and Avoidance. 2 groups of Ss, defined as Enhancers and Avoiders in terms of their scores on these components, were compared with respect to a number of variables. The Enhancers were more likely to have used heroin for a period in excess of 4 yrs. They had a more positive evaluation of heroin and of themselves. They claimed more control of heroin and saw its use as being compatible with living a normal life. It is suggested that the kind of experiences Ss claim heroin to produce belong to the extent of their orientation to heroin and its use.—*Journal summary*.

875. Revitch, Eugene. (New Jersey State Diagnostic Ctr, Menlo Park) **Psychiatric evaluation and classification of antisocial activities.** *Diseases of the Nervous System*, 1975(Aug), Vol 36(8), 419-421.—Posits that the description and understanding of the motivational dynamics of the antisocial act within the context of personality organization, values, and empathic capacity are essential in examination of offenders. A spectrum of motivational factors is presented as part of the diagnostic and prognostic evaluation. It is stated that it is obvious that the socially and situationally stimulated offenders, except for the few who may be psychotic, should be treated correctionally, while the impulsive, compulsive, and catathymic offenders cannot be deterred through correctional measures.—*Journal summary*.

876. Ryback, Ralph S. (McLean Hosp, Alcohol & Drug Abuse Services, Boston, MA) **Psychological aspects of alcohol and alcoholism.** *Massachusetts Journal of Mental Health*, 1974(Fal), Vol 5(1), 19-44.—Reviews literature on psychological aspects of alcoholism. Cultural, genetic, biochemical, and environmental explanations, as well as the attempt to find the alcoholic personality, are deemed inadequate. It is noted that alcohol may act in various ways to maintain psychological balance. Suggested functions are (a) a defense against loneliness; (b) a socially acceptable way of expressing anger; (c) an obsessional defense against depression; (d) unconscious paranoid organization; (e) a cry for help; (f) maintenance of a life-style or role; and (g) a method of dealing with psychic pain. Alcoholics may be described using different diagnostic categories: (a) neuroses; (b) personality disorders; and (c) schizophrenia. Treatment first involves detoxification, then the creation of external controls (support systems of various kinds), and finally the development of internal, or self control. (62 ref)—P. R. Sweet.

877. Singer, K. (U Hong Kong, Queen Mary Hosp) **The choice of intoxicant among the Chinese.** *British Journal of Addiction*, 1974(Sep), Vol 69(3), 257-268.—Surveys the alcohol and narcotics choices and the prevalence pattern of dependence on these substances among the Chinese, showing that these differ significantly from those in the West. Possible factors responsible for the distinctive pattern in the Chinese are considered. Probably significant are cultural ideology sanctioning

acquiescence, moderation, propriety, conformity, and intellectual control; historical events leading to the availability of opiates over a long period; and a high level of social pathology associated with culture change, economic hardship, and easy accessibility to drugs. (40 ref.) *Journal abstract*

878. Tarter, Ralph E. (Carner Clinic Foundation, Belle Mead, NJ) **Personality characteristics of male alcoholics.** *Psychological Reports*, 1975(Aug), Vol 37(1), 91-96.—48 alcoholics (mean age, 44.4 yrs) who were administered the California Psychological Inventory were distinguished from 24 normals (mean age, 43.3 yrs) on the Socialization and Self-control scales. Early- and late-onset drinkers (before or after age 30) were also differentiated on several measures (e.g., Flexibility, Social Pressure, and Achievement Via Independence scales), suggesting that late-onset drinkers are acutely disturbed while the early-onset drinkers are less consistent and exhibit disorders relating to personality organization. (16 ref.) *Journal abstract*

879. Tarter, Ralph E. (Carrier Clinic Foundation, Belle Meade, NY) **Brain damage associated with chronic alcoholism.** *Diseases of the Nervous System*, 1975(Apr), Vol 36(4), 185-187.—Discusses 3 hypotheses concerning the nature of neurological and psychological disorder in chronic alcoholics. The available literature is summarized to test the hypotheses and to provide a systematic conceptualization of the neuropsychological status of chronic alcoholics. The evidence from the literature does not support the hypothesis that alcoholics suffer from a diffuse generalized cerebral impairment nor that they are differentially more impaired in the right than left brain hemispheres. The notion that chronic alcoholics suffer from an anterior-basal focus of impairment is supported. (43 ref.)—*R. Tomasko.*

880. Thornton, William E. & Pray, Bonnie J. (U Chicago, Drug Research Clinics) **The portrait of a murderer.** *Diseases of the Nervous System*, 1975(Apr), Vol 36(4), 176-178.—Presents a case study of an impulsive, violent, and paranoid young murderer, to illustrate the use of indicators in the prediction of murderous behavior. (18 ref)

881. Toolan, James M. (U Vermont, Medical School) **Suicide in children and adolescents.** *American Journal of Psychotherapy*, 1975(Jul), Vol 29(3), 339-344.—Reviews theory, research, and clinical data relating to suicide in children and adolescents. In general, suicide rates are underestimated more for these groups than for adults. However, suicide among adolescents has shown the greatest rise for any age group. The symptoms of depressed, suicidal children and adolescents are described in detail. It is recommended that everyone under the age of 18 who attempts or threatens suicide should have a thorough psychiatric examination. Many of them could benefit from intensive individual or group psychotherapy. (16 ref.) *Journal summary.*

882. Vacc, Nicholas A. & Rajpal, Puran L. (State University Coll, Fredonia) **Comparison of social positions of school children in India and the United States.** *Psychological Reports*, 1975(Aug), Vol 37(1), 208-210.

Compared the social positions of 2 groups of 11-17 yr old children in India and the US: those identified as having behavioral disorders (21 American, 22 Indian)

and those classified as normal (415 American, 117 Indian). Analysis of the data revealed that the social positions of children in the 2 cultures are similar. Results suggest that cross-cultural differences may be related to the 2 cultures' attitudes toward children with behavioral disorders. *Journal abstract*

883. Walker, James R. (U Utah) **An attitudinal and biographical comparison of delinquent and non delinquent children in Salt Lake County.** *Journal of the American Academy of Child and Adolescent Psychiatry*, 1975, Vol 14(4), 481-491.

884. Wiseman, Jacqueline P. (U California, San Diego) **An alternative role for the wife of an alcoholic in Finland.** *Journal of Marriage & the Family*, 1975(Feb), Vol 37(1), 172-179.—Reports results of a study which show that of 75 wives of alcoholics in Helsinki, 40% escaped into an existence in which they increased work and hobby skills, gained job promotions, and scheduled their time to avoid contact with husbands. It is suggested that husbands attempting sobriety after this development may find wives torn between marital duty and their separate existence. (18 ref)

885. Woody, George E.; O'Brien, Charles P. & Greenstein, Robert A. (Hosp, Pennsylvania State, Dependence Treatment Ctr, PA) **Misuse and abuse of diazepam: An increasingly common medical problem.** *International Journal of the Addictions*, 1975(Oct), Vol 10(5), 843-848.—Reports findings on the misuse and abuse of diazepam among addiction-prone individuals found in a Philadelphia Veterans Administration drug treatment center. The most common pattern of abuse appears to be periodic ingestion of 30-80 mg of diazepam in 1 dose, either alone or in conjunction with methadone or other narcotics. 2 cases of physical dependency to diazepam are described. Many addict patients using diazepam buy it on the streets. *Journal summary.*

886. Zielen, V. [Anthropological aspects of the drug problem.] (Germ) *Analytische Psychologie*, 1975, Vol 6(1), 45-56.—Asserts that confrontation with the culture norms stimulates and differentiates vital power which will strengthen group norm and consciousness. In today's society, this development turns into its opposite. The fixed standards and aims of life are almost rationalized and technicalized in German culture and may lead to a consumption of the culture's standards. This could probably be followed by an atomizing, thus producing a disturbance of the group norm. An addicted individual who is confronted with an unacceptable pattern of life might withdraw to a stage of functional habits only, or he may go back to primitive psychological experiences. A psychotherapist should not only seek to help the individual addict to find a useful way of handling his existence problem, but he should also try to provide spiritual explanations for the addict's behavior. —*S. D. Babcock.*

Learning Disorders & Mental Retardation

887. Baran, Stanley J. & Meyer, Timothy P. (Cleveland State U) **Retarded children's perceptions of favorite television characters as behavioral models.** *Mental Retardation*, 1975(Aug), Vol 13(4), 28-31.—Gave various hypothetical situations to 45 male and 25 female trainable mentally retarded 5-20 yr olds and asked them

what they would do in those situations, what was the right thing to do, what their parents would want them to do, what their best friends would do, and what their favorite TV characters would do. The strongest relationships existed between how Ss reported they would behave, how their best friends would behave, and how their favorite TV characters would behave. Few sex differences were found, although differences between females in this study and females in studies testing nonretardates are discussed.—*Journal abstract.*

893. Mackay, D. N. & Elliott, Ruth. (Muckamore Abbey Hosp, Northern Ireland) **Subnormals under community and hospital care.** *Journal of Mental Defi-*

ciency Research, 1975(Mar), Vol 19(1), 21-27.—Conducted a survey of the populations of subnormals ($N = 6,117$) under hospital care and under community care in Northern Ireland. Results show that (a) the hospitalized population was not representative of the population of subnormals under community care, high grade (IQ $50 \times$) cases being underrepresented and low grade (IQ < 20) cases being overrepresented among the former; (b) the age distributions of the 2 populations varied significantly; and (c) from the age of 10-14 yrs, the bulk of low grade cases at each successive age group were under hospital care; from the age of 40-44, the bulk of medium grade patients were under the same type of care; in the case of high grade individuals the age group at which the preponderance in numbers changed from one type of care to the other was 50-54 yrs.—*Journal summary.*

894. Mosley, J. L. (U Calgary, Canada) **Acquisition and extinction of the human eyelid conditioned response as related to intellectual functioning.** *Journal of Mental Deficiency Research*, 1975(Mar), Vol 19(1), 29-36.—Studied the human eyelid CR in 10 retarded 19-21 yr olds and 10 college students matched for age and sex. In agreement with the earlier studies investigating the acquisition of the eyelid CR, there was no significance difference in the rate of acquisition as a function of intellectual level. Extinction and spontaneous recovery were significantly related to the level of intellectual functioning. Results are interpreted as being due to the absence of the cognitive inhibitory set assumed to be operative with nonreinforcement for the intellectually subaverage Ss relative to the intellectually average Ss. (24 ref)—*Journal summary.*

895. Ryave, Alan L. (U California, Los Angeles) **Aspects of story-telling among a group of "mentally retarded."** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 875.

896. Wallbrown, Fred H.; Blaha, John; Huelsman, Charles B. & Wallbrown, Jane D. (Columbus Public Schools, OH) **A further test of Myklebust's cognitive structure hypothesis for reading disabled children.** *Psychology in the Schools*, 1975(Apr), Vol 12(2), 176-181.—Investigated the validity of 3 cognitive structure hypotheses formulated by Myklebust, Bannochie, and Killen for learning disabilities. Support was obtained for 2 of the 3 hypotheses: the ability structure for the severely reading disabled was distinguishable from that of the normals by less effective ability integration and a different overall ability arrangement, but was not distinguishable with respect to degree of organization.—*H. Kaczkowski.*

897. Walls, R. T.; Majumder, R. K.; Gulkus, S. P. & Stuart, J. D. (West Virginia U, Rehabilitation Research & Training Ctr) **Galvanic skin response arousal as a function of positive versus negative feedback in retarded adults.** *Journal of Mental Deficiency Research*, 1975(Mar), Vol 19(1), 57-61.—30 mentally retarded young adults guessed 1 of 2 routes at each of 11 choice points of a multiple T maze. Following visual and verbal feedback, the S's GSR was monitored in a 5-sec postfeedback period. As hypothesized, greater psychophysiological affect was associated with correct feedback than with incorrect. This effect persisted across blocks of

trials. Further support of such findings have implications for management and supervision of sheltered and competitive employment. —*Journal summary.*

898. Wu, Wu-tien. [Discrimination learning in mentally retarded children as a function of rigidity tendency.] (Chin) *Bulletin of Educational Psychology*. 1974(Jun). Vol 7, 53-62. Investigated the function of rigidity tendency on the discrimination learning of mentally retarded children and surveyed the effect of original training on shifted learning. Ss were 24 mildly retarded children, equally divided by sex, with a mean CA of 141.9 mo and a mean MA of 103.8 mo. 2 sets of 2-choice "color-form objects" were presented by way of a discrimination apparatus devised by E. Percentages of stimulus preservation, number of position preference, and the difference between pre- and post-performance were then calculated for each S. Results show that (a) the stronger the rigidity tendency, the poorer the discrimination work; and (b) it became easier to learn intradimensional-shifted work after finishing original learning. (18 ref)—*Journal abstract.*

Speech & Language Disorders

899. McReynolds, Leija V. & Engmann, Deedra L. (U Kansas, Medical Ctr, Kansas City) **Distinctive feature analysis of misarticulations.** Baltimore, MD: University Park Press, 1975. xi, 130 p.—Applies linguistic theory and methodology in outlining procedures (a) to instruct speech pathologists to conduct a distinctive feature analysis of a child's misarticulations and (b) to demonstrate how information derived from the analysis can be used to develop systematic articulation training programs. (49 ref)

900. McReynolds, Leija V.; Kohn, Joan & Williams, Gail C. (U Kansas, Medical Ctr, Kansas City) **Articulatory-defective children's discrimination of their production errors.** *Journal of Speech and Hearing Disorders*, 1975(Aug), Vol 40(3), 327-338.—Analyzed discrimination and production performance of 7 severely misarticulating Ss (3.5-7.3 yrs of age) in terms of errors in distinctive features and phonemes. Performance on the McDonald Deep Test of Articulation and a minimal pairs discrimination test was also compared to the performance of Ss without articulation errors on the same measures. The normal Ss (5.8-8.9 yrs of age) performed equally well in production and discrimination. However, articulatory-error Ss performed poorly on the production test but performed almost as well as normal Ss on the discrimination test. A discrepancy in articulatory-error Ss' production and discrimination of their error phonemes was obtained. They discriminated features and phonemes they did not produce. Clinical relevance of the findings are discussed. (16 ref)—*Journal abstract.*

Physical & Psychosomatic Disorders

901. Araneta, Enrique et al. (U Florida) **Gilles de la Tourette's syndrome symptom onset at age 35.** *Child Psychiatry & Human Development*, 1975 (Sum), Vol 5(4), 224-230. Presents the case history of an adult male with Gilles de la Tourette's syndrome which deviates from previously reported cases in terms of the age of

onset. The primary factors influencing this case are judged to be psychological (i.e., the conditions resulted from threatening environmental events which caused repression). Drug treatments were ineffective, and group therapy appeared to be the most relevant treatment approach. (15 ref)—E. S. Goodman.

902. Babin, David E. (Seabury-Western Theological Seminary, Evanston, Ill) **Body awareness in the physically abnormal.** *Journal of Religion & Health*, 1975(Jul), Vol 14(3), 184-191.—3 attitudes (guilt, anger, and pride) held toward the bodies of physically disabled persons are discussed. It is maintained that physically disabled individuals pay more attention to their bodies and its limitations than do physically normal individuals. Also, more attention is given to the bodies of the physically disabled than to others (e.g., from physicians). It is concluded that both the ability to focus on one's body and to ignore one's body (as many normal people do), are valuable. It is argued that normals need to learn from the physically disabled regarding body awareness and vice versa.—F. Hardt.

903. Baider, Adela L. (Brandeis U) **Family structure and the process of dying: A study of cancer patients and their family interaction.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 421.

904. Camargo Lima, José G.; Pimentel, Pedro C.; Baptista da Silva, Ademir & Nóbrega, Joao A. (Escola Paulista de Medicina, Sao Paulo, Brazil) **[The electroencephalogram in the parkinsonian syndrome.]** (Port) *Arquivos de Neuro-Psiquiatria*, 1973(Sep), Vol 31(3), 188-191.—Studied EEG recordings of 50 parkinsonian patients with no convulsive antecedents, and found abnormalities in 20 cases. The incidence of abnormal records was larger in the bilateral parkinsonian syndrome than in the unilateral one (52% and 25% of the patients respectively). Paroxysmal abnormalities characterized mainly by bursts of theta waves were most frequent (13 cases). Sharp activity in the EEG patterns of 3 patients was prominent. Alternations of the base rhythm were recorded in 7 abnormal EEG cases. The patient's age did not seem critical in the genesis of EEG abnormalities.—*English summary.*

905. Chauvin, Ronald. **Psychosomatic symptom development and family survival concepts.** *Family Therapy*, 1972(Sum), Vol 1(1), 49-56. Examines survival concepts as they relate to psychosomatic illness. Psychosomatic symptoms develop as the result of the family behavioral system, its symptomatology, and its need for a survival system. The patient is caught between feelings of rage, fears of abandonment, fears of loneliness. Overtly, he presents a state of helplessness and hopelessness. Inner fear produces a state of panic, thus psychogenic symptoms may develop.—D. P. Judd.

906. Corey, Eleanor J.; Miller, Carol L. & Widlak, Frederic W. (Indiana U, Nursing School) **Factors contributing to child abuse.** *Nursing Research*, 1975(Jul-Aug), Vol 24(4), 293-295.—Compared background demographic characteristics and medical data of 48 hospitalized battered children with those of 50 hospitalized nonbattered children of the same age group (up to 6 yrs old). The average age of the battered children was 15.5 mo. Factors investigated included sibling presence, mother's marital status, and perpetra-

tor's sex. No differences were found between abused and nonabused children on any of these factors. Results call into question conclusions of other studies which have shown relationships between child abuse and demographic and medical history variables. (16 ref)—*Journal abstract*.

907. Defrenne, J. & Mertens, C. (U Catholique Louvain, Belgium) [Evaluation of psychological propensity to cardiovascular disease.] (Fren) *Acta Psychiatrica Belgica*, 1974(Mar), Vol 74(2), 134-175.—Reviews literature on personality traits indicative of a propensity for myocardial infarction. Studies of the "coronary-prone personality" are grouped by the methods they used: interviews, projective techniques, and personality inventories. A tabular presentation of the articles surveyed is included. It is concluded that coronary disorders are characteristic of Ss who tend to inhibit affect, are prone to over-activity, and have sedentary occupations. Despite a wealth of studies, definitive statements about the personality structure linked to coronary disorders—if it exists at all—cannot be made. (Dutch, English, German, Italian, & Spanish summaries)—E. Coché

910. Geiger, William J. (Family Practice Ctr, Akron, OH) **Behavioral perspectives in coronary care.** *Journal of Family Practice*, 1975(Aug), Vol 2(4), 245-248.—Interviewed 38 patients admitted to a coronary care unit (CCU) about their moods and understanding of their medical condition. A progression of moods from anxiety to denial to depression was noted, and only 7 of the 38 patients had a good understanding of their illness. Suggestions for improving patient care in CCUs are presented. (15 ref)

911. Gershen, Jay A. (U California, Los Angeles) **Galactosemia: A psycho-social perspective.** *Mental Retardation*, 1975(Aug), Vol 13(4), 20-23.—Reviews the literature, focusing on psychosocial aspects of galactosemia with emphasis on developmental, intellectual, visual-perceptual, emotional, social, and psychoeducational factors. After a brief biomedical orientation to the disease, several longitudinal studies are reviewed from a psychosocial perspective. These studies tend to indicate that much can be done for galactosemics in terms of early diagnosis and early diet intervention. The medical and psychosocial problems encountered by these patients require the efforts of a multidisciplinary team.—*Journal abstract*.

912. Gormanous, Gregory K. & Lowe, Warren C. (U Southern Mississippi) **Locus of control and obesity.** *Psychological Reports*, 1975(Aug), Vol 37(1), 30.—Administered Rotter's Internal External Control Scale (I E) to 20 obese and 44 normal female undergraduates and 30 obese and 26 normal male undergraduates. No significant differences in I E scores were found between the normal and obese groups or between males and females.

913. Guillaume, N.; Mertens, C.; Jacques, P. & Fefer, T. [Experience of stress, expressions of stress and cardiovascular disorders.] (Fren) *Acta Psychiatrica Belgica*, 1974(Mar), Vol 74(2), 119-133.—Studied 71 females (mean age = 32 yrs) and 107 males (mean age = 38 yrs) who had received a physical examination at their place of work. Some cases showed signs usually seen as indicative of coronary problems but none was sufficiently serious to necessitate therapeutic measures. All Ss also completed questionnaires dealing with indicators of stress in their occupational and family lives and questionnaires regarding physical symptoms of anxiety and stress (e.g., palpitations). A large number of correlations among these indicators and biological data were found, leading to the conclusion that the subjective experience of stress is rightfully seen as a precursor of potential coronary problems. (Dutch, English, German, Italian, & Spanish summaries)—E. Coché

914. Hackett, Thomas P. & Cassem, Ned H. (Massachusetts General Hosp, Boston) **Psychological management of the myocardial infarction patient.** *Journal of Human Stress*, 1975(Sep), Vol 1(3), 25-38.—Divides the acute coronary experience into 3 parts. In the 1st, the prehospital phase, attention is devoted to the widespread phenomenon of patient delay. Evidence is given to indicate that the source of delay is entirely psychological and centers around the inability to decide whether or not to seek help. The 2nd part, or hospital phase, describes the response of the patient to the various aspects of the coronary care unit, including monitoring, false alarms, and witnessing and sustaining a cardiac arrest. The 3rd phase, the posthospital convalescence, centers on what is considered the principal psychological problem of this period, depression. Its causes, manifestations, and methods of management are discussed. (20 ref)—*Journal abstract*.

915. Haslam, Robert H. (John F. Kennedy Inst, Baltimore, MD) **"Progressive cerebral palsy" or spinal cord tumor? Two cases of mistaken identity.** *Developmental Medicine & Child Neurology*, 1975(Apr), Vol 17(2), 232-237.—Describes the neurological findings and unusual manifestations in the cases of 2 children, 10½ and 11 yrs old, who had previously been diagnosed as having cerebral palsy and in both of whom an intramedullary tumor of the cervical cord was demonstrated.

916. Hutt, S. J. & Fairweather, Hugh. (U Keele, England) **Information processing during two types of EEG activity. Electroencephalography & Clinical Neurophysiology**, 1975(Jul), Vol 39(1), 43-51.—A 15-yr-old girl whose EEG contained frequent bursts of generalized subclinical spike-wave activity was examined on a paced serial-choice response task with simultaneous EEG control. The task was carried out at 3 different speeds and 3 different information loads. Performance was compared during paroxysms of spike-wave activity and during normal EEG background activity. 4 parameters of performance were compared, each parameter being somewhat differently affected by spike-wave activity. Response ambiguity was significantly increased in the presence of spike-wave activity, with a corresponding decrease in the amount of information transmitted. The absolute rate at which information could be transmitted in relation to presentation rate was consequently reduced.

during spike-wave activity, the effect being most marked at the intermediate speed of presentation (1 signal/2 sec). However, when signals were presented very slowly (1 signal/4), S's relative information transmitted during spike-wave activity approached that achieved under normal background conditions. Thus, accuracy of performance per se was not critically affected by spike-wave; rather it was the rate at which signals could be handled. Spike-wave may therefore be conceptualized as a form of "neural noise" whose effect is to reduce a S's channel capacity. (French summary) (20 ref)—*Journal summary*.

917. Kalkhof, Thomas C. (Iroquois Medical Ctr, Erie, PA) **The generalist and psychosomatic medicine.** *Psychosomatics*, 1975, Vol 16(1), 12-13. Proposes a continuing educational program for the nonpsychiatrist.

918. Karlsson, Kathryn A. (U Illinois, Urbana-Champaign) **Hyperactivity and environmental compliance.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 861-862.

919. Kraus, A. (U Heidelberg, Psychiatrische Klinik, W Germany) **[Alterations of perception and of body image in parkinsonism: A clinical contribution to the theory of unity of perception and movement.]** (Germ) *Nervenarzt*, 1974(Dec), Vol 45(12), 639-646.

920. Longo, Rosa H. & Camargo Lima, José G. (Escola Paulista de Medicina, Sao Paulo, Brazil) **[Sleep as an activator of the epileptic patient's electroencephalogram.]** (Port) *Arquivos de Neuro-Psiquiatria*, 1973(Sep), Vol 31(3), 180-183.—The EEG tracings of 1,868 epileptic patients (572 generalized seizures, 121 nonpsychomotor temporal, 118 psychomotor, 410 non-temporal focal, 314 nocturnal, 165 febrile, and 168 convulsive seizures associated with psychomotor retardation) were compared under conditions of wakefulness (rest and hyperpnea) and sleep (slow phase). No significant differences were found between tracings obtained during spontaneous sleep and medically induced sleep. In most cases, records obtained while the patients were asleep merely confirmed tracings made when they were awake. The activator action of sleep appeared in only a few cases, having its peak in the psychomotor seizure group (26%). In the generalized nonpsychomotor temporal, nontemporal focal, and nocturnal seizures, sleep acted as an antiactivator instead of an activator of the abnormalities recorded when the patients were awake. (19 ref)—*English summary*.

921. Martin, Maurice J. (Mayo Clinic & Foundation, Rochester, MN) **The role of psychiatric consultation in psychosomatic medicine.** *Psychosomatics*, 1975, Vol 16(1), 7-11. Points out the value of consultation in treating psychosomatic problems. After understanding the physician's needs, the consultant may employ special techniques, diagnose the problem, and make specific recommendations to be applied by the primary physician.

922. Martin, Pamela. I, too, want to be a real person. *Volta Review*, 1975(Sep), Vol 77(6), 375-380.—Reports the experiences of a mother in securing services for her deaf 11-yr old daughter. Early contact with clinics and recent provision of regular classroom placement seem to have been important in the child's attainment of active functioning.

923. McDougall, Joyce. **The psychosoma and the psychoanalytic process.** *International Review of Psycho-Analysis*, 1974, Vol 1(4), 437-459. Discusses the psychosomatic nature of man. The importance and the heterogeneous character of man's innate capacity for symbolic activity and physical creation are noted. The creative process is considered an attempt to maintain a form of psychic equilibrium under changing circumstances. Psychosomatic creations are the most mysterious, since they are the least appropriate to the desire to live. The psychoanalytic processes are viewed as the antithesis of psychosomatic processes. (22 ref)—*R. Tomasko*.

924. Mechanic, David. (U Wisconsin, Madison) **Some problems in the measurement of stress and social readjustment.** *Journal of Human Stress*, 1975(Sep), Vol 1(3), 43-48. Posits that, although the Social Readjustment Rating Scale has been a useful stimulant to the study of life change and illness, it has important limitations. The existing scale cannot be used to determine the role of varying types of life changes (e.g., favorable or adverse) in the occurrence of illness. Other problems discussed are ambiguity of items, the confounding of independent and dependent variables, and lack of item specification. Suggestions are made for improved measurement of life change and for more effective study of life change and illness.—*Journal abstract*.

925. Meyer, Jürgen G. & Meyer-Wahl, Lilli. (U Heidelberg, Abteilung für Anfallskrankheiten der Neurologischen, W Germany) **[The genesis of focal epileptic seizures initiated by seeing spatially patterned stimuli (pattern-sensitive epilepsy): With a case history.]** (Germ) *Nervenarzt*, 1975(Jan), Vol 46(1), 24-30.

926. Miller, Michael B. (White Plains Ctr for Nursing Care, NY) **Iatrogenic and nurisgenic effects of prolonged immobilization of the ill aged.** *Journal of the American Geriatrics Society*, 1975(Aug), Vol 23(8), 360-369.—Outlines the kinesio, psychopathologic, and psychosocial effects of prolonged immobilization of the ill aged. All patients were immobilized for at least 4 wks and some of them for 12 wks or longer. The iatrogenic (physician-induced) and nurisgenic (nurse-induced) factors related to such functional disabilities are described. Illustrative case histories are given. The syndrome is reversible. Thus physicians and nurses have a continued responsibility to support a sustained rehabilitation program for these patients. The biochemical effects of prolonged inactivity indicate that immobilization of the elderly patient results in adverse physical and psychological phenomena. (27 ref)—*Journal abstract*.

927. Mitsuyama, Yoshio. (Kokura National Hosp, Div of Neurology, Kitakyushu, Japan) **[Clinicopathological study of dementia due to cerebrovascular disease in presenium.]** (Jpn) *Kyushu Neuro-Psychiatry*, 1975, Vol 21(1), 21-36.—Presents results of clinicopathological studies of 5 cases of dementia (2 58-59 yr old females and 3 54-55 yr old males). Ss' hospital records were analyzed to determine their physical and neurological conditions; neuropathological examinations were also completed. Clinical results indicate that both the onset and the progress of the dementia were gradual. The neurological characteristics were similar to those of pre-

senile dementia: intellectual failure, unstable emotionality, reduced activity, euphoria, and abnormal behavior. Neuropathological results show that there were multiple microscopic infarcts and sclerotic changes in small arteries. The frontal lobe, corpus striatum thalamus, and cerebral white matter were abnormal and showed bilateral lesions. The vessels at the base of the brain were always very atheromatous. Findings suggest that hypertension and sclerosis of the small arteries are closely related to multiple brain lesions, and that there are possible relationships between the location of infarcts and the nature of psychiatric symptoms. (English summary) (44 ref)—S. Ashida.

928. Nickerson, Raymond S. (Bolt Beranek & Newman, Inc, Cambridge, MA) **Characteristics of the speech of deaf persons.** *Volta Review*, 1975(Sep), Vol 77(6), 342-362.—Reviewed speech characteristics typically found in the deaf. Results indicate that their speech is slower, especially unstressed syllables, with more pausing. Rhythm, breath control, and timing of articulatory movements are poor. Higher average pitch and insufficient or erratic pitch variation are often present. There is improper velar control, resulting in hyponasality or hypernasality. Articulatory errors of various kinds are identified. Voice quality and loudness may appear abnormal. (5 p ref)—W. A. Hass.

929. Seelig, Mildred S.; Berger, Adolph R. & Spielholz, Neil. (Goldwater Memorial Hosp, New York, NY) **Latent tetany and anxiety, marginal magnesium deficit, and normocalcemia.** *Diseases of the Nervous System*, 1975(Aug), Vol 36(8), 461-465.—Presents a preliminary report suggesting the need for further consideration of the possibility that chronic magnesium-deficit may contribute to the syndrome of latent tetany, psychosomatic complaints, and weakness. A case report is presented. (44 ref)

930. Stebbins, W. C.; Emmel, A.; Heriot, J. T. & Rockowitz, R. J. (U Rochester, Medical & Dental School) **Congenital ophthalmoplegia and school achievement: A case study.** *Developmental Medicine & Child Neurology*, 1975(Apr), Vol 17(2), 237-243. Presents the case of a 6½-yr-old male with the Moebius syndrome with severely restricted horizontal eye movements. Visuomotor integration was found to be at the age-level of 3 yrs, perceptual development at 4 yrs 10 mo, and cognitive functioning in the low dull-normal range. Achievement in arithmetic and reading was in line with cognitive ability. (French, German, & Spanish summaries)—P. W. Pruyser.

931. Theorell, Töres & Rahe, Richard H. (Karolinska Inst, Serafimerlasarettet, Stockholm, Sweden) **Life change events, ballistocardiography and coronary death.** *Journal of Human Stress*, 1975(Sep), Vol 1(3), 18-24. 36 men and women (mean age, 53 yrs) who experienced a documented myocardial infarction, ½ of whom ultimately died from their disease and ½ of whom survived over a 6-yr period, provided longitudinal recent life changes and ballistocardiographic data. The Ss who died from their coronary disease indicated a significant buildup in life changes which peaked approximately 1 yr prior to death; their serial ballistocardiograms indicated a significant buildup in average force of contraction which was seen to peak approximately 6 mo prior to

death. The postinfarction Ss who survived the 6-yr follow-up showed neither a buildup in life change nor a buildup in the ballistocardiographic index of cardiac contraction force. These findings of a life change peak preceding ballistocardiographic evidence of an "over-worked" heart are discussed in terms of their possible medical and psychophysiological significances. (15 ref)—*Journal abstract.*

932. Trombini, Giancarlo & Lanfranchi, Giorgio A. (U Bologna, Istituto di Psicologia, Italy) **Recordings of gastric and colonic motility during experimental conflicts in psychosomatic patients.** *Giornale Italiano di Psicologia*, 1974(Dec), Vol 1(3), 331-353.—Hypothesized that the psychovisceral reaction test by G. Trombini (1972), which involves the solution of puzzles of varying difficulty, provokes a significant disassociation of the gastric motorsecretory functions in patients with duodenal ulcer. Ss were 36 23-67 yr old inpatients with psychosomatic diseases of the digestive tract. The motor modifications induced in the stomach and in the sigmoid colon were compared with motor activity recorded during execution of Trombini's puzzles P1 and P3, which have different grades of difficulty. Results show that the conflict induced by P1 and P3 inhibited gastric motility (with an increase of hydrochloric acid) and increased sigmoid motility ($p < .005$). In Ss with gastrocolopathy or colopathy, P1 distinguished different types of diseases in relation to different functional behaviors. Results with this puzzle support the hypothesis. It is concluded that the test of psychovisceral reactivity may be useful for research in gastrointestinal psychomotility. With the test, it is possible to investigate the threshold of the somatic response to the psychic tension in individual patients and to examine different responses in relation to the personality of the patient. (Italian summary) (34 ref)—*Journal abstract.*

933. Violon, A. & de Mol, J. [Neuropsychological study of short-term evolution of brain trauma.] (I-ren) *Acta Psychiatrica Belgica*, 1974(Mar), Vol 74(2), 176-232.—27 males and 4 females who were hospitalized after a brain trauma, were given a battery of psychomotor, intelligence, and projective tests soon after recovering consciousness and again after 1, 3, and 6 mo. In the 1st testing deficits of attention and memory were prominent, whereas body coordination and arithmetic reasoning were not disturbed significantly. After 1 mo, difficulties of concentration, psychomotor retardation, imprecision, and tiredness stood out as major problems which were linked to the seriousness of the trauma. Most patients were much improved after 3 mo, but many were quite critical of themselves. Memory problems and neurotic symptoms were quite noticeable in some. At the 6-mo testing, approximately ½ of the patients had recovered in their cognitive functioning, but many still had difficulties in the affective sphere. Recommendations for post-traumatic psychological care are made. (Dutch, English, German, Italian, & Spanish summaries) (4 p ref) *E. Caché*

934. Woolsey, Robert M. & Nelson, James S. (St Louis U, Medical School) **Asymptomatic destruction of the fornix in man.** *Archives of Neurology*, 1975(Aug), Vol 32(8), 566-568. Notes that in 5 previous reports dealing with the effects of interruption of the fornix in man, 2

noted that a severe disturbance of recent memory resulted, and 3 indicated that no symptoms were evident. The present report describes a patient, without any apparent neurological or psychological disturbances, in whom a malignant tumor had destroyed the fornix bilaterally.

935. Yanagisawa, S. (Yamaguchi U, Medical School, Ube, Japan) **Hermaphroditism associated with unusual gonadal finding in a mentally retarded child.** *Journal of Mental Deficiency Research*, 1975(Mar), Vol 19(1), 37-42.—Presents the case of an hermaphrodite, a mentally retarded 13-yr-old male with undifferentiated gonads. Chromosome analysis revealed a 46,XX female karyotype.

936. Yoshida, Hozuka. (Kyushu U, Faculty of Medicine, Fukuoka, Japan) **[A clinico-electroencephalographic study of laughing attacks.]** (Japn) *Kyushu Neuro-Psychiatry*, 1975, Vol 21(1), 52-59.—Conducted clinical and encephalographic studies with a 44-yr-old male epileptic whose laughing fits were caused by aseptic meningoencephalitis. 5 types of clinical seizures were observed: grimacing and laughing fits, gestural automatism of the upper limbs, tonic generalized seizures, and tonic-chronic generalized seizures. During the grimacing fits, a rhythmic theta activity occurred in the left hemisphere. During the laughing fits, the EEG displayed bilaterally diffused irregular slow activity with asymmetry, followed by generalized seizures. It is concluded that laughing fits are not a postictal phenomenon but a kind of ictal automatism. (English summary) (25 ref)—S. Ashida.

937. Zakrisson, J.-E.; Borg, E.; Diamant, H. & Moller, A. R. (U Umea, Sweden) **Auditory fatigue in patients with stapedius muscle paralysis.** *Acta Oto-Laryngologica*, 1975(Mar-Apr), Vol 79(3-4), 228-232.—Conducted experiments in 18 patients with peripheral facial palsy (Bell's palsy) including unilateral stapedius muscle paralysis. After exposure to narrow band noise centered at 0.5 kHz, temporary threshold shift (TTS) at 0.75 kHz was significantly higher in the ear with paralysis than in the normal ear. After exposure to 2 kHz narrow band noise there was no difference in TTS at 3 kHz between affected and nonaffected ears. It is concluded that the stapedius reflex has a protective function against low frequency sound exposure and that this protection might be extended to higher frequencies only when high frequency noise also contains low frequency components. (German summary)—*Journal abstract*.

938. Zarinsky, Irma. (Union Hosp, Lynn, MA) **Psychological problems of kidney transplanted adolescents.** *Adolescence*, 1975(Spring), Vol 10(37), 101-109.—The adolescent is in a traumatic, crisis-provoking period of growth. It is worse for the hospitalized or chronically ill adolescent who faces loss of autonomy, isolation, feelings of depersonalization, retardation of sexual identity or similar emotional problems. If the adolescent has undergone a kidney transplant many more problems must be faced. Rehabilitation success has not been shown for adolescents who are hampered by their physical and psychological limitations. (41 ref) A. Krichew

939. Zeuthen, Eva; Hansen, Mariann; Christensen, Anne-Lise & Nielsen, Johannes. (Aarhus State Hosp,

Cytogenetic Lab, Risskov, Denmark) **A psychiatric-psychological study of XYY males found in a general male population.** *Acta Psychiatrica Scandinavica*, 1973(Jan), Vol 51(1), 3-18.—Psychological test results of 5 XYY males found in a population of 3,840 males registered for military service in Denmark show an intellectual level within the normal range but with a mean full scale IQ and educational level lower than expected. The cognitive and emotional functions were characterized by immaturity, manifested in passivity, unreflectiveness, and emotional lability, in 3 resulting in uncontrolled aggressive outbursts. Conflict material also appeared immaturely resolved, centering around unfulfilled needs of contact and insecure masculine identification. Defense mechanisms used were generally rather weak, but only in 1 S did the anxiety level seem to be excessively low. Case studies are presented. All 5 Ss differed to a certain extent from their siblings; 3 were hyperactive, restless, hot-tempered, and impulsive at school, and 4 had difficulties at school. 3 learned a trade, but only 1 stayed in his trade, and 1 was applying for disablement pension on account of personality deviation. 2 had a criminal record. It is concluded that the presence and degree of the above characteristics of XYY males varied. It is evident that environmental factors play as great a role for the development of personality and behavior in males with karyotype 47,XYY as in males with a normal chromosome constitution.—*Journal abstract*.

TREATMENT AND PREVENTION

940. Agren, Hans. (U Uppsala Hosp, Sweden) **A new approach to Chinese traditional medicine.** *American Journal of Chinese Medicine*, 1975(Jul), Vol 3(3), 207-212.—Argues that traditional Chinese medicine should be analyzed from psychological and anthropological perspectives and according to its subspecialties, levels of knowledge, and sociological and historical divisions. Traditional medicine involves counseling and creation of a milieu of trust; with this in mind, it is possible to understand today's integration of traditional and modern medicine in China.

941. Green, Bonnie L.; Gleser, Goldine C.; Stone, Walter N. & Seifert, Rita F. (U Cincinnati, Medical Coll) **Relationships among diverse measures of psychotherapy outcome.** *Journal of Consulting & Clinical Psychology*, 1975(Oct), Vol 43(5), 689-699.—Conducted a study concerned with relationships among 3 different methods of evaluating psychotherapy outcome: final status scores, pretreatment to posttreatment difference scores, and direct ratings of global improvement. 50 outpatients with acute stress reaction were seen by 7 therapists for approximately 6 wks of brief crisis-oriented treatment. Pre- and posttherapy status measures consisted of the Symptom Check List, filled out by the S, and the Psychiatric Evaluation Form and the Hamilton Depression Rating Scale filled out by a research psychiatrist. These measures were oriented primarily toward symptomatology and daily functioning as deemed appropriate for a brief-treatment service. Ratings of global improvement were also available from the therapist and the S.

Generally, final status measures correlated highly with each other and also with the direct improvement ratings. Global improvement ratings were not related to initial scores. Use of difference scores tended to obscure convergence of posttreatment measures. Similarities and differences among these relationships and those previously reported in the literature are discussed, and inferences are drawn concerning optimal methods of evaluation. (32 ref)—*Journal abstract*.

942. Hahn, P. & Mayer, H. (Medizinischen Universitätsklinik Heidelberg, W Germany) [Telemetry used with psychosomatic disturbances.] (Germ) *Praxis der Psychotherapie*, 1974(Aug), Vol 19(4), 146-159.

943. Hindi-Alexander, M. The team approach in asthma. *Journal of Asthma Research*, 1974(Dec), Vol 12(2), 79-88.—The multidisciplinary approach to asthma is needed because the incidence of the disorder and the death rate from it are increasing. The literature on etiology and incidence is reviewed and various forms of treatment are discussed, with emphasis on the need to consider emotional as well as physiological factors. The treatment team, especially for a child, should include allergist, pediatrician, nurse, social workers, psychologist, physical therapist, psychiatrist, occupational therapist, recreational worker, teacher, dietician, speech and hearing therapists, and the child's parents. A number of successful team treatment programs in the US are cited. (42 ref)—*E. S. Bishop*.

944. Kafka, J. (U Pavla Jozefa Safárika, Psychiatrická klinika Lekárskej faculty, Košice, Czechoslovakia) [The possibility of experimental thinking in psychiatry.] (Czec) *Ceskoslovenská Psychiatrie*, 1974(Jun), Vol 70(3), 182-185.—Analyzes the concept of "experimental thinking" and discusses its possible use in psychiatry. It is explained that the method signifies imagining experiments carried out with ideal objects under ideal experimental conditions. The experiment is induced in thinking (intrapsychically), not performed in reality. In psychiatry, experimental thinking should achieve theoretical evaluation of empirical facts and generate new hypotheses and theories about psychopathologies. French, Russian, and Czech literature is quoted. (Russian & English summaries)—*V. Fischman*.

945. Kiev, Ari. (Cornell U Medical Coll, New York, NY) Psychotherapeutic strategies in the management of depressed and suicidal patients. *American Journal of Psychotherapy*, 1975(Jul), Vol 29(3), 345-354. Describes a crisis intervention therapy program for the management of depressed, suicidal patients. This approach combines chemotherapy with supportive psychotherapy. Symptoms are reduced through the use of fast-acting drugs. Audiotaped material is then employed to help patients acquire new strategies for daily living, including (a) setting personal goals and adopting a lifestyle, (b) techniques for self-mastery; (c) identifying stresses, problems, and psychological traps; and (d) gaining awareness of automatic behavior patterns which create conflict. A discussion of the rationale of this approach emphasizes the explosive and unpredictable interpersonal world of suicidal patients and the attitudes of patients and significant others toward the sick role.—*Journal summary*.

946. Klein, Beatrice & Mordock, John. (Astor Home for Children, Rhinebeck, NY) A guide to differentiated developmental diagnosis with a case demonstrating its use. *Child Psychiatry & Human Development*, 1975 (Sum), Vol 5(4), 242-253.—Introduces a guide for developmental diagnosis covering 5 aspects of development: main focus of satisfaction, relationships, nature and sources of disturbances that interfere with adaptation and development, and ego development. In each area, 4 successive phases are described, corresponding to the psychosexual phases normally expected to occur at ages 0-1½, 1½-3, 3-6, and 6-10 yrs. In assessment, the clinician should decide at which one of the 4 levels in each of the 5 areas the patient is functioning. A case history is presented to demonstrate use of the guide.—*E. S. Goodman*.

947. Lesse, Stanley. The range of therapies in the treatment of severely depressed suicidal patients. *American Journal of Psychotherapy*, 1975(Jul), Vol 29(3), 308-326.—Discusses basic requirements for managing severely depressed, suicidal patients. 5 distinct phases of treatment, each with its own specific therapeutic aim, are outlined. The advantages and limitations of ECS treatment, antidepressant drug therapy, and psychoanalytically oriented psychotherapy are considered. The clinical decision as to when patients may be treated on an outpatient basis and when they should be hospitalized is discussed. It is suggested that a suicide attempt by a patient in active treatment may often be the psychotherapist's fault. A new technique combining a drug and psychotherapy is described and explicit guidelines for ECS treatment are presented. (20 ref)—*Journal summary*.

948. Nielsen, H. Birk & Kampp, E. (Eds). (Bispebjerg Hosp, State Hearing Ctr, Copenhagen, Denmark) Visual and audio-visual perception of speech. *Scandinavian Audiology*, 1974, Suppl 4, 290 p.—Presents papers from the Sixth Danavox Symposium held in Denmark in 1974. Among the topics discussed are auditory and audiovisual speech perception related to hearing disorders, visual perception of speech by deaf children, lipreading with visual and tactual aids, construction and evaluation of an audiovisual test (the Helen test), and auditory and visual contributions to the perception of English consonants for normal and hearing-impaired listeners.

949. Pannacker, Mary. (Texas Women's U, Speech & Hearing Clinic) Diagnostic report writing. *Journal of Speech & Hearing Disorders*, 1975(Aug), Vol 40(3), 367-379.—Reviews purposes and types of diagnostic reports, and provides guidelines for report writing. Report writing varies depending upon the examination and the clinician's style of reporting. Such variation is acceptable so long as professional standards are maintained. Basic guidelines are given (a) The organization should provide for easy retrieval of specific information. (b) Terms and categories should be free of ambiguity. (c) Only terms in common use by professionals should be used. Lack of uniformity, inappropriate terminology, and overstatements are the basic problems of report writing that may be overcome through practice courses, and the study of sample reports. (30 ref) *Journal abstract*.

950. Sen, Arun K. (U. Alabama) Mental retardation in India: A short description. *Mental Retardation*.

1975(Aug), Vol 13(4), 11-13.—Reports that about 4% of the Indian population are mentally retarded. There are 85 known institutions in the entire country providing 4,000 beds for a population of 22 million retarded persons. Pioneering work in the field of retarded care started in Bombay and has expanded to other cities. The Federation for the Welfare of the Mentally Retarded (India) is a voluntary organization with a special technical cell of psychologists and other specialists to coordinate and promote research. It is concluded that, although there has been an expansion during the last decade, the problem has yet to be met effectively at the national level.—*Journal abstract*.

951. Stach, Thomas W. (Private practice, Oak Brook, IL.) **A guide to the use of Procedural Terminology for Psychiatrists.** *American Journal of Psychiatry*, 1975(Aug), Vol 132(8), 856-858. Discusses the potential benefits to patients, physicians, and 3rd-party payers from systematic specification of services rendered by psychiatrists in direct patient care. *Procedural Terminology for Psychiatrists*, published by the American Psychiatric Association and the American Medical Association, provides a reporting system that appropriately reflects variations in skill, complexity, and levels of patient care services.

952. Storm, Roger L. (U Missouri, Columbia) **A study of the comparability of selected family behaviors in the home and clinic setting.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1088-1089.

953. Williams, David V. (U Tulsa) **A study of existential philosophy and its relationships to principles of counseling.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1091.

Psychotherapy & Psychotherapeutic Counseling

954. Abu-Saba, Mary B. (U Illinois, Champaign-Urbana) **The female juvenile delinquent.** *Transactional Analysis Journal*, 1975(Jan), Vol 5(1), 62-65.—Discusses the therapeutic implications of females being treated under a double standard in the American juvenile correctional system. The success of transactional analysis with delinquents is attributed to its use of the attitude "I am responsible for my life. I will not let others be in charge." Therapists are encouraged to be knowledgeable about the pitfalls of the socio-legal framework which categorizes a female "delinquent," and to be sensitive to the ways a female declares herself "delinquent." —R. Tomasko.

955. Ammon, Günter. (Deutsche Akademie für Psychoanalyse, Berlin, W. Germany) **[What is psychoanalytic therapy?]** (Germ) *Nervenarzt*, 1975(Jan), Vol 46(1), 11-17.

956. Aubin, Bernard. **[Directed-reverie therapy considered as deriving from the psychoanalytically oriented psychotherapies.]** (Fren) *Etudes Psychoanalytiques*, 1974(Sep), No 17, 161-166. Argues that directed-reverie therapy should be considered as an analytic psychotherapy, but one that makes use of imaginal productions which lie at the boundary between the conscious and the unconscious and thus lend themselves to the achievement of synthesis.

957. Auerwald, Mary C. (Purdue U) **Differential reinforcing power of interpretation and restatement on**

client production of affect. *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 128.

958. Breggin, Peter R. (Ctr for the Study of Psychiatry, Washington, DC) **Psychiatry and psychotherapy as political processes.** *American Journal of Psychotherapy*, 1975(Jul), Vol 29(3), 369-382.—Discusses psychotherapy as a form of applied politics. It is suggested that a therapist's every action, from hospitalizing a patient to offering psychoanalytic insight, reflects his own political attitudes. This thesis is elaborated in terms of a number of issues including individual freedom vs state control, capitalism vs socialism, and institutional therapy vs private practice. It is concluded that ultimately every therapy implements some utopian political vision against which the client will measure his own success and failure in the therapy. (17 ref)—*Journal summary*.

959. Brenner, Charles (Ed.). **Alterations in defenses during psychoanalysis.** In B. D. Fine & H. F. Waldhorn (Eds.), *Alterations in defenses during psychoanalysis. Aspects of psychoanalytic intervention*. New York, NY: International Universities Press, 1975. xi, 97 p.—Presents 2 case examples illustrating ego functions serving as executants of drive derivatives as well as defenses against them.

960. Danis, Juana. **[The psychotherapeutic connection.]** (Germ) *Praxis der Psychotherapie*, 1974(Aug), Vol 19(4), 137-145. Presents a philosophical discussion of the psychotherapeutic interaction between the patient and the therapist.

961. Davis, Jannar W. (U Florida) **Behavior charting as an adjunct to the dyadic counseling relationship.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 132-133.

962. de M'Uzan, M. **Analytical process and the notion of the past.** *International Review of Psychoanalysis*, 1974, Vol 1(4), 461-466.—The notion of analytical process is used to designate a creation in the literal sense of the word. This process concerns the identity of the transference neurosis, which is distinguished from transference itself, and types of patients for whom the analytic process is ineffective are described. A relationship is drawn between the psychical work the patient accomplishes when he constructs his past and the work that takes place during analysis. —R. Tomasko.

963. de Peretti, André [Rogers, the man, his thought, his method.] (Fren) *Etudes Psychoanalytiques*, 1974(Sep), No 17, 149-158.—Traces the development of client-centered therapy, focusing on C. Rogers' book, *Client-Centered Therapy* (1951). The warm involvement of the therapist with the client, the handling of transference in client-centered therapy, Rogers's use of existentialist ideas and his research on the psychotherapy of schizophrenia are discussed. (39 ref)—F. Auld.

964. Dickson, Charles. (Lenoir Rhyne Coll) **Logotherapy as a pastoral tool.** *Journal of Religion & Health*, 1975(Jul), Vol 14(3), 207-213.—Discusses the logotherapy methods employed by Victor Frankl and additional methods which religious ministers can use in their mental health work. It is argued that the logotherapy uses human nature and potentialities and that transcendence must be more fully provided to religiously oriented clients by clergymen since it cannot be provided by logotherapists.—F. A. Hardi.

965. **Dodd, Frances G.** (George Washington U) **Art therapy with a brain-injured man.** *American Journal of Art Therapy*, 1975(Apr), Vol 14(3), 83-89.—Discusses the artwork of a 24-yr-old male who suffered diffuse, concussive brain injury in a car accident. As he progressed toward normal consciousness his empty, simple pictures became more unified and colorful. 2 aspects of his drawings are examined: (a) his repeated theme of broken land, which is seen as a symbol of the disorientation stemming from his brain damage, and (b) the concept of body image, which is related to the figures in the drawings. It is noted that the primary benefit of art therapy is the relationship established with the therapist. —*R. Tomasko*.
966. **Dreyfus, L. & Cordier, M. L.** (Hôpital Esquirol, St Maurice, France) [An experiment in classroom therapy.] (*Fren*) *Information Psychiatrique*, 1975(Feb), Vol 51(2), 151-155. Describes an informal experiment in which psychiatric patients were offered strictly scheduled academic courses in an attempt to prepare them for adjustment to schedules and information processing when they returned to their professional jobs after treatment.—*C. A. Sherrard*.
967. **Fabre, Nicole.** [The emergence of archaic images in the therapy of Nadine.] (*Fren*) *Etudes Psychotherapeutiques*, 1974(Sep), No 17, 139-146.—Uses the case of an 8-yr-old female at the beginning of psychotherapy as a basis for a discussion on the emergence of archaic images during directed-reverie therapy.
968. **Fierz, H. K.** [Methods, theories and ethics in analytical psychotherapy.] (*Germ*) *Analytische Psychologie*, 1975, Vol 6(1), 64-76.—Discusses the importance of formal time order in analysis, disturbances resulting from the analyst's prejudices, influence of transference projection, the danger of being on familiar terms with the analysand, the analyst's personal ethical attitude, and mistakes in analysis. The advantages and disadvantages of psychological theories are also discussed.—*S. D. Babcock*.
969. **Fine, Bernard D. & Waldhorn, Herbert F.** (Eds). **Alterations in defense during psychoanalysis. Aspects of psychoanalytic intervention.** New York, NY: International Universities Press, 1975. xi, 97 p.
970. **Getsinger, Stephen H.** (Perry Point VA Hosp. Psychology Service, MD) **Pastoral counseling and the combat veteran.** *Journal of Religion & Health*, 1975(Jul), Vol 14(3), 214-219.—Presents a case report to demonstrate common behavioral reactions (e.g., fatigue, self-deprecation, sudden changes in interests, and hypersensitivity) experienced by returning veterans. It is suggested that "home" clergy offer a supportive relationship in such cases and emphasize (a) the resumption of activities; (b) reassurances; (c) permissive ventilation in counseling; (d) readjustments to the community, beginning with the church community; and (e) referrals when needed. A list of behavioral symptoms are provided in which speedy referral for psychological help is indicated.—*F. A. Hardt*.
971. **Green, André** **Surface analysis, deep analysis: The role of the preconscious in psychoanalytical technique.** *International Review of Psycho-Analysis*, 1974, Vol 1(4), 415-423.—Discusses the role of an implicit theoretical model in analytical technique. The aim of analysis is considered to be the preparation of the patient for self-analysis. Topics discussed include the mediatory and transitional aspects of the preconscious, the importance of silence, and associating. It is argued that the preconscious is neglected space where both patient and analyst can meet to experience transference and go forward together.—*R. Tomasko*.
972. **Grinberg, Leon & Grinberg, Rebeca.** **The problem of identity and the psychoanalytical process.** *International Review of Psycho-Analysis*, 1974, Vol 1(4), 499-507.—Views identity as the outcome of the continual interaction of 3 integration links: spatial, temporal, and social. These links operate simultaneously and enable the individual to join with external objects. Their development in the patient-analyst relationship is described, stressing the way this development leads to consolidation of the sense of identity. (20 ref)—*R. Tomasko*.
973. **Haimowitz, Carla.** **Structure.** *Transactional Analysis Journal*, 1975(Jan), Vol 5(1), 42-50.—Describes ways of structuring a therapeutic problem-solving situation so that the individual will use the space available to act out alleged "not-OK" behaviors and get the responses needed to complete growing up. 2 therapeutic exercises are described illustrating the importance of structure.
974. **Haimowitz, Natalie.** **Protection.** *Transactional Analysis Journal*, 1975(Jan), Vol 5(1), 51-54.—Discusses common pitfalls in offering and obtaining transactional analysis therapy. Overconcern with professional status, exclusively blaming oneself or society for one's problems, overemphasizing the "rules" of transactional analysis, and arousing archaic Child feelings are discussed.
975. **Hendin, Herbert.** (Ctr for Policy Research, New York, NY) **Growing up dead: Student suicide.** *American Journal of Psychotherapy*, 1975(Jul), Vol 29(3), 327-338.—Presents several brief case studies of college students who have made serious suicide attempts. Short-term therapy was employed in most of these cases; long-term therapy in some. Discussion of the clinical histories deals with (a) the psychodynamic significance of suicide, (b) family constellations that produce suicide, (c) psychosocial forces contributing to the rise of the suicide rate in young people, and (d) special problems in treating severely suicidal young persons. It is hypothesized that these students are tied to their parents in a death knot and become overtly suicidal when life (entering college, graduating, involvement with others) threatens to unravel this knot.—*Journal summary*.
976. **James, Norman.** (St John's U, Collegeville, MN) **To catch a Honkie (or get caught!)** *Transactional Analysis Journal*, 1975(Jan), Vol 5(1), 57-59. Discusses the problem of determining where some Black persons are coming from in therapeutic situations. Emphasis is placed on behaviors that have a "Black is better than White" payoff.
977. **Major, René** **The language of interpretation.** *International Review of Psycho-Analysis*, 1974, Vol 1(4), 425-435. Discusses the need for interpretation operating in the primary as well as secondary processes. Interpretation retains elements of discontinuity within the continuity it establishes, and is the symbolic

realization of a wish. The rules that regulate the use of language in interpretation are discussed in order that the possible temptations of domination and suggestion may be avoided in the analytic relationship. (16 ref.) *R. Tomasko.*

978. Maurey, Gilbert. [The mother and her poisons.] (Fren) *Etudes Psychotherapeutiques*, 1974(Sep), No 17, 123-126, 129-137.—Describes the therapy of a railway trainman who feared that he would throw himself under a train and that he would harm his wife and his son. Directed-reverie therapy made him aware that he had always sensed that his mother had not wanted him and that she had seized on the pretext of wartime conditions to abandon him to the care of an aunt and uncle. The importance of language, transference, and corrective emotional experience in the therapeutic process is emphasized.—*F. Auld.*

979. Mendel, Werner M. (U Southern California, Medical School) Interpretation and working through. *American Journal of Psychotherapy*, 1975(Jul), Vol 29(3), 409-414. Discusses the hypothesis that interpretation leading to insight is partially independent of content. This process consists of the assignment of meaning rather than finding meaning. Insight binds anxiety, lifts repression, and relieves neurotic symptoms, regardless of its accuracy or correctness, as long as the content is acceptable to the life patient. Working through is learning to apply the assigned meaning to new situations. The more active the patient and the less active the therapist, the more permanently the assigned meaning changes the of the patient. 5 steps of working through process are described.—*Journal summary.*

980. Munro, Josef N. & Bach, Thomas R. (Catholic U of America) Effect of time-limited counseling on client change. *Journal of Counseling Psychology*, 1975(Sep), Vol 22(5), 395-398. 24 college-student clients seeking help from a counseling center for emotional or personal-social problems were randomly assigned to 1 of 2 treatment conditions: time-limited or undetermined-time counseling. Pre- and postcounseling measures were obtained relating to client status and problems. These included the Personal Orientation Inventory and Strupp's therapist questionnaire. Findings indicate significant improvement in terms of self-acceptance and increased independence as well as on various other self-report statements for clients in the time-limited group over a period of 8 wks. In addition, assessment by clients and the 15 counselors of improvement in both groups was significantly related. Implications of findings in terms of use of time-limited counseling in a time-limited environment, e.g., college counseling centers, are discussed. (19 ref.)—*Journal abstract.*

981. Ploeger, A. (Rheinisch-Westfälische Technische Hochschule, Medizinischen Fakultät, Aachen, W Germany) [In-hospital and outpatient group therapy and sociotherapy.] (Germ) *Nervenarzt*, 1975(Jan), Vol 46(1), 18-23.

982. Rose, Gilbert J. Some misuses of analysis as a way of life: Analysis interminable and interminable "analysts." *International Review of Psycho-Analysis*, 1974, Vol 1(4), 509-515. Discusses the exploitation of analysis by character pathology, especially when there is an unconscious collusion with the analyst's need for

narcissistic invulnerability or faith in analysis as a way of life. The dangers of the analysis as a way of life and a personal style is described, and the manner in which analytic antipathy toward acting out is used to justify inaction in such situations is noted.—*R. Tomasko.*

983. Rotenberg, Mordechai. (Hebrew U, School of Social Work, Jerusalem, Israel) The Protestant ethic against the spirit of psychiatry. The other side of Weber's thesis. *British Journal of Sociology*, 1975(Mar), Vol 26(1), 52-65.—Discusses apparent conflict in basic assumptions underlying professional people-changing treatment systems (psychotherapy) and the Protestant ethic belief in man's inability to change should be equally rooted. Predestination and dualism (i.e., people are either evil or good) are at odds with the people-changing concept of modern psychotherapy. The therapist's traditional preference for treating neurotics and his reluctance to treat psychopaths and psychotics may reflect influence of concepts drawn from the Protestant ethic. (2 p ref.)—*R. P. Abeles.*

984. Rubenstein, Ben & Levitt, Morton. (U California, Medical School, Davis) Therapeutic systems and moral assumptions. *International Review of Psycho-Analysis*, 1974, Vol 1(4), 481-488.—Considers that the loss of traditional values and family structure produces a societal "why not" reaction which is supported by several therapeutic schools. The therapist's use of transference provides information about his attitude toward patient independence, liberation, and mastery of reality. The issue of sexual relations between therapist and patient is discussed, and the consequences of the analyst's yielding to the patient's infantile needs are noted. (17 ref.)—*R. Tomasko.*

985. Salant, Edna G. (National Child Research Ctr, Washington, DC) Preventive art therapy: With a preschool child. *American Journal of Art Therapy*, 1975(Apr), Vol 14(3), 67-74.—Discusses a preventive art therapy program for 150 normal children, 2 1/2-7 yrs old at the National Child Research Center. A case example of a gifted 5 1/2-yr-old daughter of a separated couple is presented to illustrate the effectiveness of art therapy in recognizing and dealing with problems before they become acute. Several of the girl's pictures, and an interpretation of their significance with regard to her parent's separation, are included. Differences between art in the classroom and art in a therapeutic setting are noted.—*R. Tomasko.*

986. Taylor, Clarence E. (U South Carolina) Counselor's level of empathic understanding as a function of counselor sex and client sex. *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 143.

987. Uemura, Akira. (Fukuoka U, Faculty of Medicine, Japan) [On a course of a therapy for a self-destructive female student.] (Jpn) *Kyushu Neuro-Psychiatry*, 1975, Vol 21(1), 37-42.—Reports the results of therapy (1 50-min period per week for approximately 11 mo) given to a 17-yr-old high school female student who had homosexual tendencies and who repeatedly cut her own forearm. Results suggest that her undesirable behavior was based on the peculiar psychodynamics of her abnormal family situation, in which her mother suppressed her own sexual feelings, over-respected her father, and badly despised her own husband. The patient

identified herself with her mother, tried to deny her sexual drives, and directed her sexual impulses toward her mother in such a way that her own skin became an erogenous zone. As she started to conceptualize and to communicate with the opposite sex, her abnormal behavior patterns disappeared. The evidence suggests that the S's self-destructive behavior and homosexual tendencies were closely related to her identity problems. (English summary)—S. Ashida.

988. Viderman, Serge. Interpretation in the analytical space. *International Review of Psycho-Analysis*, 1974, Vol 1(4), 467-480.—Discusses the theory of transference technique and the development of transference reactions. 4 stages of transference are described: a pretransference state, sparse transference reactions, actual transference, and the transference neurosis. 8 rules defining the construction of an analytic space and the unfolding of an authentic psychoanalytic process are presented.—R. Tomasko.

989. Vogt, Rolf. (U Heidelberg, Psychosomatische Klinik, W Germany) [Psychoanalytically-oriented "short" and "focal" therapy.] (Germ) *Nervenarzt*, 1975(Jan), Vol 46(1), 1-10.—Presents a survey of this type of therapy, with a case history. (52 ref)—J. Rutschmann.

990. Wadson, Harriet. (Montgomery Coll) **Suicide: Expression in images.** *American Journal of Art Therapy*, 1975(Apr), Vol 14(3), 75-82.—Presents a selection of suicidal artwork created by depressed and manic inpatients during therapy sessions with the authors. Because recognition of suicidal wishes is essential in suicide prevention, art therapy is a valuable tool in opening areas of patient-therapist communication. Frequent themes in these pictures depicting past and current suicidal feelings include hopelessness, self-hatred, being harmful to others, isolation, and anger. Feelings associated with these themes, and expressed during therapy, are failure, guilt, and loss. Patterns and symbols recurring in suicidal ideation are noted. R. Tomasko.

991. Wadsworth, Allen P.; Wilson, Warner & Barker, Harry R. (Tuscaloosa VA Hosp, AL) **Reduction of state and trait anxiety by kind firmness attitude therapy.** *Psychological Reports*, 1975(Aug), Vol 37(1), 23-29.—Determined the impact upon state and trait anxiety of a treatment for depression based on "kind firmness" attitude therapy and compared the effectiveness of that program with the effectiveness of a more conventional form of therapy. The State-Trait Anxiety Inventory was administered to 16 university students and to 32 neurotic and 24 psychotic patients (age ranges = 18-23, 20-59 and 22-52 yrs, respectively) on 3 occasions. Neurotics treated on both programs declined significantly in state and trait anxiety. Psychotics treated by kind firmness therapy experienced a significant reduction in unpleasant, consciously perceived feelings of tension and anxiety (state) with no significant changes in anxiety proneness (trait). Psychotics treated on the conventional program, however, demonstrated an opposite pattern of response, experiencing a significant decrease in trait anxiety with no significant changes in state anxiety.—*Journal abstract*.

Group & Family Therapy

992. Anderson, Ellen K. A review of communication theory within the family framework. *Family Therapy*, 1972(Sum), Vol 1(1), 15-34.—Reviews literature that examined basic tenets of communication theory as applied to family therapy. Topics discussed include certain primary concepts of relationships, verbal and nonverbal communication, system analysis, and current issues in family communication research. Behavior is defined as communicative because it is impossible not to communicate. Focus is given to a variety of approaches (e.g., transactional, class theory). However, underlying all theories is the theoretical framework of the relationships of the parts to the whole. Communication theory as a means of family treatment does not cure all aspects of dysfunctional families. The current author maintains that communication analysis in family dynamics is helpful in diagnosis and treatment planning, as it elicits the underlying interactional patterns of family behavior. (37 ref)—D. P. Judd.

993. Boš, P. (Předmanželská a manželská poradna, Usti nad Labem, Czechoslovakia) [Family Rorschach: A method for detection of family dynamics.] (Czec) *Ceskoslovenská Psychiatrie*, 1974(Jun), Vol 70(3), 167-173.—Reprints a paper, presented at the 1973 National Psychotherapeutic Conference, which discusses the use of group Rorschach in exploring family dynamics. Pertinent European and American literature is reviewed, and experiences with a modified "Loveland Relation Rorschach Technique" in Czechoslovakia are reported. It is believed that the group Rorschach approach will increase the number of clinical tools for analyzing the communication and interaction system in the family, and will facilitate family diagnosis and therapy. (Russian & English summaries) (27 ref)—V. Fischman.

994. Coleman, Ronald E. & Miller, Alma G. (Acadia U, Wolfville, Canada) **The relationship between depression and marital maladjustment in a clinic population: A multitrait-multimethod study.** *Journal of Consulting & Clinical Psychology*, 1975(Oct), Vol 43(5), 647-651.—Took depression and marital maladjustment measures of all 154 couples attending a clinic. Average age for men was 38 yrs, for women 35 yrs; average length of marriage was 19 yrs. A significant correlation between depression and marital maladjustment was found for self-report data and was replicated by therapists' ratings. Women were significantly more depressed than men though similar in average ratings of marital adjustment. Women's depression ratings were minimally related to their own their husbands' marital ratings. Men's depression ratings were related to both their own and their wives' marital ratings. Convergent validity was demonstrated for the Locke and Wallace Marital-Adjustment Test and the Beck Depression Inventory. Clinical implications of findings concerning both depression and marital maladjustment are discussed.—*Journal abstract*.

995. Forlitz, Lorant. A schizophrenic patient in a large group treatment setting. *Journal of the National Association of Private Psychiatric Hospitals*, 1974(Sum), Vol 6(2), 27-34.—Presents the case history of a patient in

an open-ended group with a membership of 23-25.—*R. M. Cohen*

996. Gould, Edward; Garrigues, Charles S. & Scheikowitz, Karen. (Langley Porter Neuropsychiatric Inst. Clinical Research Ward San Francisco, CA) Interaction in hospitalized patient-led and staff-led psychotherapy groups. *American Journal of Psychotherapy*, 1975(Jul), Vol 29(3), 383-390.—Compared the reactions of psychotic inpatients to 2 types of group psychotherapy, one conducted by staff and the other led by patients with the staff observing. A frequency count of verbal productivity, carried out for 17 patients in both kinds of group, indicated that they talked significantly more in the patient-led group than in the staff-led one. Informal clinical observations were consistent with this finding. Moreover, the patient-led group seemed equally capable of handling potentially disruptive psychotic behavior. The importance of peer, self-help influences in groups for stimulating psychotic patients to take more responsibility for themselves and other patients is discussed.—*Journal summary.*

997. Haimowitz, Morris L. Training and therapy in large groups without charge. *Transactional Analysis Journal*, 1975(Jan), Vol 5(1), 36-37.—Describes transactional analysis therapy classes for 50 to 150 participants. Class format includes lectures, stroke breaks, exercises, and separating into small groups.

998. Hausner, M. (Krajský ústav narodního zdraví, SKNV, Sadržská, Czechoslovakia) [The fractioned weekend psychotherapy of chronic psychogenic, characterogenic, and sociogenic disturbances.] (Czech) *Ceskoslovenská Psychiatrie*, 1974(Jun), Vol 70(3), 195-199.—Outlines a form of therapy involving hospitalization and marathon group psychotherapy on weekends, carried out periodically (every 20-30 days) for several years. The method has favorable effects and the following advantages: It prevents the development of hospitalization neurosis, enables the patient to stay in his natural home environment, maintains his full working capacity, tests his motivation for therapy, increases the utilization of sick-beds, and fully utilizes the time of medical and nursing staff. It is calculated that for 40 patients this therapy has saved about 3,600 working and hospitalization days a year (about 1,340,000 korunas in value). (Russian & English summaries) (17 ref)—*V. Fischman.*

999. Justice, Rita & Justice, Blair. TA work with child abuse. *Transactional Analysis Journal*, 1975(Jan), Vol 5(1), 38-41.—Used a transactional analysis approach to therapy with 10 couples legally charged with child abuse. The therapy focused on breaking up the destructive symbiosis between the parents and between parent and child. The confrontation of discounts and correction of misinformation about parenting were stressed. Kiresuk's Goal Attainment Scale was used to evaluate the therapy's impact on the couples. 8 couples had their children returned to them on the therapist's recommendation.—*R. Tomasko.*

1000. Kaufman, Michael & Bluestone, Harvey. Patient-therapist: Are we free to choose therapy? *Groups: A Journal of Group Dynamics & Psychotherapy*, 1974-75, Vol 6(1), 1-13.—Studied the relationship between patient personality characteristics and various therapeutic approaches. 38 outpatients from a lower

socioeconomic area community mental health center were given the Rotter Internal-External Control Scale and a psychiatric diagnosis during 17 wks of group psychotherapy. Results indicate that locus of control is a useful rationale for patient selection. Group attendance was related to locus of control and therapeutic approach, with externals in directive groups having the best attendance (19 ref)—*R. Tomasko.*

1001. Kirchenbaum, Martin J. & Blinder, Martin G. Growth processes in married couples group therapy. *Family Therapy*, 1972(Sum), Vol 1(1), 85-104.—Discusses 7 aspects of the growth process that occur during the 18-24 mo life of a marital therapy group: (a) a sense of conjugal trust; (b) mutual acceptance and nurturance of intimacy; (c) individual autonomy and personal growth; (d) spontaneous ability to take risks; (e) perception of maleness and femaleness; (f) congruency and delineation in communication with others; and (g) beginnings of a new creative reality oriented survival structure.—*D. P. Judd.*

1002. Luthman, Shirley. The growth model in marital therapy. *Family Therapy*, 1972(Sum), Vol 1(1), 63-83.

Describes a growth model of marital therapy that is designed to (a) maximize the family's potential to fulfill its nurturing function and stimulate growth of its individual members, (b) assist individuals within the family unit to take responsibility for the total expression of their own desires and limitations necessary to the realization of their own growth potential, and (c) assist in the development of processes for handling change and experimentation without cutting into either the family's basic functions or the individual's growth. Examples are presented to illustrate pathological alternatives to the model, therapeutic use of the model, and ways in which the model aids in the emotional survival of the married couple.—*M. E. Pounsel.*

1003. Messmore, David W. (Michigan State U) An experimental study on the effects of 24-hour marathon encounter groups on self concept. *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 174.

1004. Peshkin, M. M. & Abramson, H. A. (Mt Sinai School of Medicine, City U New York) Psychosomatic group therapy with parents of children with intractable asthma: V. The Temple family: I. *Journal of Asthma Research*, 1974(Sep), Vol 12(1), 27-63.—Presents excerpts from author-conducted group therapy sessions with parents of children hospitalized with intractable asthma, to illustrate treatment approaches. Focus is placed on the experiences of parents of a latency-age male in a residential treatment center for asthmatic children, and the value of long-term removal of the asthmatic child from the home is stressed. The influence of parents' own past experiences and emotional development on the course of asthma in their children is discussed.—*E. S. Bishop.*

1005. Peshkin, M. M. & Abramson, H. A. Psychosomatic group therapy with parents of children with intractable asthma: VI. The Temple family: II. *Journal of Asthma Research*, 1974(Dec), Vol 12(2), 95-122.—Presents a transcript of group therapy sessions with parents of an asthmatic boy of latency age, hospitalized in a residential treatment center. Major aspects discussed are (a) the parents' problems in dealing

with the geographically distant institution; (b) the parents' religious conflicts and the problems these present for their marriage; (c) their problems in the daily management of a younger, nonasthmatic child; and (d) their desires for individual counseling or psychotherapy outside the therapy group.—*E. S. Bishop.*

1006. **Shaskan, Donald A.** (Oakland VA Mental Hygiene Clinic, CA) **Successful signs in borderlines.** *Groups: A Journal of Group Dynamics & Psychotherapy*, 1974-75, Vol 6(1), 15-19.—Discusses reasons for the differential prognosis of borderline patients using group therapy. 4 distinctions are noted which focus on differences between borderlines and more severe disorders: chaotic-impulsive, sexual deviant, narcissistic, and infantile. Nonspecific manifestations of ego weakness are considered appropriate for group therapy techniques.—*R. Tomasko.*

1007. **Sherman, Barbara.** **The adolescent in family therapy.** *Family Therapy*, 1972(Sum), Vol 1(1), 35-48.—Examines the adolescent's role in family functioning, focusing on the critical period when adolescent and parental issues become clouded. It is pointed out that frequently the adolescent is used as a scapegoat when family problems occur, when in reality all family members are connected in some way to the adolescent's presenting symptom. Treatment should involve the entire family. 3 interfamily levels are discussed: (a) relationships between spouses, (b) relationships between parents and children, and (c) relationships between children. Failure in one area of family functioning results in dysfunction in other family areas. Also, by treating the total family, attention is not placed on the adolescent to request help, since the whole family is involved. The therapist's role is to focus on interaction and communication. (20 ref)—*D. P. Judd.*

1008. **Solomon, Martin-L.** (Hôpital Ste-Justine, Montréal, Canada) [Transactional systems theory in family therapy: Its relevance to the definition of child psychiatry.] (Fren) *Information Psychiatrique*, 1974(Dec), Vol 50(10), 1025-1031.—Discusses the application to family therapy of Spiegel's transactional systems theory, and concludes that this has led to the recognition of many interacting elements and levels from the somatic to the ecological in family mental health. Such recognition has led in turn to a need for the redefinition of psychiatry and related disciplines and for the reevaluation of professional training programs.—*C. A. Sherrard.*

1009. **Symonds, Martin & Dawson, Evelyn S.** (New York, Medical School) **The co-therapist approach to group treatment with institutionalized early adolescent girls.** *Groups: A Journal of Group Dynamics & Psychotherapy*, 1974-75, Vol 6(1), 27-36.—Discusses the progress of group therapy sessions with 7-10-12 yr old girls designed to supplement milieu and individual treatment. The sessions strengthened the girls' abilities to face later adolescence with increased assertive and expressive abilities. Trust in their own worth and in the possibilities of warm relationships with adults were emphasized. The validity of traditional clinical psychiatric diagnoses as they apply to young, Black, or Puerto Rican urban poor are questioned.—*R. Tomasko.*

1010. **Vincent, John P.; Weiss, Robert L. & Birchler, Gary R.** (U Houston) **A behavioral analysis of problem**

solving in distressed and nondistressed married and stranger dyads. *Behavior Therapy*, 1975(Jul), Vol 6(4), 475-487.—Compared the problem solving behavior of distressed and nondistressed married couples and explored the state vs trait nature of such behavior through comparison of married and stranger dyads. Ss were 24-25-26 yr old couples who had been married 2-7 yrs. Behavioral codings obtained from spouse and stranger interactions around a standard conflict-eliciting task provided the measure of behavior. Distressed, relative to nondistressed married couples, emitted a significantly greater proportion of negative problem solving behavior and a significantly smaller proportion of positive problem solving behavior. As compared with stranger dyads, the behavior of nondistressed marital dyads tended to be more negative and more positive, whereas distressed marital dyads were more negative and less positive. Implications of findings for marital therapy and research are discussed. (37 ref)—*Journal abstract.*

1011. **Wolff, Roger A.** (Woodburn Ctr for Community Mental Health, Annandale, VA) **Therapeutic experiences through group art expression.** *American Journal of Art Therapy*, 1975(Apr), Vol 14(3), 91-98.—Discusses the use of "fear drawing" and similar art therapy techniques in several settings: a community mental health center training program, a day care center parent training program, and an adolescent outreach group. The ability of art techniques to move a group into an intimate mode of personal interaction without arousing anxiety and resistance is noted, and the routine of discussing the drawings after they have been made is described. Feelings illustrated in the drawings include sadness, joy, sexuality, anger, frustration, and separation.—*R. Tomasko.*

1012. **Ziegler, Joseph S.** (U Pittsburgh) **A comparison of the effect of two forms of group psychotherapy on the treatment of marital discord.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 143-144.

Encounter Group & Sensitivity & Human Relations Training

1013. **Brenner, Ruth S.** (Purdue U) **The effects of systematic feedback to leaders on outcomes in human relations training groups.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 129.

1014. **Frazier, James R. & Carver, Jeanine E.** (North Carolina Memorial Hosp, Child Development Inst, Chapel Hill) **Some comments on the problem of defining assertive training.** *Comprehensive Psychiatry*, 1975(Jul-Aug), Vol 16(4), 369-373.—Examines selected literature illustrating the variety of definitions associated with the term "assertive training." Both clinical and experimental examples are used to discuss the difficulty of defining this procedure.

1015. **Gebhart, James F. & Criswell, Grover E.** (Southwest Community Mental Health Ctr, Adult Services, Columbus, OH) **The 24-hour marathon.** *Journal of Pastoral Care*, 1974(Dec), Vol 28(4), 221-240.—Discusses personal experiences and conclusions after conducting 30 24-hr marathons involving over 400 persons. The parameter of time-awareness is considered, as well as its phases within the 24-hr period, fatigue.

"second-wind," and the need for closure and preparation for re-entry into the world outside. The role of leaders and their modeling function, demands and qualities, and the importance of coleadership are also considered. Structures of the group in process, introductory exercises, contract, and process principles are described. Issues of management, selection and screening criteria, setting, and follow-up are examined. The healing possibilities and hazards of the marathon, including unresolved leader countertransferences, are also considered.—B. Smith.

1016. Haight, Donald A. (U Florida) **Video tape feedback in group encounter with community college students.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 135-136.

1017. Kincald, Marylou B. (Arizona State U) **Effects of a group consciousness-raising program on the attitudes of adult women.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1082-1083.

1018. Weinstein, Malcolm S. & Hanson, Robert G. (York U, Downsview, Canada) **Personality trait correlates of verbal interaction levels in an encounter group context.** *Canadian Journal of Behavioural Science*, 1975(Jul), Vol 7(3), 192-200.—Examined the relationships between personality traits individuals attributed to themselves and their subsequent levels of verbal interaction in ongoing encounter groups. Ss were 31 undergraduates. Based on R. F. Bales's (1970) work on the conceptualization of personality as an interpersonal process, it was predicted that Ss with high levels of verbal interaction would score significantly higher than less active Ss on Adjective Check List (ACL) measures of Self-Confidence, Dominance, and Exhibition. This hypothesis was confirmed. As predicted, Ss with low levels of interaction scored significantly higher on the ACL Abasement scale. Results are discussed in relation to their implications for the area of implicit theories of personality. (French summary) (24 ref)—*Journal abstract*.

1019. Wildblood, Robert W. (Purdue U) **The relationship between structured encounter group experience and reported self-concept in female college students.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 143.

Behavior Therapy & Behavior Modification

1020. Arnold, J. E.; Levine, A. G. & Patterson, G. R. (U California, Santa Barbara) **Changes in sibling behavior following family intervention.** *Journal of Consulting & Clinical Psychology*, 1975(Oct), Vol 43(5), 683-688. Reports changes in the behavior of the 55 siblings of 27 treated predeinquents. Siblings were 3 yrs old or older. The parents of the referred predeinquents had been trained in social learning techniques of child management. Prior analyses of home observation data showed significantly reduced rates of deviant behaviors for the identified problem children. These reductions were maintained over a 12-mo follow-up. The child management procedures taught to the parents were presumably applied to siblings as well as to the identified problem child. Analyses were conducted for the data from the siblings. The baseline data show no significant differences between siblings and identified problem

children. At termination of treatment, there were significant reductions in rates of deviant behavior for the siblings. Follow-up results show the effects were maintained over 6 mo. Some clinical implications of home intervention programs for socially aggressive boys and their siblings are discussed (18 ref) *Journal abstract*.

1021. Bennett, Linda & Guilford, Arthur M. (U Michigan, Speech Clinic) **A behavioral approach to aphasia therapy: A case study.** *Journal of Biological Psychology*, 1974, Vol 16(2), 23-25.—Describes a behavior modification program for a 21-yr-old aphasic male. The 2 main behavioral objectives were to reduce the inappropriate disruptive behaviors within the speech therapy sessions and to increase the success level associated with reading tasks thereby improving the client's sight vocabulary and overall reading ability. Baseline data demonstrated significant improvement following 14 sessions over 7 wks of the program. Both behavioral objectives were achieved with carryover into situations outside of therapy. Results indicate the need for more research into the possible uses of combining behavior modification theory and techniques to speech and language therapy.—*Journal abstract*.

1022. Couch, Robert H. (Auburn U) **Rehabilitation facility attendance of the disadvantaged: A comparison of tangible and intangible reinforcers.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 131.

1023. Curran, James P. & Gilbert, Francis S. (Purdue U) **A test of the relative effectiveness of a systematic desensitization program and an interpersonal skills training program with date anxious subjects.** *Behavior Therapy*, 1975(Jul), Vol 6(4), 510-521. Compared the effectiveness of 2 behavioral techniques (systematic desensitization and a skills training program) in reducing dating anxiety and in improving interpersonal skills. 35 college students were randomly assigned to the 2 treatment groups or a minimal contact control group. Self-report and behavioral indicators of anxiety and skill were collected at a posttreatment session and at a 6-mo follow-up session. The control group did not demonstrate any improvement on the dependent measures. Both treatment groups demonstrated significant decreases on the anxiety indicators over testing occasions and did not differ from each other significantly. Only the skills training group demonstrated significant improvement on the interpersonal skills indicator. (22 ref) —*Journal abstract*.

1024. Diament, Charles & Wilson, G. Terence. (Rutgers State U, Graduate School of Applied & Professional Psychology) **An experimental investigation of the effects of covert sensitization in an analogue eating situation.** *Behavior Therapy*, 1975(Jul), Vol 6(4), 499-509.—Compared covert sensitization (CS) to an attention-placebo group and a no treatment control group in a controlled outcome study with 4 male and 32 female obese college students. In addition to weight loss, dependent measures included quantity of food consumed in an analogue eating situation and a salivary response measure of the palatability of the target food. Results showed no differential effect among the 3 treatment groups on any of these 3 objective behavioral measures. However, both CS and attention-placebo groups reported significantly greater treatment-produced

negative subjective reactions to the taste and odor of the target food than the no treatment group. Findings seriously call into question the purported efficacy of CS as an aversive conditioning technique. (21 ref)—*Journal abstract*.

1025. Doty, David W. (State U New York, Albany) **Role playing and incentives in the modification of the social interaction of chronic psychiatric patients.** *Journal of Consulting & Clinical Psychology*, 1975(Oct), Vol 43(5), 676-682.—Studied the relative and combined effectiveness of role playing and monetary incentives to increase the social interaction and responsiveness of chronic male psychiatric patients. 56 Veterans Administration hospital noninteractive patients (mean age, 48 yrs) were assigned either to 1 of 3 treatment conditions (role playing only, incentive only, or combination) or 2 control conditions (nonspecific or no-treatment control) for a total of 4 sessions. Dependent measures were extracted both from observations of the Ss' ward behavior (percent of time spent alone) over a 4-wk period and from observations of the Ss' participation in structured small group discussions at pre- and posttreatment. All S groups were equated on pretreatment ward behavior measures, age, length of hospitalization, and drug status. Trend analyses of ward data and post hoc *t* tests with the discussion data consistently indicated significant positive changes at posttreatment for only those groups receiving monetary incentives. Results are discussed with regard to their potential specificity to short-term treatment, their suggestions for institutional treatment practices, and the fact that they point up the utility of direct, objective assessment of social behavior in institutional settings. (15 ref)—*Journal abstract*.

1026. Duker, P. (U Nijmegen, Inst for Special Psychology, Netherlands) **Behaviour control of self-biting in a Lesch-Nyhan patient.** *Journal of Mental Deficiency Research*, 1975(Mar), Vol 19(1), 11-19.—Compulsive self-biting of a mentally deficient 8-yr-old male was treated successfully with behavior therapy. Behavior analysis preceded the treatment to confirm the operant hypothesis of his nonadaptive responses. The treatment failed to achieve stimulus control over the patients' head-banging behavior. Results are discussed in terms of a synthesis between a somatic and behavioral approach to the Lesch-Nyhan self-mutilative behavior. —*Journal summary*.

1027. Fo, Walter S. & O'Donnell, Clifford R. (U Hawaii) **The buddy system: Effect of community intervention on delinquent offenses.** *Behavior Therapy*, 1975(Jul), Vol 6(4), 522-524. Compared the delinquent offense records of 264 multi-ethnic male and female 10-17 yr olds participating in a community-based behavioral intervention program with those of 178 youngsters in a no-treatment control group. For youngsters who had committed major offenses in the previous yr, program participation significantly reduced the number of such youths committing major offenses during the project yr. For youngsters with no record of major offenses in the preceding yr, reliably more experimental youths committed major offenses during the project yr than controls. Thus, those individuals for whom the program was effective were identified and

separated from those for whom it might be counter-effective.—*Journal abstract*.

1028. Fontana, Marie. (Columbia U) **Experimental modification of disfluent speech behavior in children.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 634.

1029. Fremouw, William J. & Harmatz, Morton G. (West Virginia U) **A helper model for behavioral treatment of speech anxiety.** *Journal of Consulting & Clinical Psychology*, 1975(Oct), Vol 43(5), 652-660.—Assessed the effect of speech-anxious Ss acting as behavior therapists for other speech-anxious Ss. 41 undergraduates were divided into helper, helpee, latent helper, and waiting list control groups. Helpers learned behavioral techniques for anxiety reduction in a training seminar and then taught the techniques to the helpee group. Latent helpers only participated in the training seminar and did not train other Ss until after the posttreatment assessment. Both the helpers and helpees significantly reduced speech anxiety on each behavioral and self-report measure relative to the waiting list control group at posttreatment, and the improvement was maintained at a 3-mo follow-up. At posttreatment, the latent helpers improved on all self-report measures and one of the behavioral measures. The helpers showed more absolute improvement on each measure than the helpees or latent helpers; however, none of these differences was significant. The use of people with behavioral problems as therapists for others with similar problems is discussed from a therapeutic and an economic perspective. (27 ref)—*Journal abstract*.

1030. Glueck, Bernard C. & Stroebel, Charles F. (Inst of Living, Hartford, CT) **Biofeedback and meditation in the treatment of psychiatric illnesses.** *Comprehensive Psychiatry*, 1975(Jul-Aug), Vol 16(4), 303-321.—Describes 3 methods used by individuals in Western cultures to cope with the demands of those societies. Results of several studies are presented which show that the most appropriate technique to use with psychiatric patients, in an attempt to produce an increase in the generalized relaxation response, appears to be a mantratype passive meditation, Transcendental Meditation. This technique was learned rapidly by psychiatric patients and appeared to hold their interest over a considerable period of time, in contrast to autogenic training and alpha EEG biofeedback training. It also appeared to add a significant positive therapeutic dimension to the overall hospital treatment program. In sharp contrast to the difficulties experienced by patients in utilizing alpha EEG biofeedback for generalized relaxation, the successful application of specific biofeedback conditioning utilizing thermal and muscle tension feedback signals is described for the treatment of patients with vascular headaches, muscle contraction headaches, and Raynaud's disease. It is concluded that the various types of biofeedback and general relaxation techniques must be carefully tailored to the needs of the individual patient. (37 ref)—*M. E. Pounsel*.

1031. Goldman, Herbert et al. (St Louis VA Hosp. Neuropsychology Lab, MO) **Relationship between essential hypertension and cognitive functioning: Effects of biofeedback.** *Psychophysiology*, 1975(Sept), Vol 12(5), 569-573.—7 35-68 yr old male essential hyperten-

sives underwent 9 weekly 2-hr biofeedback training sessions in an attempt to produce decreases in blood pressure. Feedback, contingent upon heart beat-by-heart beat decreases in systolic pressure, was provided by an automated blood pressure monitoring system. The Ss were administered the Category Test (a subtest of the Halstead Impairment Index) before and after biofeedback training. As controls, 4 male 38-63 yr old hypertensives underwent 3 weekly sessions in which blood pressure was monitored without feedback. Prior to training, a significant positive correlation was obtained between systolic blood pressure and number of errors made on the Category Test. Biofeedback training produced significant decreases in systolic pressure within sessions and in diastolic pressure between sessions. In the control Ss, no significant changes in pressure were observed. For both systolic and diastolic pressures, significant correlations were obtained between magnitude of decrease during biofeedback training and improvement in Category Test scores subsequent to training.—*Journal abstract.*

1032. Griffin, James C.; Patterson, Earl T.; Locke, Bill J. & Landers, William F. (Western Carolina Ctr, Morgantown, NC) **Toward automated physical therapy with the non-ambulatory profoundly retarded via operant conditioning.** *Behavioral Engineering*, 1975(Spr), Vol 2(3), 72-75.—Presents data which indicate the feasibility of automated physical therapy for the crib-bound profoundly retarded via operant conditioning techniques. The eliciting properties of tactile stimulation were determined with 3 children (3½ and 5 yrs old) involved in daily 30-min training sessions for 40 days. An inexpensive manipulandum, which has been field tested and which reliably records responds from a crib-bound S, was used. Each S's idiosyncratic rate of responding dictated the most effective procedure to increase his rate of gross physical movement. Implications are stated concerning the possibilities of automated physical therapy.—*Journal abstract.*

1033. Hastings, James E. & Walker, Michele J. (Bowling Green State U) **The effects of level of fear and rate of approach on cardiac rate and avoidance of a phobic stimulus.** *Behavior Therapy*, 1975(Jul), Vol 6(4), 445-452.—Selected 32 female undergraduates on the basis of unusually high or low scores on a questionnaire sampling fear of snakes. Ss participated in a 10-step, semi-automated snake approach task while cardiac rate was measured. Orthogonal to level of fear, 2 different rates of approach were used: 1 in which each approach step followed immediately after the preceding one, and 1 in which the approach steps were separated by 30 sec. Low-fear Ss completed the approach task without stopping, showing low and stable cardiac rates throughout. High-fear Ss stopped the approach task significantly earlier, and those in the rapid approach condition showed significantly higher heart rates. Contrary to prediction, high-fear Ss in the slow approach condition terminated the task significantly earlier than their fast approach counterparts but showed lower heart rates.—*Journal abstract.*

1034. Inutsuka, I. **[A token-reinforcement program for chronic schizophrenic.]** (Jpn) *Kyushu Neuro-Psychiatr*, 1978, Vol 21(1), 43-51. Reports the results of

operant conditioning with a token-economy program applied to 10 extremely regressed and withdrawn chronic schizophrenic female patients, ages 17-52 yrs. Poker chips were given immediately by the nurses when Ss showed an increase in social activities and in interpersonal relationships. Patients could earn an unlimited number of chips. The conditioning was continued for 19 mo. 3 Ss showed remarkable behavior improvement and were transferred to another ward for rehabilitation training. 3 other Ss improved slightly, and 2 of these 3 were transferred to another ward for different psychiatric treatment. 2 others were dropped from the program because they did not respond to the conditioning, and the remaining 2 failed to improve in the program. Results suggest that social conditions and the attractiveness of the token used are the major factors determining the degree of effectiveness of such a program, and that the effects of a token-economy program are not sufficient for the treatment of chronic schizophrenics. (English summary) (26 ref)—S. Ashida.

1035. Kazdin, Alan E. (Pennsylvania State U) **Covert modeling, imagery assessment, and assertive behavior.** *Journal of Consulting & Clinical Psychology*, 1975(Oct), Vol 43(5), 716-724.—Conducted an investigation to (a) examine the effect of 2 variables in developing assertive behavior using covert modeling and (b) develop a technique to assess ongoing imagery during treatment. Ss were 54 18-61 yr olds. In a 2 × 2 design, the number of models imagined (imagining several models vs imagining a single model perform assertively) and model reinforcement (imagining favorable consequences following model behavior vs imagining no consequences) were combined. A nonassertive-model control group that imagined assertion-relevant scenes was included in the design. Results indicate that imagining multiple models or model reinforcement enhanced behavior change across self-report inventories and a behavioral role-playing test. Treatment effects transferred to novel role-playing situations and were maintained at a 4-mo follow-up assessment. Assessment of imagery during the session corroborated the adherence of Ss to the imagery conditions to which they were assigned. However, Ss systematically introduced elaborations into the scenes. Data suggest the importance of assessing imagery in covert conditioning therapy studies. (17 ref)—*Journal abstract.*

1036. Killory, J. F. (Private Practice, Milwaukee, WI) **Corporal punishment as an alternative to electroshock in aversive psychotherapeutic procedures with children and adolescents.** *Behavioral Engineering*, 1975(Spr), Vol 2(3), 70-71.—Argues that corporal punishment may well present many of the advantages without some of the disadvantages of electroshock as a noxious stimulus. Its use may be especially appropriate for the in vivo treatment of the behavioral excesses of children and adolescents. Problems involved in electroshock treatment and some of the objections to corporal punishment are discussed. (27 ref)—*Journal abstract.*

1037. Kornhaber, Robert C. & Schroeder, Harold E. (William Paterson Coll) **Importance of model similarity on extinction of avoidance behavior in children.** *Journal of Consulting & Clinical Psychology*, 1975(Oct), Vol 43(5), 601-607. Studied the effectiveness of therapeutic mod-

eling by using models similar or dissimilar to observers in a class of behavior being modified (fear) and a characteristic (age) seemingly irrelevant to the modeled response. Ss were 50 2nd and 3rd graders. 40 Ss who showed behavioral fear of snakes viewed models of 1 of 4 types: fearless child, fearful child, fearless adult, fearful adult. In addition, 10 Ss saw no model in a control condition. Pre- and postmeasures of fear were taken on behavioral and attitude dimensions. With respect to overt avoidance, model similarity on the response dimension (level of fear) was an unimportant variable, but model similarity on the age dimension was important. With respect to attitudes, more similar models produced the greatest change regardless of the dimension on which similarity occurred. An integration of these findings with other research is presented. (23 ref)—*Journal abstract.*

1038. Lando, Harry A. & Davison, Gerald C. (Iowa State U) **Cognitive dissonance as a modifier of chronic smoking behavior: A serendipitous finding.** *Journal of Consulting & Clinical Psychology*, 1975(Oct), Vol 43(5), 750.—Results of a study (undertaken as a methodological analog to J. H. Resnick's 1968 investigation) with adult smokers, in which rate of puffing rather than number of cigarettes smoked was manipulated in a controlled setting, are contrary to those predicted: self-paced control Ss fared better than operantly paced experimental Ss and rated cigarettes less favorably at the end of the study. Results are explained in terms of cognitive dissonance theory.

1039. Lipinski, David P.; Black, John L.; Nelson, Rosemary O. & Ciminero, Anthony R. (U North Carolina, Greensboro) **Influence of motivational variables on the reactivity and reliability of self-recording.** *Journal of Consulting & Clinical Psychology*, 1975(Oct), Vol 43(5), 637-646.—Conducted 3 experiments to investigate variables related to the assessment and therapeutic functions of self-recording. In Exp I 20 college students in a classroom situation were differentially reinforced (successfully) either for increments in agreement between their self-recorded frequency of face touching and the frequencies reported by trained observers or for decrements in face touching. In Exp II 21 college students in a classroom situation received varying levels of verbal feedback for the reliability of their self-recorded face touching, but these varying levels did not differentially affect reliability. In Exp III the 16 college students who were motivated to stop smoking reported fewer cigarettes smoked during self-monitoring than the 20 nonmotivated students. Results are discussed in the context of variables that enhance the assessment and therapeutic functions of self-monitoring. (25 ref)—*Journal abstract.*

1040. Lira, Frank T.; Nay, W. Robert; McCullough, James P. & Etkin, Michael W. (U Illinois, Champaign) **Relative effects of modeling and role playing in the treatment of avoidance behavior.** *Journal of Consulting & Clinical Psychology*, 1975(Oct), Vol 43(5), 608-618. Investigated the efficacy of symbolic modeling and role-playing therapy in the reduction of avoidance behaviors in 48 undergraduates. Carefully selected snake-phobic Ss were administered either self-regulated symbolic modeling, self-regulated role-playing instruc-

tions, or exposure to a snake-only videotape, or they received no treatment. After brief treatment periods role-playing Ss demonstrated significantly greater reductions in avoidance behavior than Ss in the modeling and control conditions. Subjective fear ratings reported before and during task performance on a behavioral approach test were significantly lower for role-playing Ss than for modeling Ss following treatment. Posttreatment attitude measures showed that role-playing Ss held significantly more positive attitudes toward harmless snakes than Ss who had undergone the symbolic modeling procedure. A 2-mo follow-up suggested that treatment gains had been maintained for both behavioral and subjective reports. Findings provide compelling evidence that a self-administered role-playing procedure can effect rapid and enduring changes within a variety of dependent variable measures associated with avoidance. Findings are explained in terms of the behavioral modality (covert-overt) toward which a treatment is directed. (18 ref)—*Journal abstract.*

1041. Logan, Daniel J. (U Texas, Health Science Ctr, Dallas) **Extending breath-holding breaking point (BHBP) in emphysema patients by operant conditioning.** *Behavioral Engineering*, 1975(Spring), Vol 2(3), 76-79.—Determined the effects of operant conditioning on the extension of BHBP in 2 chronic emphysema patients. Operant trials represented 5-15 sec increments beyond maximum baseline effort. Criterion response was to breath-hold until a small light went off. Money was used as a backup reinforcer. Operant trials were significantly more effective than control trials in extending breath-holding beyond maximum baseline levels. Ss were able to tolerate much higher CO₂ levels during operant trials than either baseline or control periods. Implications of these results are that disabled, nonworking emphysema patients may be taught to perform tasks which they previously reported were too difficult or painful to complete.—*Journal abstract.*

1042. Lowe, John C. & Mikulas, William L. (U West Florida) **Use of written material in learning self-control of premature ejaculation.** *Psychological Reports*, 1975(Aug), Vol 37(1), 295-298.—Studied the usefulness of an 80-page written treatment program for control of premature ejaculation in 10 males. The program included the problem and proposed treatment goals, instruction in sensate focus, and the use of helpful body positions and techniques. Ss completed a questionnaire about the frequency of premature ejaculations before and after the 3-wk program. Significant increases in ejaculatory control times were found in pre- and posttreatment questionnaire results. The usefulness of this type of approach compared to lengthy psychotherapy or sessions with sex therapists is discussed.—*L. Gorsev.*

1043. McConnell, James V. (U Michigan, Mental Health Research Inst) **Behavioral therapy: A potential new ground of malpractice liability.** *Journal of Biological Psychology*, 1974, Vol 16(2), 4-10.—Discusses the author's experiences in teaching and studying the principles of behavior modification and in administering a private behavioral clinic. Legal implications of behavior modification and the question of where the doctor's responsibility for his patient's success or failure ends is examined. If

is emphasized that one of the most important discoveries to be derived from behavioral psychology, a finding that has implications for all professions and individuals, is that everything we say and do has some kind of effect on the people around us; this idea lies in opposition to the views of man as a free agent. The advantages of behavioral approaches to psychological problems are also considered in relation to biological and Freudian viewpoints.—*L. Gorsey.*

1044. McGee, James P. (Sheppard & Enoch Pratt Hosp, Towson, MD) **Broad spectrum behavior therapy with a chronic schizophrenic.** *Journal of the National Association of Private Psychiatric Hospitals*, 1974(Sum), Vol 6(2), 5-18.—Discusses the treatment of a chronic schizophrenic using role rehearsal, social skill training, relaxation training, cognitive control, and rational emotive psychotherapy.—*R. M. Cohen.*

1045. Murray, D. C. (VA Mental Hygiene Clinic, Syracuse NY) **Treatment of overweight: I. Relationship between initial weight and weight change during behavior therapy of overweight individuals: Analysis of data from previous studies.** *Psychological Reports*, 1975(Aug), Vol 37(1), 243-248.—Used data from studies of the use of behavior therapy in the treatment of overweight to compute correlations between initial weight and weight change. Findings suggest that there is a tendency for those with the highest initial weight to lose the most weight. The relationship appears higher when both men and women are included than if data are only from women and when treatment is longer. Results imply a similar relationship between initial disturbance and outcome of treatment in psychotherapy generally. (24 ref)—*Journal abstract.*

1046. Murray, D. C.; Davidoff, Linda & Harrington, L. Garth. (VA Mental Hygiene Clinic, Syracuse, NY) **In vivo self-control training.** *Psychological Reports*, 1975(Aug), Vol 37(1), 249-258.—2 groups of 9 overweight women each received 12 sessions of self-control training in the presence of fattening foods. In 1 group self-control was followed by eating a low-calorie food. Results were compared with 2 control groups. Weights for 12 wks pretreatment and 12 and 24 wks posttreatment were collected. The group receiving self-control training and a substitute low-calorie food had a statistically significant average weight loss of 8.89 lbs during treatment. The other groups had only very small losses. Differences between groups preclude firm identification of the reason for this. By 24 wks posttreatment, an average 7.33 lbs had been regained. No significant correlations were found between weight losses and personality variables (Rotter's Internal External Scale and Marlowe-Crowne Social Desirability Scale). Comparable studies indicating success with group behavior therapy have either no or inadequate follow-up, or other shortcomings. It is concluded that there is no reliable evidence to date that group behavior therapy will result in permanent weight loss. (25 ref) *Journal abstract.*

1047. Muttar, A. K.; Peck, D.; Whitlow, D. & Fraser, W. (Lynebank, Hosp, Dunfermline, Scotland) **Reversal of a severe case of self-mutilation.** *Journal of Mental Deficiency Research*, 1975(Mar), Vol 19(1), 3-9.—Treated a particularly severe case of self-injurious behavior in a 9-yr-old female by response contingent shock, combined

with rewards. The shock, however, unavoidably provided the major component in the earlier stages. Precautions taken and a description of the procedure and the extreme persistence required are discussed. No adverse side effects, such as disruption of social relationships, were reported. The desirable side effects, such as an increase in eating and exploratory behavior and pleasure vocalizations, occurred. Extinction of self-injurious behavior was maintained over a 20-mo follow-up period.—*Journal summary.*

1048. Nakamura, Masazumi; Okaue, Miyako & Nakamura, Masuo. (Aeromedical Lab, JASDF, Tokyo, Japan) **[The experimental analysis of operant conditioning and some applications.]** (Japan) *Reports of Aeromedical Laboratory*, 1975(Mar), Vol 15(4), 169-178.—Explains basic terms of operant conditioning, behavior modification, and biofeedback. Applications in space, marine, and aviation research are suggested. (English summary) (20 ref)

1049. Parish, Thomas S. (U Illinois, Urbana-Champaign) **Changing anti-Negro attitudes in Caucasian children through mediated stimulus generalization.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 886.

1050. Pope, John W. & Mount, George R. (Beverly Hills Hosp, Dallas, TX) **The control of cigarette smoking through the application of a portable electronic device designed to dispense an aversive stimulus in relation to subject's smoking frequency.** *Behavioral Engineering*, 1975(Win), Vol 2(2), 52-56.—Investigated the effectiveness of faradic shock for extinction of smoking in 21 male and 22 female college students 19-26 yrs old. A portable electronic apparatus was constructed which emitted an auditory signal, followed by shock delivered to S's preferred smoking arm, when smoking behavior was initiated by the S. Construction and safeguards of the apparatus are described. 39 of the Ss completed the study, and 35 could be followed up a year later. 27 were still not smoking, 6 smoked minimally, and 1 had returned to baseline frequency.—*Journal abstract.*

1051. Ray, Edward T. & Shelton, James T. (Camarillo State Hosp, CA) **A brief note on administrative management of aversive conditioning at Porterville State Hospital.** *Behavioral Engineering*, 1975(Spr), Vol 2(3), 68-69.—Describes administrative policy and procedures regarding the use of aversive stimuli as a treatment with the mentally retarded, including determination of conditions under which it may be used, methods of obtaining approval for treatment, and procedures for administering the stimulus.

1052. Romanczyk, Raymond G. & Goren, Elizabeth R. (State U New York, Binghamton) **Severe self-injurious behavior: The problem of clinical control.** *Journal of Consulting & Clinical Psychology*, 1975(Oct), Vol 43(5), 730-739.—Describes the long-term treatment program and follow-up of a case of chronic, severe, multiple self-injurious behavior. The intensity, frequency, and multiplicity of self-injurious behavior in a boy 1st seen at age 6½ yrs is unparalleled in the literature. Treatment spanned 10 mo and more than 1,000 therapy hrs. Contingent electric shock and differential reinforcement of other behavior were the primary techniques utilized. The specifics of the punishment and reinforcement

contingencies were modified throughout the program as a function of the behavior, thereby allowing for evaluation of the various components of the treatment procedures. Although initial results were only partially successful, total suppression was eventually achieved in the laboratory setting. The procedures described for extending this control to the natural environment proved only moderately successful. The technical, ethical, and theoretical issues concerning the treatment of severe self-injurious behavior are discussed. It is suggested that the extrapolation of laboratory evidence to the natural setting is premature in the case of severe self-injurious behavior. Suggested criteria for the assessment of successful clinical treatment of self-injurious behavior are offered. (24 ref)—*Journal abstract*.

1053. Rouse, Larry; Peterson, John & Shapiro, Gary. (California State U. Biophysics Lab, Fresno) EEG alpha entrainment reaction within the biofeedback setting and some possible effects on epilepsy. *Physiological Psychology*, 1975(Jun), Vol 3(2), 113-122. Compared parameters of alpha in synchronization with alpha-feedback to those of alpha which was independent of such feedback. 12 male and 12 female human volunteers were given a 30-min EEG alpha biofeedback training session within an active placebo setting. 10 dependent measures computed from serial 3-min period distributions showed no difference between contingent and yoke conditions or between 9-11 and 8-13 Hz feedback. Most Ss showed entrainment of the alpha rhythm toward a stable frequency over trials. 5 additional Ss given 5 daily 30-min sessions of 9.5-10.5 Hz feedback showed a repetition of this same effect. Over a period of 4 mo, a grand mal epileptic gradually entrained a bimodal period distribution toward a unimodal one centered at 10 Hz. This effect was paralleled by a significant drop in seizure rate. Results are interpreted in terms of electrophysiological homeostasis. (99 ref)—*Journal abstract*.

1054. Sewell, William R. (Memphis State U) A brief note on a simpler method of oral pacifier withdrawal. *Behavioral Engineering*, 1975(Spr), Vol 2(3), 75.—Describes a method of progressively shortening a pacifier over time until it is reduced to a handle, in order to preclude emotional outbursts resulting from the abrupt removal of the positive stimulus.

1055. Shapiro, David & Surwit, Richard S. (U California, Los Angeles) Operant conditioning: A new theoretical approach in psychosomatic medicine. *International Journal of Psychiatry in Medicine*, 1974(Fal), Vol 5(4), 377-387. —Behavioral approaches to psychosomatic medicine, such as biofeedback, are reviewed and are contrasted with the psychodynamic approach. (32 ref)

1056. Stuart, Richard B. (U British Columbia, Vancouver, Canada) Challenges for behavior therapy: 1975. *Canadian Psychological Review*, 1975(Jul), Vol 16(3), 164-172.—Notes that due to a combination of forces including a growing public concern with the impact of science upon daily life and the publication of abuses of human subjects' rights by scientists, there has been an intensified demand placed upon behavior therapists in particular to develop new programs adequate to the task of protecting the rights of human subjects. Following a definition of behavior therapy, this paper presents an outline of one proposal for these

ethical guidelines and suggests additional procedural principles which might guide the practice of behavior therapy. Suggestions are made for the development of behaviorally oriented approaches to macrosocial problems.—*Journal abstract*.

1057. Thorne, D. Eugene. (Brigham Young U) Instrumented behavior modification of bedwetting. *Behavioral Engineering*, 1975(Win), Vol 2(2), 47-51.—Assigned 15 male and 5 female enuretic Ss 3-22 yrs old to treatment or control groups of 10 Ss each. 30-day enuresis ratings for the 2 groups were compared. Treatment of the experimental group consisted of 4-6 hrs of professional consultation regarding (a) use of an enuresis counterconditioning device and (b) application of a complementary operant contingency program. Difference of results for the 2 groups was highly significant ($p < .001$) and is interpreted as demonstrating the effectiveness of the instrumented procedure.—*Journal abstract*.

1058. Wein, Kenneth S.; Nelson, Rosemary O. & Odom, J. Vernon. (U North Carolina, Greensboro) The relative contributions of reattribution and verbal extinction to the effectiveness of cognitive restructuring. *Behavior Therapy*, 1975(Jul), Vol 6(4), 459-474.—The 2 purposes of this study were (a) to analyze differentially the verbal extinction and reattribution elements of a cognitive therapy, Cognitive Restructuring (CR); and (b) to analyze these differential effects on measures of fear behavior from 3 response modes (verbal, motoric, and somatic). In addition to a no-treatment control, 4 forms of group treatment were used with snake phobic female college students ($n = 8/\text{group}$): Cr; Verbal Extinction (VE); Systematic Desensitization (SD) as a standard technique control; and an Attention-Placebo control. Although verbal extinction had a facilitative effect in reducing subjective fear, the element of reattribution contributed significantly beyond verbal extinction to the efficacy of CR in reducing behavioral avoidance and, to a lesser extent, subjective fear. CR and SD produced equal and marked improvement in reducing behavioral avoidance, but CR and VE were the only treatments to have a therapeutic effect on subjective fear. None of the treatment procedures produced a significant improvement on the somatic measure. (37 ref)—*Journal abstract*.

1059. Youell, Katherine J. & McCullough, James P. (Virginia Commonwealth U, Psychological Services Ctr) Behavioral treatment of mucous colitis. *Journal of Consulting & Clinical Psychology*, 1975(Oct), Vol 43(5), 740-745. Reports the case history of a 22-yr-old female student who suffered approximately 1 colitis attack/day who was apparently successfully treated by a procedure in which the therapist labeled antecedent stress events that appeared to be precipitating the attacks. The client was then taught a behavioral coping strategy to counter the stress events.

Drug Therapy

1060. Angrist, Burton M.; Sathananthan, Gregory; Thompson, Hyacinth & Gershon, Samuel. (New York U Medical Ctr, Neuropsychopharmacology Research Unit) A clinical trial of a structurally unique neuroleptic (SU-23397). *Current Therapeutic Research*, 1975(Aug), Vol 18(2), 359-363. Conducted an open dose-tolerance and

early efficacy study of SU-23397 in 1 manic and 10 schizophrenic inpatients. Ss showed a good tolerance to dosages up to 300 mg/day. The drug proved both to be therapeutically efficacious (as determined by a battery of psychiatrists' and nurses' tests), and to cause extrapyramidal side effects, which were controlled by antiparkinson drugs.—*Journal abstract.*

1061. Audisio, Michel; Membrey, Jean-Michel & Pizarz, Alain. [Investigation of the therapeutic effectiveness of a powerful tranquilizer lorazepam.] (Fren) *Information Psychiatrique*, 1974(Dec), Vol 50(10), 1045-1052.—Studied the therapeutic efficacy, other than its main effect of tranquilization, of lorazepam. 29 hospitalized females and 33 ambulatory males with various mental disorders were observed for 14 mo. The representation of disorders within age groups was approximately equal across, though not within, sexes. Dosage, length of treatment, and simultaneous treatment with other drugs varied between individuals. From evaluations of therapy on a 5-point scale "no improvement" to "very good improvement" it is concluded that, for mean values of 10 mg daily oral dosage over 3 mo, lorazepam is indicated for the following disorders: nonpsychotic reactive depressions; depressions with neuroses and psychopathologies; subacute anxiety states in some psychotics and in feeble-minded, epileptic, and puerperal patients; and personality disorders, particularly with alcoholism and dementia.—C. A. Sherrard.

1062. Ban, Thomas A. (McGill U, Div of Psychopharmacology, Montreal, Canada) **Drug interactions with psychoactive drugs.** *Diseases of the Nervous System*, 1975(Apr), Vol 36(4), 164-166.—Discusses 4 mechanisms involved in the modification of the action of one psychoactive drug by another. (20 ref)

1063. Bowen, Florry P.; Kamienny, Robin S.; Burns, Margaret M. & Yahr, Melvin D. (Mt Sinai School of Medicine, City U New York) **Parkinsonism: Effects of levodopa treatment on concept formation.** *Neurology*, 1975(Aug), Vol 25(8), 701-704.—Compared concept formation in 71 parkinsonian patients and 35 controls matched for age and WAIS verbal IQ. It was found that the patients formed significantly fewer concepts, as measured by the Wisconsin Card Sorting Test (WCST). Patients had difficulties in shifting sets and were unable to attend to the completion of a concept. Levodopa-treated Ss were able to produce more correct responses but were still unable to maintain the correct responses to produce more correct concepts than non-levodopa-treated Ss. The behavior of the parkinsonian Ss on the WCST is similar to that of patients who have undergone frontal lobectomy. In addition, results indicate that levodopa therapy may improve "vigilance" without increasing the patient's overall cognitive ability. (33 ref)—*Journal abstract.*

1064. Bryan, William J. **The youth drugs.** *Journal of the American Institute of Hypnosis*, 1975(Jan), Vol 16(1), 16-19.—Reviews the development of procaine or gerovital therapy in the treatment of aging. Report effects of the therapy are attributed to the MAO inhibition quality of the drugs.

1065. Casey, Daniel E. & Denney, Duane. (Brown U, Medical Education Program, Section of Psychiatry & Human Behavior) **Deanol in the treatment of tardive**

dyskinesia. *American Journal of Psychiatry*, 1975(Aug), Vol 132(8), 864-867.—A 59-yr-old man who developed severe tardive dyskinesia after the termination of long term phenothiazine therapy was successfully treated with deanol, a possible precursor of acetylcholine. Physiological measurements were obtained to quantify the clinical course. The practical and heuristic implications of these observations are discussed and further consideration of therapy directed toward enhancement of cholinergic activity in the CNS is suggested.—*Journal abstract.*

1066. Coleman, James H. & Evans, William E. **Pharmacotherapy of the acute alcohol withdrawal syndrome.** *Diseases of the Nervous System*, 1975(Apr), Vol 36(4), 151-154.—Reviews potential adverse effects that may result from drugs commonly used for management of the acute alcohol withdrawal syndrome. (25 ref)

1067. Fischer, P.-A. (Johann Wolfgang Goethe-U Frankfurt/Main, Zentrum der Neurologie und Neurochirurgie, W Germany) [L-dopa therapy in Parkinson's disease: Its present state and problems.] (Germ) *Nervenarzt*, 1974(Dec), Vol 45(12), 617-627.

1068. Fiume, Sebastiano. (U Roma, Clinica delle Malattie Nervose e Mentali, Italy) [Regarding psychiatric changes during neuroleptic therapy.] (Ital) *Rivista di Psichiatria*, 1974(Nov-Dec), Vol 9(6), 544-549.—Argues that chronic schizophrenic patients may undergo a pathogenic syndromic mutation under the influence of neuroleptic therapy that makes it difficult for them to come back to reality.

1069. Gallant, D. M. et al. (Tulane U, Medical School) **Pipotiazine palmitate: An evaluation of a new long acting intramuscular antipsychotic agent in severely ill schizophrenic patients.** *Diseases of the Nervous System*, 1975(Apr), Vol 36(4), 193-196.—Studied the therapeutic dosage range of pipotiazine palmitate and evaluated its side effects and toxicity potential. 24 hospitalized schizophrenic patients were given incrementally increasing dosages until the achievement of a therapeutic effect or the appearance of limiting side effects was noted. The optimal dosage range for severely ill schizophrenic patients was indicated as between 100-600 mg once monthly, with only extrapyramidal side effects indicated. Therapeutic activity was delayed for 3-4 days after injection.—R. Tomasko.

1070. Gisselman, A. & Marin, A. [A true antidepressant: 19,560 R.P.] (Fren) *Information Psychiatrique*, 1975(Feb), Vol 51(2), 213-219. Presents a chemical analysis of the drug 19,560 R.P., and describes a clinical trial with 50 women (mean age = 39.5 yrs, range 17-68 yrs) suffering from various types of depressive illness. Each S received a single morning dose of the drug in one of 4 possible administrations and mean doses: iv (34 mg), intramuscular (50 mg), oral (167 mg), or oral after iv or intramuscular (110 mg). There were 41, 3, 6, and 39 Ss in these treatment groups respectively, and the time under treatment was respectively 2-12, 5-8, 4-15, and 2-13 days. Results were assessed on a 5-point scale ("very good"-"bad") and the response to treatment of 70% of the patients fell into the "very good" and "good" categories. Various psychological side effects occurred, specific to individual patients, but there were no physical or sedative effects.—C. A. Sherrard.

1071. **Gottschalk, Louis A. et al.** (U California, Medical Coll, Irvine) **Thioridazine plasma levels and clinical response.** *Comprehensive Psychiatry*, 1975(Jul-Aug), Vol 16(4), 323-337.—The relationship between indices of plasma thioridazine concentration (half-life, area under curve, peak level) and clinical response was examined over a 10-day period in 25 21–55 yr old patients with severe to moderately severe acute schizophrenia, following a single oral dose (on Day 1) of a placebo and of thioridazine (4 mg/kg on Day 6). Significant improvement in only 2 of 18 Brief Psychiatric Rating Scale (BPRS) items occurred predrug (Days 1–6), namely in Guilt and Grandiosity. No predrug improvement was observed on the other BPRS items, Hamilton Rating Scale for Depression, Wittenborn Rating Scale, or Gottschalk-Gleser social alienation–personal disorganization scores derived by content analysis from 5-min speech samples. Following the single dose of thioridazine, a significant average decrease was noted within 24 hrs in the social alienation–personal disorganization scores, and within 48 hrs in 9 subscales of the BPRS, 2 of 4 factor scores of BPRS, 3 of 4 Hamilton Rating Scale for Depression factors, and 1 of 6 Wittenborn Rating Scale factors. Significant correlations were found between indices of plasma thioridazine levels and favorable clinical responses on certain behavioral and psychological features of the schizophrenic syndrome. (28 ref) —*Journal summary*.
1072. **Hanlon, Thomas H.; Blatchley, Robert J. & Kurland, Albert A.** (Maryland Dept of Health & Mental Hygiene, Psychiatric Research Ctr, Baltimore) **Effects of control techniques on therapeutic outcome in a controlled clinical trial.** *International Pharmacopsychiatry*, 1975, Vol 10(3), 169-176.—Undertaken in the context of a controlled drug trial involving 124 newly admitted psychiatric hospital patients, this study compared the effectiveness of a "doctor's choice" (DC) method of administering psychotropic drugs vs an experimentally determined treatment regimen employing random assignment and double-blind procedures. The 32-day drug trial sought to determine the comparative effectiveness of thioridazine-placebo, thioridazine chlorthalidoxepoxide, and thioridazine-imipramine with the daily dosage of openly administered thioridazine ranging from 100 to 900 mg and dosages for chlorthalidoxepoxide and imipramine, administered in a double-blind fashion, fixed at daily dosages of 30 and 75 mg, respectively. DC medication, consisting of a choice (by a research physician) of any of the 3 experimental medications determined on the basis of judged clinical need, was added as a 4th treatment category. Criteria of effectiveness included a battery of standardized psychiatric rating scales and global measures of improvement completed by research team members and ward physicians. Outcome results for the DC group compared to those for a single control group made up of individuals matched with DC patients on the basis of drug assignment indicated an essentially similar clinical effectiveness under both DC and control treatment conditions. Generalization of the findings was limited by the fact that the main treatment effect, attributable to thioridazine, overshadowed the more subtle action of the ancillary drugs. *Journal abstract*
1073. **Horowitz, Harvey A.** (Inst of the Pennsylvania Hosp, Adolescent Treatment Unit, Philadelphia) **The use of lithium in the treatment of the drug-induced psychotic reaction.** *Diseases of the Nervous System*, 1975(Apr), Vol 36(4), 159–163.—Examined 4 cases involving the use of lithium to treat an LSD-induced psychotic reaction. Ss were adolescent females characterized by disturbances of affect, motility, and thinking. Symptoms observed include euphoria, irritability, hostility, depression, and hyperactivity. Findings indicate that within the group of patients having psychotic reactions to LSD, there is a subgroup who will express the reaction in a manic form. This subgroup is considered likely to respond to lithium therapy. (30 ref)—*R. Tomasko*.
1074. **Huestos, Robert D.; Arnold, L. Eugene & Smeltzer, Donald J.** (US Navy Regional Medical Ctr, Norfolk, VA) **Caffeine versus methylphenidate and d-amphetamine in minimal brain dysfunction: A double-blind comparison.** *American Journal of Psychiatry*, 1975(Aug), Vol 132(8), 868-870. Compared the efficacy of caffeine, methylphenidate, and dextroamphetamine in 18 children (mean age, 8.5 yrs) with minimal brain dysfunction using a double-blind crossover design. Dosages were 80 mg of caffeine, 5 mg of dextroamphetamine, and 10 mg of methylphenidate. The slight improvement with caffeine was not significantly better than placebo. Both prescription drugs resulted in significant improvement and were significantly superior to caffeine. It is suggested that the discrepancy between these results and an earlier, more optimistic report by R. Schnackenberg (see PA, Vol 51:3662) may stem from the use in this study of pure caffeine rather than whole coffee.—*Journal abstract*.
1075. **Johnston, Linda.** (PharmChem Research Foundation, Palo Alto, CA) **Gerovital therapy and preserving youth.** *PharmChem Newsletter*, 1975(Jun-Jul), Vol 4(6), 5 p. Summarizes clinical, experimental, and pharmacological data concerning Gerovital, an MAO inhibitor with procaine as its active ingredient, which is being considered for licensing in the US as an antidepressant and which is in use in Romania as a geriatric cure. Although Gerovital is claimed to have positive effects on the aging process and its syndromes (including those of CNS origin), investigations of its useful and harmful effects and mechanism of action are as yet indecisive.
1076. **Kochansky, Gerald E. et al.** (Harvard U, Medical School) **The differential effects of chlorthalidoxepoxide and oxazepam on hostility in a small group setting.** *American Journal of Psychiatry*, 1975(Aug), Vol 132(8), 861-863.—Compared the effects of chlorthalidoxepoxide (10 mg 3 times day), oxazepam (15 mg 3 times/day), and placebo on hostility, as an inner motivational or arousal state, in 33 moderately and highly anxious male research volunteers (mean age, 24.5 yrs). Data from the Buss-Durkee Hostility Inventory support the hypothesis that chlorthalidoxepoxide-induced increases in motivational hostility are more frequent and intense than those associated with placebo and oxazepam. Data also suggest that oxazepam may be a more specific "hostility tranquilizer" than other benzodiazepines. (18 ref)—*Journal abstract*.
1077. **Loreto, D.** (Hosp Psichiatrico Provinciale, Como, Italy) **[Haloperidol therapy and changes in**

Rorschach responses of schizophrenics.] (Ital) *Neuropsychiatria*, 1973(Jan-Jun), Vol 29(1-2), 81-97.—Compares projective test responses during and after withdrawal of a continued course of neuroleptic therapy. 21 male schizophrenics, 29-58 yrs old and hospitalized 2-13 yrs, were administered the Rorschach after receiving 4 mg of haloperidol daily for at least 1 yr. Ss were then retested with the Behn-Rorschach after suspension of chemotherapy for 1 mo. A deterioration of intellectual efficiency (decrease in R , increase in W , decline in F + %, reduction in D and Dd), was found after drug withdrawal. Greater evidence of anxiety, loss of ego control, and poor reality testing is also reported. Supporting these findings were clinical observations of increased delusional thinking, hallucinatory and agitated behavior, and decreased work performance after discontinuation of haloperidol therapy. (French & German summaries) (49 ref)—*English summary*.

1078. Ludwig, Barry I. & Marsan, Cosimo A. (NIH, National Inst of Neurological Diseases & Stroke, Bethesda, MD) **EEG changes after withdrawal of medication in epileptic patients.** *Electroencephalography & Clinical Neurophysiology*, 1975(Aug), Vol 39(2), 173-181.—55 patients with intractable partial seizures whose on-medication EEGs demonstrated either predominantly focal epileptiform lesions or absence of paroxysmal activity were studied, and the effect of withdrawing all anticonvulsive drugs on their EEGs was observed. 4 types of response were encountered: (a) no effect (20%); (b) specific (focal) activation (25%); (c) complex activation (29%) with wide spread of the initial on-medication focus or appearance of additional independent epileptogenic foci; and (d) "nonspecific" activation (63%), consisting of bursts of either bilaterally synchronous and frontally dominant spike and waves, triphasic waves, or sharp slow complexes, or smaller amplitude rapid and diffuse spike-and-wave complexes. Performing off-medication tracings seems to be of greatest value in patients with partial seizures and EEGs revealing either a relative paucity or definite absence of epileptiform discharges. The occurrence of a "nonspecific" response in a questionable epileptic during the off-medication period, on the other hand, should be interpreted with caution. (French summary)—*Journal summary*.

1079. Mascia, Armond V. **Psychotropic agents in the management of chronic asthmatic children.** *Journal of Asthma Research*, 1974(Dec), Vol 12(2), 73-76.—Discusses the selection and use of psychotropic drugs in the treatment and control of severe asthma in children in a residential treatment hospital. The drugs are used in a multidisciplinary program to help the child become more independent and adequate. Dosages and types of psychotropic agents used are given, but no data on ages and weights of the children. Medications used included the anxiety-reducing drugs (major and minor tranquilizers), antidepressants, stimulants for hyperactivity, and agents used for personality disorders. The effectiveness of various drugs is compared. Medical and psychological reasons for their use are given, but it is emphasized that they should be only a part of the treatment of chronic asthma in children.—*E. S. Bishop*.

1080. Meadow, Arnold; Donlon, Patrick T. & Blacker, Kay H. (U California, Medical School, Davis) **Effects of phenothiazines on anxiety and cognition in schizophrenia.** *Diseases of the Nervous System*, 1975(Apr), Vol 36(4), 203-208.—Studied the causal relationship between anxiety and psychotic decompensation, using 2 samples of schizophrenics. Group 1 was composed of 26 outpatients (mean age, 38 yrs) stabilized on neuroleptics, and Group 2 was composed of 18 patients (mean age, 26.6 yrs) with more acute symptomatology. Group 1 Ss were studied during a period of abrupt medication withdrawal with secondary psychotic decompensation, and Group 2 Ss during a period of psychic reintegration on active medication. The Brief Psychiatric Rating Scale, the Clinical Global Impression rating, and a free-association interview were used. Results indicate a significant increase in anxiety and cognitive disorganization following phenothiazine withdrawal in Group 1. The theory is suggested that the different symptoms of schizophrenics should be considered to have different meanings. Results also suggest that considerable caution be used in the discontinuation of phenothiazine medication, especially with patients on high dosages.—*R. Tomasko*.

1081. Mikkelsen, Edwin J. & Rosenbaum, Alan H. (Massachusetts Mental Health Ctr, Boston) **Amiripryline-perphenazine overdose producing delayed hypomania in manic-depressive illness.** *American Journal of Psychiatry*, 1975(Aug), Vol 132(8), 870-871.—Describes the case of a 26-yr-old woman who became hypomanic after awakening from a semicomatose state induced by an overdose of amiripryline-perphenazine (Triavil). She had been depressed and had a strong family history of manic-depressive illness. The case supports previous evidence that dopamine is a mediator for mania.—*Journal abstract*.

1082. Munjack, Dennis J. (Adult Outpatient Psychiatry Clinic, Los Angeles, CA) **Overcoming obstacles to desensitization using in vivo stimuli and Brevital.** *Behavior Therapy*, 1975(Jul), Vol 6(4), 543-546.—Describes therapy in which a female with multiple phobias showed substantial improvement within 10 sessions. Gradual withdrawal of the drug during prolonged exposure apparently facilitated transfer of the medication's antianxiety effects to the nondrug state. (21 ref)

1083. Priest, Robert G. & Netter, Petra. (U London, St Mary's Hosp Medical School, England) **Hostility, somatic symptoms, and recovery with antidepressants.** *International Pharmacopsychiatry*, 1975, Vol 10(3), 137-141.—Administered either protriptyline or nortriptyline in a double-blind study to psychiatric patients. Ss were assessed at intervals during the trial on the Zung Self-Rating Depression Scale and the Hostility and Direction of Hostility Questionnaire. A good response to treatment was related to low ratings on scales measuring criticism of self and others and projected (paranoid) hostility. Outcome was better with initial low scores on depressive symptoms, particularly unworthiness, restlessness, and constipation. Relations among depressive symptomatology and side effects were observed, including loss of interest and drowsiness, lack of clear mind and blurred vision, loss of libido and constipation, and ideas of suicide and dry mouth.—*Journal abstract*.

1084. Quidu, M.; Hillion, C. & Le Corre, A. [The use of Heptaminol in cardiovascular syndromes associated with psychotropic drugs: A clinical study.] (Fren) *Information Psychiatrique*, 1974(Dec), Vol 50(10), 1053-1059.—Reports 2 studies in which Heptaminol was found to improve blood pressure anomalies and subjective discomfort among psychiatric patients being treated with psychotropic drugs.

1085. Rack, P. H. & Vaddadi, K. (Lynfield Mount Hosp, Bradford, England) **Side effects of tricyclic antidepressant drugs with particular reference to dothiepin.** *International Pharmacopsychiatry*, 1975, Vol 10(3), 129-136.—Compared self-reports of side effects from 15 patients receiving dothiepin, a thio-analog of amitriptyline, and 20 patients on other tricyclic compounds (amitriptyline, lentizol, and clomipramine). The high incidence of complaints beforehand and the overall reduction during 2 wks' treatment, correlating with clinical improvement, indicates that a comparison of side effects is unreliable unless the pretreatment incidence is recorded.—*Journal abstract*.

1086. Ropert, L. [Low doses of cyamepromazine (Tercian) in the treatment of nonpsychotic disorders.] (Fren) *Information Psychiatrique*, 1975(Jan), Vol 51(1), 87-94.—Studied the efficacy of low dose of cyamepromazine in treating a variety of mental disorders. Ss were 70 female and 59 male ambulatory or hospitalized patients, with a mean age of 41.23 yrs. Daily oral doses of 25-200 mg were given in insomnia, senile disorders, chronic alcoholism, personality disorders, psychosis, depression, and neurosis. The mean length of treatment was 63 days. Results were categorized as complete cessation of symptoms (13.2% of cases), significant improvement (37.2%), partial improvement (30.2%), or no improvement (19.4%). There was no apparent systematic distribution of the mental disorders across these categories, except that all cases of alcoholism and senile disorders responded to treatment. It is concluded that low doses of cyamepromazine reduce symptoms effectively in the disorders studied, without systematic side effects. (16 ref)—C. A. Sherrard.

1087. Safer, Daniel J. & Allen, Richard P. (Johns Hopkins U, Medical School, Div of Child Psychiatry) **Stimulant drug treatment of hyperactive adolescents.** *Diseases of the Nervous System*, 1975(Aug), Vol 36(8), 454-457.—Evaluated the characteristics and classroom behavior changes of 38 hyperactive (HA) schoolchildren treated with stimulants during 1969-1974. 14 Ss who began taking stimulants before age 8 yrs were compared to 11 who were initiated on stimulant treatment at age 13-16. Next, 13 Ss who continued on stimulants into their teens were studied to compare their preteen with their teenage drug response. Major findings were: (a) Therapeutic response of stimulants for hyperactivity did not significantly change from age 6 to 16. (b) Pretreatment teacher ratings indicated that as a group, teenage HA Ss were as inattentive as younger HA Ss but less aggressive and overactive. (c) Mean dose of stimulant to achieve a successful classroom response for schoolage HA Ss did not significantly increase with age. (d) Parental resistances to stimulants were not related to the age of the HA S, but behavioral resistances by the S increased significantly during the teens. (e) There were

no reports of abuse of stimulants by teenagers. (26 ref)—*Journal summary*.

1088. Sim, Myre; Reid, David; Pallett, Joyce & Gordon, Edward. (United Birmingham Hosp, England) **The Hamilton Rating Scale: An assessemnt based on a dothiepin ("prothiaden") versus imipramine ("tofranil") clinical trial.** *International Pharmacopsychiatry*, 1975, Vol 10(3), 142-148.—Compared the Hamilton Rating Scale for Depression with a system of psychiatric assesment and recording designed by M. Sim (1971), an overall recording of psychiatric data including both objective and subjective data. 76 patients were studied, of whom 40 received imipramine and 36 received dothiepin. Data were collected before and after treatment and at 1-, 2-, and 6-wk intervals. Results show that there was closer agreement with the full Sim assessment method than with the single diagnostic area of depression covered by the Hamilton scale. It is concluded that the Hamilton scale is more general than specific in its application.—*Journal abstract*.

1089. Snarr, Richard W. & Ball, John C. (Eastern Kentucky U) **Involvement in a drug subculture and abstinence following treatment among Puerto Rican narcotic addicts.** *British Journal of Addiction*, 1974(Sep), Vol 69(3), 243-248.—Conducted a follow-up study of 108 male native Puerto Rican opiate addicts. Interview data indicated that 38% of those with little involvement in a drug subculture were "cured," whereas only 10% of those with extensive involvement were cured. Further analysis showed that the most significant finding was that involvement in a subculture among those who began opiate use by the age of 20 or before had little relationship to being cured, but involvement among those who began opiate use at age 21 or over was highly related to being cured. These findings indicate differences in some basic social dimensions among a relatively homogenous sample of addicts and suggest factors which might be useful considerations for successful treatment.—*Journal summary*.

1090. Speciali, José G. & Lison, Michel P. (Ribeirao Preto, Faculdade de Medicina, Sao Paulo, Brazil) **[Undesirable effect of antiepileptic therapy in a patient with functional maturational epilepsy.]** (Port) *Arquivos de Neuro-Psiquiatria*, 1973(Sep), Vol 31(3), 207-213.—Describes the incidence of nonconvulsive epilepsy with EEG features of Lennox syndrome in a 4-yr-old patient treated with diphenylhydantoin. At the beginning of treatment the patient had convulsive epilepsy associated with multiple spikes in the EEG. The role of the drug in establishing severe iatrogenic epilepsy is discussed.—*English summary*.

1091. Teja, Jagdish S.; Shah, Dinesh K. & Wig, Narendra N. (U Virginia, Medical School) **Benzocetamine (Tactin) versus placebo: A double-blind cross over study in anxiety neurotics.** *Current Therapeutic Research*, 1975(Aug), Vol 18(2), 354-358.—Compared benzocetamine, a new antianxiety agent, with a placebo in the treatment of 25 outpatients with anxiety neurosis. Benzocetamine was not significantly better than placebo in reducing the total scores on a 25-item objective anxiety rating scale. It had a significant effect on the symptom of anxiety. Placebo produced significantly better results in some patients, which might be due to the

lesser number of patients who had side effects on placebo.—*Journal abstract.*

1092. Verhaegen, J. J. (Psychiatric Hosp St Bavo, Noordwijkerhout, Netherlands) **The long-term use of high doses of fluphenazine enanthate and fluphenazine decanoate.** *Comprehensive Psychiatry*, 1975(Jul-Aug), Vol 16(4), 357-362.—72 male 27-50 yr old patients, mostly chronic schizophrenics refractory to other treatments, were given fluphenazine enanthate or fluphenazine decanoate in doses ranging from 1 ml every 3 wks to 5 ml every week. EKGs, ocular examinations, and blood chemistries were performed on those given the highest doses. Long-term treatment with high doses revealed no untoward toxic effect or evidence of accumulation. These difficult patients were well controlled on the injections, occasionally supplemented with oral medication. The need for flexibility of dosage is stressed.—*Journal summary.*

1093. West, Sheila K. (Johns Hopkins Medical Inst, Health Services Research & Development Ctr) **Providers as prescribers: Attitudes toward aspects of prescribing their relationship to management of hypertension in the elderly.** *Gerontologist*, 1975(Aug), Vol 15(4), 317-319.—Noted major differences in use of literature and industry sources of drug information between physicians and nonphysician providers as well as differences in patient education regarding drugs, with nonphysicians showing a tendency to provide information on drug therapy more frequently than physicians. There were indications of effect of setting on drug attitudes.

Hypnotherapy

1094. Fitzpatrick, Lee J. **How to stop from running.** *Journal of the American Institute of Hypnosis*, 1975(Jan), Vol 16(1), 28-29.—Presents the case history of a 39-yr-old housewife with severe arthritis in the hands and feet who was successfully treated by hypnosis.

1095. Jennings, G. Scott. **New insights in the treatment of obesity, with restricted food allowance, medication and hypnosis.** *Journal of the American Institute of Hypnosis*, 1975(Jan), Vol 16(1), 32-34, 48.

1096. Parejko, James E. **A boy named Michael.** *Journal of the American Institute of Hypnosis*, 1975(Jan), Vol 16(1), 35-41, 48. Reviews an alleged account of reincarnation as supported by hypnotic age regression. It is suggested that the details of the regression story are explained more efficiently by known principles of hypnosis rather than by reincarnation.—L. M. Croghan.

1097. Starker, Steven. (Yale U, Medical School) **Implications of the behavioral approach to hypnosis.** *American Journal of Psychotherapy*, 1975(Jul), Vol 29(3), 402-408. Reviews recent research concerning the importance of cognitive motivational variables (e.g., attitude and expectancy) in hypnosis and discusses the theoretical and clinical significance of this work. It is suggested that recognition of the importance of these variables can enhance the clinical practice of hypnosis through their deliberate manipulation. Lacking any firmly established explanation of hypnosis, practitioners may apply behavioral principles for which there is experimental support without committing themselves to a particular theoretical position. For this purpose hypnosis can be usefully conceptualized as a complex

configuration of interacting variables on several different levels, including cognitive, motivational, social, and physiological factors. (19 ref)—*Journal summary.*

Speech Therapy

1098. Elbert, Mary & McReynolds, Leija V. (U Kansas, Medical Ctr, Kansas City) **Transfer of /r/ across contexts.** *Journal of Speech & Hearing Disorders*, 1975(Aug), Vol 40(3), 380-387. Determined if training on any specific /r/ allophone would result in transfer to other /r/ allophones without specific training. 12 6-11 yr olds who were unable to imitate correctly 3 specific allophones in 40 stimulus items during baseline served as Ss. A multiple baseline design was used; 6 Ss served as controls while 6 were trained, after which the 1st 6 were trained. Each S received training on a randomly assigned syllable representing a specific allophone of /r/. After training, generalization to the untrained /r/s was assessed. Since most Ss increased the number of correct responses to items in several allophonic categories regardless of the specific allophone taught, the different allophones of /r/ may be members of the same response class rather than independent of one another.—*Journal abstract.*

Health Care Services

1099. Baig, Tara A. **The end of the queue.** *Carnets de l'Enfance*, 1975(Jan-Mar), Vol 29, 72-87.—Compares the approaches to the problems of early childhood in the Fifth Plan for India with those in the First Plan. Changes in emphasis have occurred, and progress has been made in approaches to child and youth benefit programs such as supplemental nutrition and delinquency.

1100. Bockoven, J. Sanbourne & Solomon, Harry C. (Dr. Harry C. Solomon Mental Health Ctr, Lowell, MA) **Comparison of two five-year follow-up studies: 1947 to 1952 and 1967 to 1972.** *American Journal of Psychiatry*, 1975, Aug, 796-801.—Compared results of 5-yr follow-up of 100 randomly selected patients committed to a community-oriented mental hospital in 1947 with those of a 5-yr follow-up of 100 randomly selected patients admitted to a community-based mental health center in 1967. Data show that both programs were successful in keeping patients with histories of long-standing mental illness in the community, even though the 1947 group did not receive any modern psychotropic medication. One unexpected finding is the suggestion that these drugs might not be indispensable; in fact, they might actually prolong the social dependency of some discharged patients.—*Journal abstract.*

1101. Caston, J. Christopher; Miller, William C. & Felber, William J. (Medical U of South Carolina) **Vector analysis of postcardiotomy behavioral phenomena.** *Diseases of the Nervous System*, 1975(Apr), Vol 36(4), 181-184.—Considers each behavioral manifestation resulting from heart surgery to constitute a vector summation of psychic, environmental, metabolic, and hemodynamic elements. (24 ref)

1102. Cole, John D.; Costanzo, Philip R. & Cox, Gary. (Duke U) **Behavioral determinants of mental illness concerns: A comparison of "gatekeeper" professions.** *Journal of Consulting & Clinical Psychology*, 1975(Oct), Vol 43(5), 626-636.—Asked members of 5 "mental

illness gatekeeper" professions ($N = 178$) from 2 different communities to evaluate 190 behavioral items for the mental illness implications of the behavior described in each item. Items were largely derived from the MMPI and were analyzed in terms of 13 content homogeneous clusters. Professional groups differed significantly in their general readiness to "see" mental illness in the total pool of items. Groups also differed in the ways they defined mental illness in behavioral terms. This was evidenced by between-groups differences on cluster scores when total level of endorsement was used as a covariate. Main effects for professional group differences were obtained for those clusters of items containing the less deviant forms of behavior. For those clusters containing the more severe forms of deviance, Professional Group \times Community interaction effects were found. Results are discussed in terms of the professional and social functions that each of these professions seems to serve in the 2 types of communities surveyed.—*Journal abstract.*

1103. Dobiáš, J. (U Karlova, Prague, Czechoslovakia) [Importance of industrial psychiatry.] (Czec) *Ceskoslovenská Psychiatrie*, 1974(Jun), Vol 70(3), 180-181.—Discusses the opposition during the early postwar years to the introduction of psychiatric services in factories, calling it naive to expect that human work relations, in socialism or in the most ideal society, would ever be so perfect that factors causing discontent, anxiety, conflicts, unhappiness, illness, etc, among individuals would completely disappear. 2 main roles of industrial psychiatry are discussed. (a) In the field of mental hygiene, psychiatry should be involved in mass education, information, and counseling of workers, through lectures, TV, radio, and the press. (b) The other role is more strictly medical, such as individual treatment of those workers who are really ill and whose functioning in the factory is impaired by behavior disorders and psychopathologies. Since in certain industrial areas psychiatrists are still required to evaluate and predict the fitness of job applicants, the future success of industrial psychiatry will also depend on its practical effectiveness in saving energy and money for industrial enterprises.—*V. Fischman.*

1104. Ettlinger, Ruth. Evaluation of suicide prevention after attempted suicide. *Acta Psychiatrica Scandinavica*, 1975, Suppl 260, 5-135.—Studied the effectiveness of a suicide prevention effort by comparing its effect on a group of 670 attempted suicide patients with a similar control group of 681. Results indicate similar proportions of reported attempted suicides and similar mortalities in the 2 groups. The only effect of the preventive scheme noted was a mortality reduction in the Ss with a record of criminal or drunken behavior. (10 p ref)—*Journal summary.*

1105. Galkowski, Tadeusz (Ed). [The elements of defectology.] (Polh) Warsaw, Poland: Akademia Teologii Katolickiej, 1975. 418 p.—Discusses the problems of care, education, and rehabilitation of mentally retarded children and physically disabled adults, and emphasizes therapy and education of speech and hearing disordered persons. (English & French summaries)

1106. Gopalan, Coluthur. Nutrition and India's children. *Carnets de l'Enfance*, 1975(Jan-Mar), Vol 29,

51-60.—Proposes that the most efficient way to implement the Fifth Plan's policies of reducing malnutrition among India's poor would be through simple supplementary nutritional programs for the preschool and school-age child and education for the mother.

1107. Grun, John. Twenty-five years of UNICEF in India. *Carnets de l'Enfance*, 1975(Jan-Mar), Vol 29, 3-8.—Describes the evolution of the role of the United Nations Children's Fund in India. It has come to focus on planning and implementing long-term projects for child benefit.

1108. Kasl, Stanislav V. (Yale U. Medical School) Issues in patient adherence to health care regimens. *Journal of Human Stress*, 1975(Sep), Vol 1(3), 5-17, 48.—Examines an area of personal health behavior in which the possible link between stress and health status is not primarily a biological but a behavioral one. A review of empirical literature is organized around 4 topics: the limited payoff from the search for stable sociodemographic and personality correlates of adherence, the inadequacy of current theoretical formulations, the role of the doctor, and the doctor-patient interaction. The latter emphasizes mutual expectations rather than a one-way transfer of information. The need for a firmer linkage with the conceptual and empirical literature on stress and coping is discussed. (86 ref)—*Journal abstract.*

1109. Koch, Michael. (U Minnesota, Div of Child & Adolescent Psychiatry) Civilian psychiatric evaluations for young men facing the draft. *Adolescence*, 1975(Spring), Vol 10(37), 75-82.—Presents the history of psychiatric rejections of potential military draftees. 101 young men who sought draft exemptions because of perceived psychiatric problems are discussed. They ranged from those who quickly admitted having no real problem to those who were genuinely ill. Guidelines for similar evaluations are provided.

1110. Luckey, Robert E. & Neman, Ronald S. (National Assn for Retarded Citizens, Arlington, TX) The President's panel recommendations: Today. *Mental Retardation*, 1975(Aug), Vol 13(4), 32-34. Surveyed state mental retardation program coordinators regarding their opinions with respect to progress in achieving the President's Panel recommendations of 1962 and the continuing relevance of these recommendations today. Respondents were 26 chief administrators of retardation divisions, 5 assistant directors, and 8 state office staff. Although Ss felt that progress has been made, they believed that there was substantial room for further improvement in all areas covered by the survey. Recommendations by the coordinators for action programs in the present decade were found to focus largely upon achieving deinstitutionalization and appropriate community service alternatives.—*Journal abstract.*

1111. Mahadevan, Meera. Children without childhood. *Carnets de l'Enfance*, 1975(Jan-Mar), Vol 29, 42-50.—Notes that the field worker is the key to the success of a social service program providing basic services to very young children in urban slums in India. The quality of selection procedures and in-service training for these workers is considered vital.

1112. Meleis, Afaf I. (U California, San Francisco) Role insufficiency and role supplementation: A conceptual framework. *Nursing Research*, 1975(Jul-Aug), Vol

24(4), 264-271.—Describes a theoretical basis for the diagnosis of nursing problems, centered on the concepts of role insufficiency and role supplementation. Role insufficiency is anticipated and experienced by clients during role transitions with developmental, situational, and health-illness implications. The conceptual basis of nursing intervention is considered role supplementation, and components, strategies, and processes of role supplementation are described. Conditions that predispose clients in the health setting to undergo role transition, conditions under which aspects of role transition may become nursing problems, and the role of the nurse in dealing with client's role transition problems are described. A predictive and prescriptive paradigm showing the interaction of construct components is presented. (30 ref)—*Journal abstract.*

1113. Mills, Mitchell; Mimbs, Donald; Jayne, Edward E. & Reeves, Robert B. (National Naval Medical Ctr, Bethesda, MD) **Prediction of results in open heart surgery.** *Journal of Religion & Health*, 1975(Jul), Vol 14(3), 159-164. 100 open heart surgery patients were interviewed and rated preoperatively in order to determine whether psychological factors (depression, pessimism) affect surgery outcome. It is reported that surgery outcome had a strong correlation with results obtained by the scale, although no correlational data are published in the report.—*F. Hardt.*

1114. Myerson, David J.; Nadeau, Conrad J.; Stratton, Richard W. & Kaplan, Martha. (Worcester State Hosp, MA) **The phasedown of the Worcester State Hospital.** *Massachusetts Journal of Mental Health*, 1974(Fal), Vol 5(1), 45-56. Describes the problems created for patients, staff, and communities as patient care was shifted in part, between 1963 and 1973, from a centralized institution (the state hospital) to care in community facilities. Measures taken to deal with these problems are described. Both gains and losses of the phasedown are specified. It is concluded, however, that plans to convert completely to community-based programs during the next few years are probably not feasible. —*P. R. Sweet.*

1115. Pranulis, Maryann F.; Dabbs, James M. & Johnson, Jean E. (Yale U) **General anesthesia and the patient's attempts at control.** *Social Behavior & Personality*, 1975, Vol 3(1), 49-54. 10 male and 10 female patients undergoing elective surgery were instructed to be active or passive while awaiting surgery. Pulse measures were taken as patients approached the operating table, received anesthesia, and lost consciousness. All patients increased in pulse rate before anesthesia. Immediately after initial anesthesia the groups diverged, active patients decreasing and passive patients increasing in pulse rate. A decrease in pulse rate is clinically desirable. It is suggested that a patient's active participation may show that the staff is responsive to his needs, making him more willing to submit to anesthesia. *Journal abstract.*

1116. Velasco, Marcos; Velasco, Francisco; Maldonado, Héctor & Machado, Jesús P. (IMSS, Scientific Research Dept, Mexico) **Differential effect of thalamic and subthalamic lesions on early and late components of the somatic evoked potentials in men.** *Electroencephalography & Clinical Neurophysiology*, 1975(Aug), Vol 39(2), 163-171.—Investigated the effect

of thalamic, subthalamic, and combined unilateral lesions on early and late components of somatic evoked potentials (SEPs) in 16 patients operated on for contralateral dyskinetic movements. SEPs were produced by stimulation of the left and right median nerves and recorded at the corresponding somatosensory body regions. EEG frequencies and reaction time (RT) were also determined. All cases with either thalamic or combined lesions involving the thalamic nucleus showed an ipsilateral reduction in amplitude of the late SEP components and EEG frequency and a contralateral increase in RT. A peculiar form of "inattention" to the contralateral hand was also observed. 2 cases with subthalamic lesions and quick postoperative recovery showed no changes in SEP, EEG, or RT, while 3 cases with similar lesions and slow recovery showed bilateral decreases in the amplitude of the late SEP components, EEG frequency, and an increase in RT. (French summary) (19 ref) *Journal summary.*

1117. Ware, John E.; Wright, W. Russell; Snyder, Mary K. & Chu, Godwin C. (Rand Corp, Santa Monica, CA) **Consumer perceptions of health care services: Implications for academic medicine.** *Journal of Medical Education*, 1975(Sep), Vol 50(9), 839-848. Describes the factor analytic development of various measures of consumer perceptions of doctors and health care services. Index scores meeting factor analytic and reliability criteria were used to study consumer perceptions in relation to behavioral outcomes. Numerous dimensions of consumer perceptions were identified and described, including beliefs about quality of care, humaneness of health care delivery, and satisfaction with continuity of care, availability and convenience of services, and various access mechanisms (cost, payment mechanisms, and ease of emergency care facilities). Data from interviews with 903 18-92 yr old persons from a rural, largely poor area in Illinois show that these perceptions were related to differences in several estimates of health services utilization. The use of empirically derived index scores is in contrast to the common practice of using individual questionnaire items as the unit of analysis in health care research. Findings are discussed in relation to program planning and evaluation in medical education. (22 ref) *Journal abstract.*

1118. Warnecke, Richard B. et al. (U. Illinois, Survey Research Lab, Chicago Circle) **Contact with health guides and use of health services among Blacks in Buffalo.** *Public Health Reports*, 1975(May/June), Vol 90(3), 213-222. Results of a study with Black female inner-city residents show that personal contact of community members by unprofessional community residents show that personal contact of community members by unprofessional community residents increased the use of public health services. (39 ref)

Community Services & Mental Health Programs

1119. Aanes, David; Klaessy, Dale & Wills, James. (Fergus Falls State Hosp, MN) **The impact of a community hospital's psychiatric unit on a regional state hospital.** *Hospital & Community Psychiatry*, 1975(Sep), Vol 26(9), 596-598.—Reports study results

which show the new unit did not have a significant impact. It was found that the 2 facilities served different socioeconomic groups and therefore did not offer duplicate services.

1120. **Barter, James T.** (Sacramento County Mental Health Services, CA) **Sacramento county's experience with community care.** *Hospital & Community Psychiatry*, 1975(Sep), Vol 26(9), 587-589.—Describes the manner in which one county made the shift from institutional care for the mentally ill to community-based programs. The legislation precipitating the change and the public controversy surrounding the closing of state hospitals are discussed.

1121. **Bauer, John.** (Bernard M. Baruch Coll, City U New York) **The hot line and its training problems for adolescent listeners.** *Adolescence*, 1975(Spr), Vol 10(37), 63-69.—Describes a telephone hot-line service where 1/2 of the listeners were teenagers. The screening and training process is described. 14 types of problems that have occurred with teenage listeners (TL) are mentioned. It was found that TLs were likely to be more judgemental, and less giving and understanding and too often let the caller take control. They were more reliable for listening-shift attendance and had strong desires to improve.—A. Kricher.

1122. **Bonn, Ethel M.** (Fort Logan Mental Health Ctr, Denver, CO) **The impact of redeployment of funds on a model state hospital.** *Hospital & Community Psychiatry*, 1975(Sep), Vol 26(9), 584-586.—Describes what threatens to be the transition of an award-winning long-term-care mental health center to a classical state hospital. A chronological description is given of the events that occurred after funds were redeployed from the hospital to community resources.

1123. **Brown, Curtis F.** (Ohio State U) **Parents' perceptions of experiences associated with seeking community services for their preschool age mentally retarded child.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 865.

1124. **Cowen, Emory L. et al.** (U Rochester) **Evaluation of a preventively oriented, school based mental health program.** *Psychology in the Schools*, 1975(Apr), Vol 12(2), 161-166.—Reports on the effectiveness of the Primary Mental Health Project, designed for early detection and prevention of school maladaptation. The direct help-agents were nonprofessional child-aides. It is concluded that the children in the program showed significant improvement.—H. Kaczowski.

1125. **Elpers, John R.** (Orange County Dept of Mental Health, Santa Ana, CA) **Orange County's alternative to state hospital treatment.** *Hospital & Community Psychiatry*, 1975(Sep), Vol 26(9), 589-592.—Reports on the development of a local network of regionalized and centralized services, the goal of which is to provide all mental health services locally. The services now being rendered, their costs and staffing requirements, and the organizational structure established to administer them are described.

1126. **Franklin, Jack L. & Kittredge, Lee D.** (North Carolina Div of Mental Health Services, Management Information Systems, Raleigh) **Organizational problems in community mental health centers.** *Administration in Mental Health*, 1975(Spr), 60-65.—Argues that a com-

munity mental health center's (CMHC) response to confrontation with other groups over its boundaries and areas of jurisdiction will determine the role that a CMHC will play in meeting community needs. A defensive-adaptive approach leads to bureaucratization, cooptation of external sources of conflict, and an emphasis on survival. An offensive community manipulative approach is suggested which involves politicization, adoption of distinctive competencies and a certain form of induction. This approach leads to flexibility and growth of the CMHC. (26 ref)—R. J. Albers.

1127. **Hoefler, Sharon A. & Bornstein, Philip H.** (U Montana) **Achievement place: An evaluative review.** *Criminal Justice & Behavior*, 1975(Jun), Vol 2(2), 146-168.—Describes a community-based treatment facility for predelinquent boys. 3 distinguishing features of the Achievement Place program are elaborated: (a) the utilization of a token economy point system as a primary therapeutic tool, (b) the development of a series of well-controlled experiments enabling the establishment of functional relationships across behaviors, and (c) the training of teaching-parents. A variety of target behaviors are systematically reviewed. Overall evaluation of the Achievement Place program is undertaken in light of a number of issues considered relevant to scientific investigation. (2 p ref)—*Journal abstract*.

1128. **Kane, Thomas J.** (York County Counseling Services, Saco, ME) **Citizen participation in decision-making: Myth or strategy?** *Administration in Mental Health*, 1975(Spr), 29-45.—Presents 5 models of community participation in community mental health centers and synthesizes a new model which is dependent upon identifying and influencing community decision making. (24 ref)

1129. **May, Philip R.** (VA Hosp, Brentwood, Los Angeles, CA) **Adopting new models for continuity of care: What are the needs?** *Hospital & Community Psychiatry*, 1975(Sep), Vol 26(9), 599-601.—States that there are glaring, almost universal deficiencies in the organization of community resources for treating and rehabilitating the mentally ill, particularly psychotic patients. The deficiencies could be partly remedied by reorganizing psychiatric hospitals to play a key role in outpatient service delivery, and by paying more attention to the principles of continuity of care for psychotic patients. One way of doing both is through the model of a mini-mental-health-center adopted at a Veterans Administration hospital: the same teams provide active, continual care for patients regardless of whether they are in or out of the hospital. The program developed on one ward is described further in a 2nd paper (see PA, Vol 55:Issue 1), written by ward staff members and others.—*Journal abstract*.

1130. **McPhee, Carol B.; Zusman, Jack & Joss, Robert H.** (State U New York, Div of Community Psychiatry, Buffalo) **Measurement of patient satisfaction: A survey of practices in community mental health centers.** *Comprehensive Psychiatry*, 1975(Jul-Aug), Vol 16(4), 399-404.—Surveyed 67 federally funded community health centers which provided a mechanism for assessing patient satisfaction. 48 centers responded. Of those which indicated that they were assessing patient satisfaction in 1972, only 1/2 were doing so at the time of this

was the most widely used contraceptive method used in all 3 groups. The desire of seminary students for training and course offerings and the need for teamwork between ministers and medical doctors are discussed.—F. A. Hardt.

1138. Brooks, Paul R. (Family Counseling Ctr of Greater New Haven, CT) **Industry-agency program for employee counseling.** *Social Casework*, 1975(Jul), Vol 56(7), 404-410.—Describes how a family agency provides services to blue-collar workers on the job, as well as a training site for students.

1139. Burck, Harman D. & Peterson, Gary W. (Florida State U) **Needed: More evaluation, not research.** *Personnel & Guidance Journal*, 1975(Apr), Vol 53(8), 563-569.—Evaluation of present programs in counseling is considered more necessary than additional research. Some evaluation procedures are presented and discussed.—G. S. Speer.

1140. Erp, Sue H. (U Oregon) **A study of reactions to the film "Confrontations of Death."** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1075-1076.

1141. Greenberg, Lois I. (South Hills Child Guidance Ctr, Pittsburgh, PA) **Therapeutic grief work with children.** *Social Casework*, 1975(Jul), Vol 56(7), 396-403.—Describes the therapeutic techniques used to help 3 children work through their grief over the death of a parent. Presenting symptoms included academic deterioration, somatic complaints, withdrawal, depression, anxiety, and death fantasies. In all 3 families inadequate and unrealistic communication about death within the family existed.—M. W. Linn.

1142. Hill, Clara. (U Maryland) **A process approach for establishing counseling goals and outcomes.** *Personnel & Guidance Journal*, 1975(Apr), Vol 53(8), 571-576.

—Describes an approach in which the client is asked to list characteristics or qualities that are considered important, rank their relative importance, and rate how characteristic these traits are of him. When these terms are behaviorally stated, they become the basis of the Counseling Outcome Inventory (COI). Counselor and client then determine appropriate areas to consider in counseling sessions, specific action plans are devised, and specific goals selected. The client may be asked to project changes desired within a specific time. Changes in COI during or following counseling measure client satisfaction or the effects of counseling. A case study is presented to illustrate how COI may be used to facilitate the counseling process and measure client progress.—G. S. Speer.

1143. Ingwell, Nancy A. (U Missouri, Columbia) **A simulated handicapping experience as it effects attitude, awareness and responses to counseling problems.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1081.

1144. Kellner, Susan S. **Old age and chronic obstructive lung disease as social problems.** *Journal of Asthma Research*, 1974(Dec), Vol 12(2), 89-94.—Describes the social problems of old age: finances, family, health, and the fear of being placed in an institution. Health problems often include some form of obstructive lung disease; one authority estimates that 17% of elderly patients in nursing homes have asthmatic symptoms. It is stated that the general public is ignorant of the problems

of old age and of the role that social workers play in helping the elderly. The bureaucratic system used in 1 welfare office and how it affects the social worker dealing with the problems of the aged, is described in detail.—E. S. Bishop.

1145. Meier, G. (California Interagency Council on Family Planning, Berkeley) **A health-oriented program for emotionally disturbed women.** *Social Casework*, 1975(Jul), Vol 56(7), 411-417.—Describes initiation of group services which focused on health problems for emotionally disturbed women. A voluntary agency in close cooperation with county and state mental health agencies offered weekly sessions. Content of meetings with a social worker and nurse leader is described.—M. W. Linn.

1146. Paterson, George W. (U Iowa, School of Religion) **Ministering to the family of the handicapped child.** *Journal of Religion & Health*, 1975(Jul), Vol 14(3), 165-176.—Conducted an exploratory study with 22 sets of parents having a cerebral palsied child aged 4 yrs or younger; no hypothesis was advanced. Structured interviews and a sorting of statements were used as methods. In general, it appeared that religion could either help or hinder in dealing with the stresses of raising a disabled child.—F. Hardt.

1147. Stephenson, P. Susan. (U British Columbia, Div of Child Psychiatry, Vancouver, Canada) **The emotional implications of adoption policy.** *Comprehensive Psychiatry*, 1975(Jul-Aug), Vol 16(4), 363-367.—Discusses the controversy surrounding a proposed Canadian adoption reunion registry which would enable natural parents to contact an adopted child after the child reached the age of maturity; the literature on the psychological problems experienced by biologic and adoptive parents and the adoptee is also examined. Some of the problems found to affect adoptive parents were (a) the lack of a physical or emotional preparation period in waiting for the child, as is the case with parents during the pregnancy period, (b) the adopting parents' sorrow about their own inadequacy; (c) coming to terms with their own and their adopted child's attitude toward illegitimacy; (d) telling the child of his adoption (e) problems related to prevalent cultural attitudes; and (f) lack of ongoing support. (23 ref) —M. E. Pounsel.

1148. Weinrach, Stephen & Morgan, Lewis B. (Villanova U) **A bill of client rights and responsibilities.** *Personnel & Guidance Journal*, 1975(Apr), Vol 53(8), 557-562.—Proposes a client bill of rights in the counseling relationship, describing both rights and responsibilities of the client.—G. S. Speer.

Hospital Programs & Institutionalization

1149. Beksanan, Punthip; Sapp, Gary L. & Noisuwane, Tewin. (Chulalongkorn U, Faculty of Education, Bangkok, Thailand) **The utility of verbal models in changing self-esteem of institutionalized Thai and American adolescents.** *Journal of Social Psychology*, 1975(Aug), Vol 90(2), 155-161.—Studied the effects of 4 independent variables—nationality, age of verbal model, sex of verbal model, and age of S—on changes in level of self-esteem. Institutionalized 12-17 yr-olds 120 Thai and 120 American served as Ss. Treatment implementation

involved exposing the Ss to positive self-descriptive paragraphs and a positively scored self-esteem scale purportedly completed by an imaginary pen pal. Ss then wrote a self-descriptive paragraph for the pen pal. Pretest-posttest change scores were analyzed in a $2 \times 3 \times 2 \times 2$ ANOVA. Thai Ss gained significantly more than American Ss, and significant interactions for nationality by age of model, and sex of verbal model by age of S were obtained.—*Journal abstract.*

1150. Bentley, Joanne. (Asthmatic Children's Foundation, Ossining, NY) **A psychotherapeutic approach to treating asthmatic children in a residential setting.** *Journal of Asthma Research*, 1974(Sep), Vol 12(1), 21-25.—Examined methods of psychotherapeutic intervention with asthmatic children in a residential center. It was found that separation from parents for a significant period of time frequently will relieve asthma, especially when combined with milieu therapy in residential setting. Parentectomy (removal of child from home) decreases child's dependence on parents and increases child's self-confidence and trust in others; since the child is less anxious the severity of asthma decreases. M. M. Peshkin's (1959) emphasis on the need for individual psychotherapy is discussed for asthmatic child for whom milieu therapy approach is insufficient. According to a study for which no statistical data are reported, there is no relationship between degree or form of emotional disturbance of child and his/her response to therapeutic intervention.—*E. S. Bishop.*

1151. Blain, Daniel. (Philadelphia State Hosp, PA) **Twenty-five years of hospital and community psychiatry: 1947-1970.** *Hospital & Community Psychiatry*, 1975(Sep), Vol 26(9), 605-609.—The author, the 1st medical director of the American Psychiatric Association and president in 1964-65, presents an historical review of the 25 yrs between 1945 and 1970, a period in which there was a reawakening of interest in the mentally ill and mentally retarded after years of neglect. He lists major landmarks in mental health care during those years, describes the 1st Mental Hospital Institute held by the American Psychiatric Association in 1949, and presents an anecdotal footnote about the Joint Commission on Mental Illness and Health.—*Journal abstract.*

1152. Caplan, Clive. (State U New York, Stony Brook) **Emergency room use by patients from a family practice: Patterns of illness and motivation.** *Journal of Family Practice*, 1975(Aug), Vol 2(4), 271-276.—Studied private patients from a family practice to examine the total spectrum of illness taken to an emergency room over a 6-mo period and the motivation behind the patients' visits. Diagnoses were not distributed at random but fell into discrete patterns, and emergency room visits were made at times of self-perceived crisis when the private physician was considered inaccessible. (29 ref)

1153. Clark, Bruce A. (U Illinois, Urbana-Champaign) **The effect of a systematic program of physical activity upon the total daily activity level and self-care personal neatness of a group of institutionalized geriatric subjects.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 603

1154. Colten, Sterling I. & Langlois, Joseph. (Launton State H, MA) **Development of a screening scale for**

programming psychiatric rehabilitation. *Psychological Reports*, 1975(Aug), Vol 37(1), 293-294.—Developed a functional screening scale to assess quality and presence of behavior which may be related to adjustment. The purpose was to assess hospital adjustment and identify patients most capable of entering rehabilitation. 110 chronic psychiatric patients' scores on the scale were correlated with ratings of the MACC Behavioral Adjustment Scale to measure functional adjustment. The screening scale may be used to assess the chronic's current behavioral capacities as they relate to treatment planning and their potential for rehabilitation.—*Journal abstract.*

1155. Dinwiddie, F. William. (Edgemeade Treatment Ctr, Roanoke, VA) **Humanistic behaviorism: A model for rapprochement in residential treatment milieus.** *Child Psychiatry & Human Development*, 1975(Sum), Vol 5(4), 254-259.—Discusses the combination of contrasting theoretical and methodological approaches employed by most residential treatment milieus. The medical model, with its emphasis on treatment planning growing naturally from categorical diagnostic thinking, is contrasted with the applied behavior analysis model with its proliferation of token economies, point systems, and behavior contracting. Judgmental errors flow naturally from the exclusive reliance on either model. Humanistic behaviorism provides a theoretical approach by proposing that techniques growing from each model can be complementary.—*Journal abstract.*

1156. Durand, Barbara. (U California, Nursing School, San Francisco) **A clinical nursing study: Failure to thrive in a child with Down's syndrome.** *Nursing Research*, 1975(Jul-Aug), Vol 24(4), 272-286.—Examined the impact of an individually tailored developmental nursing program on a 5-yr-old male with Down's syndrome and severe failure to thrive. Investigation of the child and his family suggested that the failure to thrive was the result of masked deprivation, and a study was designed to measure the effect of a 17-day program of developmental nursing care on specific parameters of growth and behavior: height, weight, amount of sleep, caloric intake, active mobility, awareness of the environment, prelanguage vocalizations, self-stimulation behavior, and play activity with toys. Data on these criteria were gathered before, during, and after the nursing care program. Findings support the assumptions that there would be an increase in height, weight, amount of sleep, active mobility, awareness of the environment, prelanguage vocalizations and a decrease in self-stimulation. Findings do not support the assumptions that there would be an increase in caloric intake and play activity with toys. The study supports the use of nursing care as the primary therapeutic modality for children with this condition and illustrates an approach to systematic evaluation of the effects of nursing care. (74 ref) —*Journal abstract.*

1157. Eisner, Donald A. (Albert Einstein Coll of Medicine, Yeshiva U) **Conservation ability of elderly men living in the community and an institution.** *Psychological Reports*, 1975(Aug), Vol 37(1), 333-334.—Assessed differences in decline of ability for logical operations for 10 elderly community residents (65-83 yrs old) and 2 elderly institutionalized groups, 10 with

moderate (64-91 yrs) and 10 with severe neurological deficits (78-90 yrs). While 100% conservation was shown by the community group on 2-dimensional space, number, substance, continuous quantity, weight, and discontinuous quantity, and 80% conservation of volume, the institutionalized Ss showed much lower rates. It is suggested that active elderly persons who reside in their own homes will not show the apparent decrement noted in earlier studies of institutionalized persons. The relationship between logical operations and fluid intelligence was supported by the diminished conservation performance of the institutionalized groups. Other sampling effects which might account for the differing results studies were age and length of institutionalization.

—*Journal abstract.*

1158. Flynn, Hulda R. & Henisz, Jerzy E. (Yale U. Medical School) **Criteria for psychiatric hospitalization: Experience with a checklist for chart review.** *American Journal of Psychiatry*, 1975(Aug), Vol 132(8), 847-850. —Describes the use of a 12-item checklist to score need for hospitalization. The checklist was filled in and scored by research assistants who reviewed the charts of 100 hospitalized and 50 nonhospitalized patients. A written opinion of a senior clinical consultant was available for hospitalized patients whose charts were rated low in need for hospitalization and for nonhospitalized patients whose charts were rated high. The checklist scores differentiated the 2 groups of patients. It is concluded that the checklist can be a valuable tool in a review process that culminates in review by an experienced clinician. (22 ref)—*Journal abstract.*

1159. Frank, Irving & Frank, Rosanne K. (Chicago Medical School, IL) **The management of adolescent crises in family practice.** *Adolescence*, 1975(Spring), Vol 10(37), 25-28. —Discusses the too often hasty and unwarranted hospitalization of young adolescents in the normative crises of adolescence. 2 case histories are presented.

1160. Goldstein, S.; Birnbaum, F. & Miller, B. (Royal Ottawa Hosp, Geriatric Services, Canada) **The team approach in a psychogeriatric unit.** *Journal of the American Geriatrics Society*, 1975(Aug), Vol 23(8), 370-375. —Recounts how the importance of a multidisciplinary team approach was recognized when a 14-bed short-term psychogeriatric unit was opened in a psychiatric hospital. The limited time available to the psychiatrist in charge placed a heavy clinical responsibility on the paramedical personnel who formed the team. 6 mo after the unit opened, all 12 staff members filled out a questionnaire. They felt that communication within the team was good, that they could fulfill the role of primary therapist, and that they understood their own roles and those of others. All regarded the psychiatrist as the head of the team. The psychiatrist felt that he had the ultimate responsibility for overall care of the patients, that any attempt to blur roles caused problems, and that there had been a partial regression to more traditional patterns. Members of the unit regarded themselves as a team, able to work together and pool skills in treating patients, and thus play a significant part in total care.

1161. Green, Phillip E. (C. F. Menninger Hosp., Topeka, KS) **Psychiatric nursing and the diagnostic**

process. *Journal of the National Association of Private Psychiatric Hospitals*, 1974(Sum), Vol 6(2), 19-26. —Presents a discussion of the use of psychiatric nursing notes —R. M. Cohen.

1162. Johnson, Esther et al. (VA Hosp, Brentwood, Los Angeles, CA) **Adopting new models for continuity of care: The ward as mini-mental-health-center.** *Hospital & Community Psychiatry*, 1975(Sep), Vol 26(9), 601-604. —Reports that several years ago the staff of a traditional psychiatric ward in a Veterans Administration hospital began trying to provide continual care for their former inpatients after they left the hospital. Nursing assistants conducted basic-skills groups and other groups in board-and-care homes; staff members made themselves available to former inpatients and their families, roommates, or board-and-care sponsors through a 24-hr telephone service and home visits; and a day-care program and follow-up groups for the ward's outpatients were set up. Later the staff established additional day-care and follow-up programs in a downtown satellite unit. In a recent 3-mo period, patients made a total of 4,488 visits to the satellite and hospital programs. A 2nd paper (see PA, Vol 55:1) discusses some of the theoretical considerations on which this program and other alternatives to traditional care is based.—*Journal abstract.*

1163. Kenney, Richard G. (Indiana U) **The prevalence of peonage in state supported total institutions for the mentally retarded.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1153-1154.

1164. Kentsmith, David K.; Menninger, W. Walter & Coyne, Lolafaye. (Nebraska Psychiatric Inst, Omaha) **A survey of state hospital admissions from an area served by a mental health center.** *Hospital & Community Psychiatry*, 1975(Sep), Vol 26(9), 593-596. —Reports results showing a significant decrease in the number of direct admissions to the hospital. However, the center consistently referred more patients with psychotic disorders to the state hospital than would be expected. Similarly, a high proportion of patients with organic brain syndromes were admitted directly to the hospital.

1165. Kirstein, Larry & Weissman, Myrna M. (Yale U. Medical School) **Utilization review of treatment for suicide attempters: Chart review as patient care evaluation.** *American Journal of Psychiatry*, 1975(Aug), Vol 132(8), 851-855. —Reviewed the charts of 36 16-55 yr old nonhospitalized suicide attempters who were identified by utilization review as requiring hospitalization. In 16 cases, the treatment given was judged to have been adequate because of an absence of a history of psychiatric treatment and/or the rapidity with which outpatient treatment was instituted. 10 cases were judged to have been inadequately treated. This finding suggests specific deficiencies in the training of residents and the delivery of psychiatric services and illustrates how chart review can be used to upgrade psychiatric care. (44 ref) —*Journal abstract.*

1166. Klonoff, Harry & Cox, Beverlee. (U British Columbia, Vancouver, Canada) **A problem-oriented system approach to analysis of treatment outcome.** *American Journal of Psychiatry*, 1975(Aug), Vol 132(8), 836-841. —Data on 90 psychiatric patients' perceptions of the course and outcome of hospitalization were gathered using a problem-oriented system. Patients were

interviewed on admission, at discharge, and at 2 follow-up intervals (1 wk and 3 mo). Therapists' perceptions of patients' problems and their severity were not assessed on patients' admission and at discharge. Although the absolute number of problems reported by patients increased over time, there was a significant decrease in the level of distress associated with problems on both patients' and therapists' ratings. The dynamics of this improvement are discussed from the perspectives of both patients and therapists.—*Journal abstract.*

1167. McLain, Richard E.; Silverstein, Arthur B.; Hubbell, Mimi & Brownlee, Linda. (Pacific Neuropsychiatric Inst Research Group, Pomona, CA) **The characterization of residential environments within a hospital for the mentally retarded.** *Mental Retardation*, 1975(Aug), Vol 13(4), 24-27.—Administered 2 questionnaires: Characteristics of the Treatment Environment (CTE) and the Residential Management Survey (RMS)—on 2 occasions to a total of 492 selected staff on wards within a hospital serving retarded patients. Results show that the CTE and the RMS differentiate not only among treatment programs with varying therapeutic goals but among wards within programs, as well, that the responses of the staff to the questionnaires are only minimally related to their demographic characteristics and employment history, and that the CTE and RMS mean scores for individual wards are relatively stable over time.—*Journal abstract.*

1168. O'Connor, Gail & Sitkei, E. George. (U Oregon, Rehabilitation Research & Training Ctr in Mental Retardation) **Study of a new frontier in community services: Residential facilities for the developmentally disabled.** *Mental Retardation*, 1975(Aug), Vol 13(4), 35-39.—Presents the findings of an extensive nationwide mailed survey of residential facilities for developmentally disabled persons. The purpose was to identify the population of community residences in order to involve their operators in a more detailed follow-up person-to-person interview. Information provided an initial profile of interrelationships between facilities, staff, and residents, and styles of resident life, services and programs, financial operations, and other major problems that have challenged those responsible for the operation of these facilities.—*Journal abstract.*

1169. Quadrio, A.; Castagna, P. C. & Strambio de Castilla, N. [Remarks about an experience of organization of a playing room in a pediatric hospital department.] (Ital) *Acta Medica Auxologica*, 1974, Vol 6(2), 117-129.—Examined the effect of guided play and the desirability of having a playroom in a pediatric hospital. Ss were 50 experimental Ss and 50 controls, 2-6 yrs old. Results suggest that those receiving guided play were less anxious, slept better, and showed fewer regressive behaviors than the control group. The importance of having therapeutically trained staff to guide the play of children in pediatric hospitals is emphasized.—R. V. Heckel.

1170. Singer, Judith E. & Grob, Mollie C. (McLean Hosp, Evaluative Services Unit, Boston, MA) **Patients discharged against medical advice: A follow-up study.** *Massachusetts Journal of Mental Health*, 1974(Fal), Vol 5(1), 57-67.—Conducted a follow-up study to compare 2 groups of patients discharged "against medical advice"

(AMA). 31 patients (Group 1) were discharged in 1973 and 46 (Group 2) were discharged in 1974, and the passage of a Massachusetts law restricting community commitment to mental hospitals. Either the former group had no recidivism or a relatively low rate of recidivism, the patient was discharged to a foster family, or received further treatment since discharge, and (c) the patient's reactions to hospitalization. A higher percentage of patients were discharged AMA after the new code took effect, and Group 2 included more patients under 21, more who had been in the hospital less than a month, and more who had shown no improvement at discharge. Both groups showed an unexpectedly high level of functioning at time of follow-up. Most patients in both groups had received some kind of psychiatric treatment since discharge. Significant differences between the groups are reported and discussed.—P. R. Sweet

1171. Slipp, Samuel. (New York U, Medical School) **The hospital without walls: An aftercare program for chronic schizophrenic patients.** *Group & Individual Group Dynamics & Psychotherapy*, 1974-75, Vol 6(1), 21-26.—Describes the Socialization Group Program at Bellevue Psychiatric Hospital designed to facilitate a reduction of new admissions to state hospitals of patients requiring long-term hospitalization. The program is used as a primary support group to provide emotional support, to reduce social isolation, and to help develop living and working skills is discussed.

1172. Strain, Phillip S. & Carr, Thomas H. (American U) **The observational study of social reciprocity: Implications for the mentally retarded.** *Mental Retardation*, 1975(Aug), Vol 13(4), 18-19.—Presents findings from a national survey of community residential facilities and placements for retarded persons. Data from 611 facilities on problem areas, funding, age and sex distributions of residents, staff recruitment and training, and services offered are presented. Results suggest that the community residential facilities movement, as an alternative to institutionalization, is gaining momentum and that these facilities provide opportunities for residents of varying ages and disability categories to participate in school, work, recreational, and other community activities. The need for cooperation between administrators, residents, and community citizens to establish more positive results is emphasized (16 ref).—Lynn Gorsey.

1173. Weiner, Oscar D. & Levine, Michael S. (Connecticut Mental Health Ctr, Utilization Review Committee, New Haven) **A process of establishing norms for inpatient length of stay in a community mental health center.** *American Journal of Psychiatry*, 1975, Aug, 842-846.—Considers that there is a need, stimulated by the Social Security Amendments of 1972 (Public Law 92-603), to establish norms for length of stay for inpatient services in mental health facilities and to provide review mechanisms for extended care cases. One such model is described, which is adaptable to changing needs and federal regulations, that can offer a beginning experience in this endeavor 2 case reports are presented to illustrate the procedure.—*Journal abstract.*

1174. Wolfe, Maxine. (Graduate School & University Ctr, City U New York) **Room size, group size, and density: Behavior patterns in a children's psychiatric**

facility. *Environment & Behavior*, 1975(Jun), Vol 7(2), 189-224. Presents findings from a 2-yr observational study conducted in a children's psychiatric facility. In that study, the use of bedrooms (particularly, the relationship between room size, group size, density) and predominant patterns of use and behavior were examined. Various combinations of room size (49.52, 118.05, and 220.99 sq ft) and group size (1, 2, 3, and 4 children) occurred naturally, yielded densities ranging from 29.01 sq ft child to 220.99 sq ft child. Findings indicate that potential density (i.e., sq ft person if all people are present), used in almost all architectural programming, was not related either to bedroom use or behavior patterns. Rather, room size and group size were significant, not as part of a mathematical density factor, but as they interacted to create certain psychological density conditions. Specific design and administrative implications of these findings are presented. (18 ref) *Journal abstract*.

1175. **Wolfer, John A. & Visintainer, Madelon A.** (Yale U, Nursing School) **Pediatric surgical patients' and parents' stress responses and adjustment as a function of psychologic preparation and stress-point care.** *Nursing Research*, 1975(Jul-Aug), Vol 24(4), 244-255. Tested the hypotheses (a) that children who receive systematic psychologic preparation and continued supportive care, in contrast to those who do not, would show less upset behavior and more cooperation in the hospital and fewer posthospital adjustment problems and (b) that their parents would be less anxious and more satisfied with information and care received. 50 male and 30 female 3-14 yr olds scheduled for minor surgery, and their parents, were randomly assigned to experimental and control conditions. The experimental intervention consisted of accurate information about sequences of events, sensory experiences, role expectations and appropriate responses, previews of procedures through play techniques, and supportive care given at critical points pre- and postoperatively. Significant differences between experimental and control children and parents on ratings of upset behavior, cooperation with procedures, pulse before and after painful procedures, resistance to induction, time to first voiding, posthospital adjustment, and parental anxiety and satisfaction with information and care consistently supported the hypotheses. Results are analyzed in relation to the age and sex of the children and whether parents roomed with the children. (36 ref)—*Journal abstract*.

1176. **Wolk, Robert L. & Reingold, Jacob.** (Eastern New York Correctional Facility, Mental Hygiene Unit, Bronx) **The course of life for old people.** *Journal of the American Geriatrics Society*, 1975(Aug), Vol 23(8), 376-379.—Evaluated 150 residents at a Hebrew home for the aged with regard to their past life in relation to institutional life. Various aspects of institutional living are discussed, particularly the imposition of a life-style completely foreign to their previous way of existence. It is concluded that old people who have been living in one manner for about 70 yrs cannot be expected to adjust readily to another rhythm. The clash of life-styles creates maladaptive behavior and adjustment problems that have not been adequately studied. Suggestions are made for approaches to resolve these difficulties, including

reprogramming of institutional living for old people so that they have an opportunity to maintain their customary life-style. Examples of such programming are presented.—*Journal abstract*.

Rehabilitation & Penology

1177. **Austin, Roy L.** (Pennsylvania State U) **Construct validity of I-level classification.** *Criminal Justice & Behavior*, 1975(Jun), Vol 2(2), 113-129. Presently, California's Community Treatment Project (CTP) may be granted its claim of relative success in rehabilitating "neurotic" male delinquents. But earlier, more extensive, success claims by CTP researchers have been questioned by outside researchers. The present findings provide a possible reason for the limited success of CTP. With the data from C. F. Jesness's (see PA, Vol 49:11410) Preston study, H. Costner's multiple indicator procedure (1969), and stepwise multiple regression, there is no evidence that competence in interpersonal relations and social maturity are important in interpersonal maturity level (I-level) classification. But intelligence and moral orientation explain substantial amounts of the variance in I-level. Findings are contrary to the emphasis in CTP and in I-level theory, the basis of CTP. (24 ref)—*Journal abstract*.

1178. **Borgman, Robert D.** (Family Mental Health Services, Hickory, NC) **Diversion of law violators to mental health facilities.** *Social Casework*, 1975(Jul), Vol 56(7), 418-426.—Studied 50 persons accused or convicted of criminal offenses who were diverted into mental health treatment. Effectiveness of mental health treatment in stopping law-violating behavior appeared to depend upon whether the offender habitually maintained employment and lived in a self-supporting family. Treatment in a mental health center in the community seemed more effective than in a state hospital.—*M. W. Linn*.

1179. **Chang, Dae H.; Zastrow, Charles H. & Blazicek, Donald L.** (U Wisconsin, Whitewater) **Inmates' perception of significant others, and the implications for the rehabilitation process.** *International Journal of Criminology & Penology*, 1975(Feb), Vol 3(1), 85-96. Investigated inmates' evaluative perceptions toward themselves and 12 other groups. Ss were 202 inmates of a large maximum security penitentiary in a midwestern state. A 5-point semantic differential scale was used as an instrument. Results show that inmates evaluated themselves quite highly, significantly higher than "people" in general. The 3 groups rated lowest were other prison inmates (most negatively), police officers, and security officers. Results confirm the hypothesis that inmates do not view themselves any more law violating than other people in general, and imply that in order for rehabilitation to occur, attitude changes must take place among the prisoners.—*S. S. Liu*.

1180. **D'Atri, David A.** (Yale U, Medical School) **Psychophysiological responses to crowding.** *Environment & Behavior*, 1975(Jun), Vol 7(2), 237-252. Attempted to replicate with humans the positive association between crowding and blood pressure found with nonhuman mammals. In the study, crowding was conceived as incorporating physical, social, and personal factors. Trained interviewers, using standardized (but

changing) questionnaires, collected data, including biographic, demographic and confinement history information, from the entire enumerated populations of 3 prisons (A, B, and C). Blood pressure and pulse rate were collected under "blind" conditions. Prisons were comparable in average length of inmate sentences. Results support the hypothesis using inmates in 2 housing modes: dormitories (7, 39, and 29 Ss in A, B, and C, respectively) and single occupancy cells (27, 52, and 97 Ss in A, B, and C, respectively). Within each prison, housing mode was related to systolic blood pressure. In 2 prisons, diastolic blood pressure and pulse rate were related to housing mode. Specifically, readings were higher for inmates in dormitories than in single occupancy cells. Methodological limitations of the study are discussed. (28 ref)—S. T. Margolis.

1181. Foster, Thomas W. (Ohio State U.) **Make-believe families: A response of women and girls to the deprivations of imprisonment.** *International Journal of Criminology & Penology*, 1975(Feb), Vol 3(1), 71-78. —Reviewed research data on the existence of complex patterns of pseudokinship relationships among inmates of female penal institutions. Comparison of data from 5 studies and 6 different institutions indicates that the total rate of active inmate participation in make-believe families may be quite large and is higher for the juvenile than the adult institutions. This may reflect a greater need of juveniles for family relationships. It seems that "familiying" has generally been tolerated in female correctional institutions either due to its pervasiveness or the difficulty in controlling. Some studies showed that family members were more apt to endorse an antiauthority inmate normative code than were other prisoners, but they were also more outgoing, more sociable, more group-oriented and more likely to participate in institutional treatment programs than nonmembers. The long-range effects of such "familiying" is, however, unknown.—S. S. Liu.

1182. Haley, Hugh L. (Canadian Penitentiary Service, Ottawa, Canada) **Social environment therapy: A treatment approach for correctional institutions.** *Canadian Journal of Criminology & Corrections*, 1974(Jul), Vol 16(3), 256-271.—Presents arguments which support changing social behaviors of delinquents instead of using the typical prison program of mere incarceration. A program that would use widely accepted behavioral principles to try to rehabilitate imprisoned offenders is outlined. In such a program, controlled environment would be created wherein the inmates' social behavior is monitored and modified when needed. Inmates and staff would work together to solve social problems and to help the inmates learn social skills and values. (French summary) (50 ref)—B. L. Kintz.

1183. Marholin, David; Plienis, Anthony J.; Harris, Suzanne D. & Marholin, Becky L. (U Illinois, Children's Research Ctr, Champaign) **Mobilization of the community through a behavioral approach: A school program for adjudicated females.** *Criminal Justice & Behavior*, 1975(Jun), Vol 2(2), 130-145. Describes Webster Hall, a community-based residential program for adjudicated adolescent females. A behavioral approach was employed in successfully demonstrating the systematic mobilization of various components of a community in order to

facilitate specific academic and social behavior change. Through a contingent feedback network including Webster Hall, the community public schools, the youths' guardians, and the community as a whole, it was possible to achieve desirable behavior necessary for effective community functioning. A descriptive functional analysis of elements of the community relative to individual behavior change is discussed (2 p ref)—*Journal abstract*

1184. Mitra, Sitamu S. (Pennsylvania State U, Systems & Operations Research) **Application of operations research methods to correctional problems.** *Criminal Justice & Behavior*, 1975(Jun), Vol 2(2), 169-179.—Discusses basic operations research techniques to build models for optimization problems and some of the difficulties encountered in applying these techniques to address correctional problems, and indicates some possible areas in the criminal justice system that can be explored using these methods. 4 different correctional projects that are currently being undertaken by the Pennsylvania Bureau of Correction are reviewed. Most of these projects use linear and integer linear programming methods.—*Journal abstract*

1185. Newnam, Raymond D. (U North Carolina, Disabilities Training Inst, Chapel Hill) **Personal polarity and placement problems: Reflexive rehabilitation vs unexamined closure.** *Journal of Rehabilitation*, 1973(Nov-Dec), Vol 39(6), 20-25.—Discusses the problems of rehabilitation and job placement in light of the counselor's personality as well as the S's. An analysis in dichotomies (seen as positives and negatives) of 3 primary characteristics in the psychological makeup of the individual charged with placement are presented: self-knowledge vs egocentricity, specific knowledge and logic vs ignorance, and energy vs lethargy. Guidelines for successful placement are summarized.—J. Carlson.

1186. Orford, Jim; Hawker, Ann & Nicholls, Peter. (Inst of Psychiatry, Addiction Research Unit, London, England) **An investigation of an alcoholism rehabilitation halfway house: I. Types of client and modes of discharge.** *British Journal of Addiction*, 1974(Sep), Vol 69(3), 213-224.—Interviewed each of 59 27-62 yr old male alcoholics admitted to a halfway house concerning the details of his social and drinking history. Analysis suggested that existence of 2 major dimensions of individual variation: degree of chronic alcohol dependence and late-uncomplicated vs early-complicated alcohol dependence. Observation of the lengths of residence and manners of discharge of members of the sample suggested 2 varieties of failure: premature discharge (length of stay less than 2 mo) and irregular discharge (drinking at discharge and/or discharge to an unknown or unsatisfactory destination). There was a significant tendency for early-complicated alcoholism to be associated with premature discharge. (26 ref)—*Journal abstract*.

1187. Ostrowska, Antonina. (Polska Akademia Nauk, Rome, Italy) **[Sociological conception of the rehabilitation process.]** (Polish) *Studia Socjologiczne*, 1974, Vol 4(55), 191-200.—Examines the rehabilitation process as seen by sociology and shows how the psychological aspect of rehabilitation can be integrated with sociological concepts.

1188. Scott, Joseph E. & Snider, Patricia J. (Ohio State U) **Perceptual effects of penal institutions on the severity of punishment.** *International Journal of Criminology & Penology*, 1975(Feb), Vol 3(1), 53-62.—Studies the relationship between the severity of punishment and the seriousness of crime by institution. Results confirm the hypothesis that the severity of punishment was in actuality a function of these perceptions and the stereotyping of the inmates on the basis of the prison in which they were serving their sentences.

1189. Sorensen, Darel F. (U Pacific) **The effects of using a cooperative group meeting system to improve socially relevant behaviors of delinquent boys.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1088.

1190. Sterescu, Lelia. (Newark-Beth Israel Medical Ctr, Dept of Physical Medicine & Rehabilitation, NJ) **A psychiatrist looks at a young branch of an old science.** *Journal of Rehabilitation*, 1973(Nov-Dec), Vol 39(6), 14-17.—Discusses the psychiatrist, the practitioner of physical medicine and rehabilitation. Physical medicine develops a program of individual rehabilitation in the context of the S's physical and mental condition, motivation, and potential. The wholistic healing approach of the psychiatrist is emphasized. Some specific areas of practice and problems are discussed.—J. Carlson.

1191. Thomas, Charles W. & Poole, Eric D. (Coll of William & Mary, Metropolitan Criminal Justice Ctr) **The consequences of incompatible goal structures in correctional settings.** *International Journal of Criminology & Penology*, 1975(Feb), Vol 3(1), 27-42.—Presents a theoretical model regarding the incompatible goal structures in a prison setting. While the explicit goal of a correctional setting is to stimulate the prosocial change of the inmate's behavior, the organizational structure is such that in striving to maximize the probability of achieving the control, it results in the alienation of organizational participants and appears to contribute directly to a process which may impair the organization's ability to attain either change or control goal.—S. S. Liu.

1192. Wada, Michael A & Brodwin, Martin. (Rancho Los Amigos Hosp, Downey, CA) **Attitudes of disabled individuals enrolled in a workstation center and a community college program.** *Journal of Employment Counseling*, 1975(Sep), Vol 12(3), 132-137.—Measured the attitudes of 50 disabled individuals toward the staff who gave them rehabilitation services. The attitudes of 2 groups of clients at a rehabilitation hospital were evaluated: (a) clients from a vocational rehabilitation workshop and (b) clients from a community college satellite program. Testing was performed at 3-wk intervals, using the Work Preparation Center Questionnaire and the College Instructor Rating of Client Form. It was found that clients in the community college program perceived their staff as having more concern than the workshop group. No relationship was found between attitudes and the length of time in the respective program. Clients who entered programs appeared to have attitudes that did not change to any great extent while they were in the rehabilitation program.—*Journal abstract*.

Drug & Alcohol Rehabilitation

1193. Adamson, John D.; Fostakowsky, Robert T. & Chebib, Farouk S. (U Manitoba, Winnipeg, Canada) **Measures associated with outcome on one year follow-up of male alcoholics.** *British Journal of Addiction*, 1974(Dec), Vol 69(4), 325-337.—Studied 52 male 22-73 yr old alcoholics who were either hospital inpatients or residents in a rehabilitation facility. Information was obtained regarding past and present social level and functioning and drinking history. Ss also completed a motivation checklist and an affect checklist. 38 Ss were successfully followed up 1 yr later; 13 were abstinent and 25 had resumed drinking. Of many life history variables, only level of education and residential stability were significantly associated with outcome. Measures of anomie derived from a principal component analysis of the motivation checklist were not significantly associated with outcome. However, a discriminant function, composed of variables from the motivation and affect checklists, completely separated the 2 outcome groups. When this function was applied to the Ss who were not followed up most were predicted to have returned to drinking. Results demonstrate that attitudinal measures are better predictors of outcome than are life history variables. (58 ref)—*Journal abstract*.

1194. Amini, Faribroz & Salasnek, Shell. (U California, Langley Porter Neuropsychiatric Inst, San Francisco) **Adolescent drug abuse: Search for a treatment model.** *Comprehensive Psychiatry*, 1975(Jul-Aug), Vol 16(4), 379-389.—Discusses the components of treating the adolescent drug abuser and attempts to put the idea of a "therapeutic community" within a theoretical framework for treating a specific population. The problems encountered in attempting to address the issue of adolescent drug abuse without a treatment model in mind are discussed, and guidelines are outlined for addressing these problems. Some of the problems of normal parenting of adolescents, providing a medium in which ego defects can be repaired, and providing a forum where internal psychological conflicts can be resolved are discussed. (18 ref)—*Journal summary*.

1195. Baker, T. B.; Udin, Harry & Vogler, Roger E. (U Utah) **The effects of videotaped modeling and self-confrontation on the drinking behavior of alcoholics.** *International Journal of the Addictions*, 1975(Oct), Vol 10(5), 779-793.—Assigned 30 male 25-55 yr old alcoholic inpatients to either behavior counseling, behavior counseling with videotape self-confrontation, or behavior counseling with role modeling treatment groups. Ss were then compared to 10 Ss receiving standard inpatient treatment. Immediate alteration of drinking topographies and posttreatment follow-up drinking dispositions served as dependent variables. Ss receiving videotape self-confrontation achieved greater positive changes in posttreatment drinking analysis sessions than did other treatment groups. Follow-up probes suggested the superiority of the experimental treatments in general, particularly videotape self-confrontation. Performance in the posttreatment analysis sessions was predictive of follow-up drinking status. (20 ref)—*Journal abstract*.

1196. Blackby, P. H. (U Oregon, Medical School, Portland) **Naloxone in opiate abstinence treatment**

programs. *Diseases of the Nervous System*, 1975(Apr). Vol 36(4), 223-224. Presents 4 case examples to illustrate the use of a short-acting narcotic antagonist devoid of agonist effects.

1197. Bourne, Peter G. (Drug Abuse Council, Washington, DC) **Non-pharmacological approaches to the treatment of drug abuse.** *American Journal of Chinese Medicine*, 1975(Jul), Vol 3(3), 235-244.—As a result largely of dissatisfaction with existing treatment methods for narcotic addiction, there has been considerable recent interest in various nonpharmacological approaches to treatment. Acupuncture, transcendental meditation, electrosleep, biofeedback, and hypnotism have generated interest and seem to be effective in a number of cases. Although apparently different, all of these approaches seek to induce a state of relaxation which in turn appears to exert specific neurophysiological changes in the brain. These treatment methods not only provide help for some addicts, but contribute to our overall understanding of the addiction process. (23 ref)

Journal abstract.

1198. Copemann, Chester D. & Shaw, Paula L. (State U New York, Stony Brook) **The effect of therapeutic intervention on the assessment scores of narcotic addicts.** *International Journal of the Addictions*, 1975(Oct), Vol 10(5), 921-926.—Administered the WISC, Lazarus's Assertiveness Questionnaire, and the Eysenck Personality Inventory to 6 male and 8 female (mean age, 22.5 yrs) Black narcotics addicts in a behaviorally oriented halfway house. Pre- and posttreatment scores were compared. Results show that there were significant increases in WISC Full Scale, Verbal, and Performance IQs. A significant increase in assertiveness was also observed. There were no changes in extraversion or neuroticism. Results support previous studies of psychological test performance of addicts and suggest that at the time of addiction, drug users may not be functioning at their full intellectual capacities.—L. Gorsev.

1199. Costello, Raymond M. (U Texas, Health Science Ctr, San Antonio) **Alcoholism treatment and evaluation: In search of methods. II. Collation of two-year follow-up studies.** *International Journal of the Addictions*, 1975(Oct), Vol 10(5), 857-867. Summarizes 23 articles reporting outcomes of alcoholism treatment efforts over a 2-yr follow-up period. Broad conclusions reached by the author in a previous report (1975) of 1-yr follow-ups were supported. Similar consistencies were noted across studies within groups described as having good outcome profiles. Good outcome resulted from matching relatively better prognostic cases with programs with broad treatment resources. Multiple baselines are offered as guidelines for program evaluation and were generated by a hierarchical grouping of outcome profiles. (26 ref)

Journal summary.

1200. Feinstein, Beverly & Hanley, John. (VA Hosp, Sepulveda, CA) **EEG findings in heroin addicts during induction and maintenance on methadone.** *Electroencephalography & Clinical Neurophysiology*, 1975(Jul), Vol 36(1), 96-99. Investigated changes in the EEG of 5 18-40 yr old addicts initially on heroin as they progressed through the induction and maintenance phases of a methadone program. Spectral analysis of

bipolar recordings revealed significant consistent differences only in the eyes-closed resting state. (French summary)

1201. Hoffmann, Helmut & Noem, Avis A. (Willmar State Hosp, MN) **Sex differences in a state hospital population of alcoholics on admission and treatment variables.** *Psychological Reports*, 1975(Aug), Vol 37(1), 145-146.—Compared 2,077 males and 194 females admitted to an alcohol treatment unit of a state hospital over a 3-yr period. Female alcoholics showed a significantly higher percentage than male alcoholics of 1st admissions (46% vs 36%), voluntary referral status (58% vs 48%), married status (55% vs 47%), younger age of 25-44 yrs (46% vs 33%), and high school education (68% vs 43%). Sex differences for treatment variables (e.g., completion of program, length of stay, and prognosis) were small. Significantly more females than males were referred to community mental health centers (17% vs 9%) and clergy (8% vs 4%) and less often referred to employers (9% vs 18%) and law enforcement agencies (0% vs 5%). The sex differences might reflect societal norms and circumstances.—*Journal abstract.*

1202. Kingstone, E. & Kline, S. A. (U Toronto, Sunnybrook Medical Ctr, Canada) **Disulfiram implants in the treatment of alcoholism: Some mechanisms of action.** *International Pharmacopsychiatry*, 1975, Vol 10(3), 183-191.—For nearly 20 yrs, disulfiram implanted subcutaneously has been used in alcoholics who have failed to respond to other treatment. Significantly positive results have been reported in a large number of cases. Despite this extensive use, many questions remain as to how these effects are exerted. Based in part on the author's recent series of cases, the following explanations are offered regarding the possible mechanisms of action: (a) high motivation to stop drinking, manifested by agreeing to the procedure and reinforced by the procedure; (b) palpable presence of the drug in the site of implantation; (c) generally sufficient reactivity of the agent to indicate activity to the patient; and (d) in obsessional patients, a removal of the fear of resumption of drinking for an extended period of time. For the more sociopathic patients the implant appears to provide a more structured ego boundary to allow the patient to change.—*Journal abstract.*

1203. Kooyman, Martien. (Erasmus U, Rotterdam, Netherlands) **From chaos to a structured therapeutic community: Treatment programme on Emiliehoeve, a farm for young addicts.** *Bulletin on Narcotics*, 1975(Jan-Mar), Vol 27(1), 19-26.—Traces the 2½-yr history of a drug-free community for young addicts (mean age 23) on a farm which provides a variety of work situations. The building's capacity of 10 has recently been increased to 20. In all, 64 addicts have been admitted. The 5 stages of the program are described, including approaches that proved ineffective and were discarded. The present structure includes a work program, discipline of residents by themselves, encounter group therapy, special advisors on agriculture and the arts, and sports and cultural activities. Criteria for rehabilitation must be met, and preventive measures involve the community in several ways. A halfway house facilitates re-entry. Detoxification procedures make no

use of drugs or medicines. A follow-up study of all residents is in progress.—A. S. Kulkarni.

1204. Kurland, Albert A.; McCabe, Lee & Hanlon, Thomas E. (Maryland Dept of Health & Mental Hygiene, Psychiatric Research Ctr, Baltimore) **Contingent naloxone (N-allylnoroxymorphone) treatment of the paroled narcotic addict.** *International Pharmacopsychiatry*, 1975, Vol 10(3), 157-168.—Presents results of pilot and controlled research on the effectiveness of the contingent (upon narcotic drug use) administration of 500-2,000 mg daily of naloxone to paroled narcotic addicts enrolled in a urine monitoring program conducted in a metropolitan-based outpatient clinic. Criteria of effectiveness, which included clinic attendance, the extent of narcotic drug usage, and final disposition at the end of a 6-mo treatment period, were viewed in relation to already established baseline results with a sample of patients processed through the same clinic over a 5-yr period prior to the introduction of naloxone treatment. Although results of the pilot study are encouraging, indicating longer patient involvement and less reinstitutionalization than baseline values, results of the controlled evaluation reveal no benefit from contingently administered naloxone beyond placebo reactivity, which appears to be substantial in the contingent approach. (15 ref)—*Journal abstract*.

1205. Levine, Richard J. & Kabat, Hugh F. (U Minnesota, Pharmacy Coll) **A client-developed methadone maintenance program.** *International Journal of the Addictions*, 1975(Oct), Vol 10(5), 825-842.—Describes the rationale, goals, programs, and evaluation procedures of a methadone maintenance program which is jointly administered by the clients and the professional staff. Roles of the counselors, pharmacists, and clients are discussed, and evaluative data from the initial client sample are presented. (19 ef)

1206. Mintz, Jim; O'Brien, Charles P.; O'Hare, Kate & Goldschmidt, Jean. (VA Hosp, Drug Dependence Treatment Ctr, Philadelphia, PA) **Double-blind detoxification of methadone maintenance patients.** *International Journal of the Addictions*, 1975(Oct), Vol 10(5), 815-824.—Assigned 24 22-47 yr old methadone maintenance patients to either a decreasing dose or continued methadone maintenance, matching for dose, initial complaint levels, and counselor. After 14 wks most patients in both groups had terminated from the study. Detoxifying patients usually terminated by obtaining a dose increase or dropping out; maintenance patients usually terminated for external reasons. Prior to terminating, detoxifying patients reported increased withdrawal complaints but no awareness doses had decreased. Termination was not directly related to dose level or percentage decrease. In both groups, terminators were likely to have been high in complaints during the baseline period.—*Journal summary*.

1207. Moss, David M. (Lutheran General Hosp, Community Pastoral Counseling & Consultation Ctr, Park Ridge, IL) **Parochial ministry, the Episcopal Church, and alcoholism.** *Journal of Religion & Health*, 1975(Jul), Vol 14(3), 192-197.—Investigated stated indifference to alcoholism treatment in a Chicago parish and the effects of 5 clergy-training methods on 100 priests over a 3-yr period. It is concluded that clergy attend

more to problems-in-living and that inattentiveness, resistance, and naivete prevailed when alcoholism problems confronted the priests.

1208. Woolf, V. Vernon. (Brigham Young U) **The relationship between peer involvement in a drug rehabilitation group and judgments of moral maturity on the Kohlberg moral maturity stages.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1388.

PROFESSIONAL PERSONNEL AND PROFESSIONAL ISSUES

1209. Abou-Rass, Marwan. (U Pittsburgh) **Effects of method of sequencing and amount of training on the acquisition and performance of psychomotor skills in preclinical endodontics.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 60.

1210. Almos, Kermit O. (Purdue U) **Structured client feedback as a practicum training device.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 127-128.

1211. Carter, Dianne K. (U Utah) **A comparison of two treatments for the reduction of counselor anxiety.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 612.

1212. Fisher, Seymour & Bender, Susan K. (Boston U, Medical School, Research Training Program) **A program of research training in psychiatry: Ten-year evaluation and follow-up.** *American Journal of Psychiatry*, 1975(Aug), Vol 132(8), 821-824.—19 psychiatrists who participated in the research training program at Boston University School of Medicine from July 1962 to June 1972 were surveyed by questionnaire to determine how participation in the training program may have affected their subsequent professional careers. 13 completed the program and 6 did not. Results indicate that—probably via a combination of self-selection, screening, and the actual experience of research training—these 19 psychiatrists constitute an impressive group who are active in research, publish extensively, and assume substantial teaching responsibilities at medical schools. It is suggested that a postresidency program in research training can be extremely important to the development of careers in psychiatric research and to a more scientifically grounded profession.—*Journal abstract*.

1213. Golden, Janet M. (Catholic U of America) **Scores on admissions tools used by the National Catholic School of Social Service for the academic years 1969, 1970, and 1971 in relation to first-year students' differential performances in major sequence areas in the master's degree program.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1362-1363.

1214. Graden, Hank; Lips, Rosemary & Mitchell, Kenneth. (North Carolina Div of Vocational Rehabilitation, Raleigh) **The campus scene: Attendants trained to aid handicapped students.** *Journal of Rehabilitation*, 1973(Nov-Dec), Vol 39(6), 11-13.—Discusses the selection and training of attendants to aid the handicapped student. Nursing, medical, and psychological training are included in the program.

1215. Heidel, Stephen et al. **Medical student assessment of videocassettes in psychiatry.** *Journal of Medical Education*, 1975(Sep), Vol 50(9), 908-910.—5

4th-yr computer-assisted students independently critiqued the 11 20-54 min videocassettes included in *The Electronic Textbook of Psychiatry and Neurology*. Excerpts from the evaluations are presented, and the advantages and limitations of the cassettes are noted.

1216. Hilberman, Elaine et al. (U North Carolina Medical School, Chapel Hill) **Support groups for women in medical school: A first-year program.** *Journal of Medical Education*, 1975(Sep), Vol 50(9), 867-875.—Describes a model for a support system for 1st-yr female medical students. The students met in small groups at weekly intervals with women faculty members from the department of psychiatry throughout the academic year. Role conflicts which confront these young women professionals entering a "masculine" field as a minority group are described. Those factors, both personal and institutional, which serve either to promote or deter conflict resolution and the acquisition of a satisfactory professional and female identity are detailed. A discussion of group formation and processes and a year-end evaluation are included. Both students and faculty assessed the program as having provided a needed and constructive setting in which to explore the problems and identities of women professionals and to develop close supportive relationships with women colleagues.—*Journal abstract*.

1217. Ivy, Thomas T. (Arizona State U) **An integrated approach to counseling practicum.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1081-1082.

1218. Iwashita, Harold T. (Northern Illinois U) **Relationships between Machiavellianism, I-E control and counseling orientation at three levels of counselor training experience.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1082.

1219. Kane, Robert L. & Olsen, Donna M. (U Utah, Medical Coll) **Attitude change among Medex and medical students.** *Journal of Medical Education*, 1975(Sep), Vol 50(9), 895-897.—Compared attitude changes after training in 37 physician's assistants (Medex) and 47 medical students. Results from 3 testings show that (a) Medex Ss were initially more concerned about their status; (b) the medical students were significantly more humanitarian, although the former showed decreasing scores and the latter increasing scores; and (c) at the 3rd testing, medical students were significantly more anxious than the Medex students.

1220. Kaufert, Joseph; Martinez, Cervando & Quesada, Gustavo. (St Thomas' Hosp & Medical School, Social Medicine & Health Service Research Unit, London, England) **A preliminary study of Mexican-American medical students.** *Journal of Medical Education*, 1975(Sep), Vol 50(9), 856-866.—Reports results of a 1973 mail questionnaire survey of 230 Chicano medical students. Data from 114 respondents indicate that this group of medical students is similar to the majority of medical students in some respects but diverges widely in other areas (e.g., parental socioeconomic status and language use). Differences in ethnic identification within the group were also found. California and Texas are educating the majority of the Chicano students surveyed.—*Journal abstract*.

1221. Lechnyr, Ronald J. (U Utah) **Powerlessness, self-esteem, and empathy: A study of the impact of**

training on Indian paraprofessionals. *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1365.

1222. Tennon, William J. (U Penn) **A study of the effects of counseling practicum supervisor offered facilitative conditions on supervisee self-exploration.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 136-137.

1223. Martin, James G. (Pacific U) **Counselor need patterns, life history antecedents, and counselor effectiveness.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(1-A), 137-138.

1224. McLean, Peter D. & Miles, James E. (U British Columbia, Vancouver, Canada) **Training family physicians in psychosocial care: An analysis of a program failure.** *Journal of Medical Education*, 1978(Sep), Vol 53(9), 900-902.—Investigated the feasibility of training family physicians in a time limited and structured program for the psychosocial treatment of clinical depression. Of 35 participants, only 2 completed therapy on 1 patient couple, and 19 of the 21 who used the program at all did not actually follow it. Findings suggest that the Ss experienced inordinate problems in structuring and controlling the outcome of the interpersonal encounters and were unwilling to collect even the most simple data on patient progress.

1225. O'Brien, Arthur S. (U Pittsburgh) **A study in inter-professional cooperation involving the mental health profession and the Roman Catholic clergy.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 174-175.

1226. Persons, William E. (U Florida) **Occupational prediction as a function of the counselor's racial and sexual bias.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 139-140.

1227. Plovnick, Mark S. (Massachusetts Inst of Technology, Sloan School of Management, Cambridge) **Primary care career choices and medical student learning styles.** *Journal of Medical Education*, 1975(Sep), Vol 50(9), 849-855.—Studied the influence of medical students' learning styles (i.e., how they prefer to receive and use information in learning and problem-solving situations) on (a) their choice of medical career type and (b) their sources of information and influence in making that choice. Ss were 64 seniors and 72 freshmen in a large eastern medical school; another group of 27 seniors were interviewed about their career choices. The Learning Styles Inventory was specially developed for the study. Results suggest that Ss with learning styles that are associated with primary care careers are also dissatisfied with a traditional basic science curriculum and are influenced more than the average student by concrete work experiences, as well as identification with role models, in making a career decision. The possibility that more students might consider primary care careers if more primary care experiences and role models were available in medical school is discussed.—*Journal abstract*.

1228. Reid, Fred W. (U North Carolina, Chapel Hill) **An evaluation of the impact of clinical pastoral education upon the personality of the minister.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 182-183.

1229. Sadock, Virginia A.; Sadock, Benjamin J. & Kaplan, Harold I. (New York Medical Coll, NY) **Comprehensive sex therapy training: A new approach.** *American Journal of Psychiatry*, 1975(Aug), Vol 132(8), 858-860.—Describes a 2-yr part-time sex therapy training program for physicians. The 1st yr emphasizes instruction in human sexuality as it relates to dysfunctional states. A highly selected group continues to a year of clinical experience using dual-sex (trainee-supervisor) therapy teams; trainees treat an average of 4 dysfunctional couples. It is suggested that the program can serve as a possible model for other centers.—*Journal abstract*.

1230. Santisteban, A. Joseph. (Boston U, Sargent Coll of Applied Health Professions) **The use of psychological models in medical education.** *Journal of Medical Education*, 1975(Jun), Vol 50(6), 636-637.—Notes the need to develop teaching strategies and materials accurately depicting the patient-physician interaction. The use of videotapes and audiotapes to provide interview models for medical students is discussed.

1231. Stone, Michael H. (New York State Psychiatric Inst, NY) **Management of unethical behavior in a psychiatric hospital staff.** *American Journal of Psychotherapy*, 1975(Jul), Vol 29(3), 391-401.—Discusses 5 related cases of unethical conduct by mental health professionals at the same psychiatric hospital; most cases involved sexual relations between staff members and patients. These incidents illustrate the need to re-emphasize the importance of medical-psychiatric canons of professionals conduct. It is noted that some currently popular movements in psychotherapy advocate the same behavior toward patients that traditional psychiatry forbids. The effect of ethical breaches upon psychotherapy is discussed and suggestions for appropriate administrative measures in dealing with such incidents are outlined. (18 ref)—*Journal summary*.

1232. Stritter, Frank T.; Hain, Jack D. & Grimes, David A. (U North Carolina, Medical School, Chapel Hill) **Clinical teaching reexamined.** *Journal of Medical Education*, 1975(Sep), Vol 50(9), 876-882.—Determined the most effective clinical teaching behaviors of clinical teachers or preceptors in individual or small group settings. An instrument was developed to survey all clinical medical students at 2 state universities ($N = 265$). This process resulted in a compilation of the specific behaviors found to be most helpful to the responding students in facilitating their clinical learning. All items were then factor analyzed, resulting in 6 more general teaching dimensions or factors: active student participation, preceptor attitude toward teaching, emphasis on applied problem-solving, a student-centered instructional strategy, humanistic orientation, and emphasis on content and research. The more specific behaviors which loaded on each factor are examined.—*Journal abstract*.

(Michigan State U) **An experimental study investigating the effects of real and simulated clinical training on psychomotor, affective and cognitive variables during real clinical performance of first year osteopathic medical students.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1089-1090.

1236. Ward, Nicholas G. & Stein, Leonard. (U Washington, Seattle) **Reducing emotional distance: A new method to teach interviewing skills.** *Journal of Medical Education*, 1975(Jun), Vol 50(6), 605-614.—Based on a review of the literature on the teaching of interviewing to medical students and psychiatry residents, it is concluded that too much teaching emphasis has been given to the content of the interview and not enough to the process of the interview. A new method to teach interviewing skills to residents in psychiatry is described. The method focuses entirely on the interpersonal aspects of the interview. Within a seminar format, each resident attempts to reduce the "emotional distance" between himself and a patient. Much consideration is given to the individual emotional style of the resident. Through practice with this method and with peer and staff feedback, each of 8 residents who was studied improved in this ability, gained much affectual information from the patient, and learned many of the subtle aspects of process that are necessary for good interviewing and good psychotherapy. (21 ref)—*Journal abstract*.

1237. Weinstock, Sheldon D. (Catholic U of America) **An investigation of the level of functioning of mental health associates in counseling functions.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1090.

1240. Woodard, Wallace S.; Burck, Harman D. & Sweeney, Patrick. (Florida State U) **Counselor's evaluation of Rogers-Perls-Ellis's relationship skills.** *Journal of Employment Counseling*, 1975(Sep), Vol 12(3), 108-111.—22 participants (12 employment counselors and 10 counselor supervisors) attended a 3-wk workshop on enhancing relationship skills, after which each participant evaluated the C. Rogers, F. Perls, and A. Ellis film, *Three Approaches to Psychotherapy*, on 15 skills. Results indicate that there was general agreement between the counselors and the supervisors when judging levels of therapist functioning by the relationship skills. However, they also show that within each group there was wide divergence of judgment. Neither counselors nor supervisors agreed among themselves on their evaluation of the relationship skills of Rogers, Ellis, and Perls. Implications are drawn for the use of the film as a training-evaluation aid for employment counselors and supervisors.—*Journal abstract*.

EDUCATIONAL PSYCHOLOGY

1245. McCarty, C. A. (U Toronto, School of Physical & Health Education, Canada) Patterns of learning projects among professional men. *Alberta Journal of Educational Research*, 1975(Jun), Vol 21(2), 116-129. —Investigated the extent and characteristics of adult learning activities among 54 30-50 yr old professional men (e.g., lawyers, engineers, doctors, and architects) with incomes of at least \$12,000. Learning participation was defined as engaging in a learning project of at least 7 hrs' duration during a 6-mo period that consisted of a series of learning episodes devoted to planning, preparing, or traveling and which culminated in a sustained and deliberate effort. Intensive interviews were conducted with all Ss. Results show that 54 Ss had participated in a total of 599 projects in a 12-mo period, an average of 11.1 projects for each S. No S had not participated in any learning project. Most of the learning projects concerned vocational activities (e.g., career-related or advanced technical education), followed by hobbies and recreational activities. Self-planned activities were most common. Implications for educational design and research are examined. (15 ref)—L. Gorsey.

Educational Administration & Personnel & Training

1253. Andrulis, Dennis P.; Iscoe, Ira; Sikes, Melvin P. & Friedman, Thomas. (U Texas, Austin) Black professionals in predominantly White institutions of higher education: An examination of some demographic and mobility characteristics. *Journal of Negro Education*, 1975(Win), Vol 44(1), 6-11.—Analyzes responses to a questionnaire by 405 male and 154 female Black Americans hired as faculty or administrators by predominantly White higher-education institutions. 24% were born in the South, but only 8% currently worked there; 45% were employed in the central and midwestern areas. There is a clear trend toward more employment of Blacks in larger educational institutions. 43% were in positions related to education and social science. Approximately 2/3 of the respondents were less than 40 yrs old. The median salary for 9 mo was \$12,000. 137 males and 37 females held PhDs. The implications of

these and other findings as indications of the current and changing status of Black educators are discussed.—*B. M. Anthony.*

1254. Arikado, Marjorie S. (Ontario Inst for Studies in Education, Toronto, Canada) **Status consensus as it relates to team teacher satisfaction.** *Alberta Journal of Educational Research*, 1975(Jun), Vol 21(2), 104-109.—Examined the relationship between the variable status consensus and team teacher satisfaction using 134 teacher teams in 71 open schools. 2 operational definitions of status consensus were tested. A significant relationship was found between competence of a formal team leader as perceived by team members, and their satisfaction with the team teaching situation; however, the degree of team agreement on the highest ranking team member (in terms of leadership qualities) was not significantly related to team satisfaction. Problems with H.P. Shelley's (1960) operational definition of status consensus (i.e., the degree of team agreement on the assignment of a team member to the highest rank) are examined.—*Journal abstract.*

1267. DeVries, David L. (Johns Hopkins U, Ctr Social Organization of Schools) **The relationship of role expectations to faculty behavior.** *Research in Higher Education*, 1975, Vol 3(2), 111-129.—Used records and questionnaires to examine sources of influence over 290 faculty members of a large public university. It was found that the role expectations faculty members had for themselves and the role expectations of the employing organization both predicted positively and significantly the role behaviors of the respondents. The departmental colleagues' expectations predicted significantly role behaviors for the research role only. In addition, the degree of person-role conflict a faculty member was exposed to was related to his productivity (research) but not to his satisfaction. Implications of the results are explored for both role theory and for the understanding of faculty behavior. (38 ref)—*Journal abstract.*

1273. Friesen, D. (U Alberta, Edmonton (Canada)) A study of a public school system, Hessen, West Germany. *Alberta Journal of Educational Research*, 1975(Jun), Vol 21(2), 84-103. Reports findings on the organization and administration of public education in Hessen, West Germany. The data, collected during a 4-mo period, resulted from visits to schools, interviews, and examination of documents. The positive characteristics of public education in Hessen include the strong academic basis, the early writing and reading programs, the emphasis on excellence, the pragmatic vocational programs, and the development of responsibility among students. The organization and administration of public schools and proposed changes in these areas are also examined. The historical background of public education in Germany is reviewed, and current educational structures in Hessen are described. A more detailed analysis of the administrative structures in the West German state is presented. Educational reform in Germany, both in terms of objectives of the reform and in difficulties encountered in the realization of desired changes is discussed. (24 ref) —*Journal abstract.*

1278. Goebes, Diane D. & Shore, Milton F. (Catholic U of America) Behavioral expectations of students as related to the sex of the teacher. *Psychology in the Schools*, 1975(Apr), Vol 12(2), 222-224.—Studied whether or not teacher expectations of male and female students were related to the sex of the teacher. Ss were 72 teachers 22-57 yrs old. Each teacher was administered a semantic differential scale consisting of 12 bipolar adjectives. The distances between the "ideal student" and the "typical boy" and "typical girl" were tested for significance. Female teachers viewed the behavior of girls as significantly closer to that of the ideal student than did the male teachers.—*H. Kaczkowski.*

1293. Lamb, F. C. Limitations of personality testing as applied to college of education students. *Educational Research*, 1974(Nov), Vol 17(1), 34-40.—112 female and 32 male teacher education students completed the British version of the Study of Values and the Minnesota Teacher Attitude Inventory (MTAI) at the beginning and end of their course of study, a period of 2½ yrs. Scores for the Study of Values did not change significantly for either men or women during this period. Women scored higher than men in child-centeredness as measured by the MTAI, and the difference increased during the course. On the whole, the results fail to show that either test is a useful yardstick in selecting students for teacher training.—*Journal summary*.

1294. Lauglo, Jon. (U London, Inst of Education, England) Teachers' social origins, career commitment during university, and occupational attitudes. *Sociology of Education*, 1975(Sum), Vol 48(3), 287-307.—Analyzes the responses of 1,153 Norwegian academic secondary school teachers to a questionnaire about their social origins, about the extent to which they developed a commitment to a career in teaching while at the university, and about various aspects of their professional attitudes. Individuals of lower social origins were slightly more prone to develop an early commitment to teaching. Social origin and the strength of pedagogical commitment during university were not important determinants of Ss' occupational attitudes. Findings do not show clearly distinguishable constellations or types of attitudes among academic secondary school teachers in Norway. (24 ref)—*Journal abstract*.

1326. Whealon, Terry O. (Indiana U) **A study of personality characteristics and personal background of teachers in Title One schools.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 521-522.

Curriculum & Programs & Teaching Methods

1327. Ankenbrand, Larry J. (U Missouri, Columbia) **The self concept of students physically handicapped and nonhandicapped related to participation in an individual sport.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1115.

1328. Ball, Linda V. (U Connecticut) **Student contracting for achievement grades in ninth grade general mathematics.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 206.

1329. Banks, Samuel L. (Baltimore City Public Schools, Workshop for Teachers & Administrators on a Multiethnic Social Studies Curriculum, MD) **Blacks in a multiethnic social studies curriculum: A critical assessment.** *Journal of Negro Education*, 1975(Win), Vol 44(1), 82-89.—Discusses the negative effect on the self-concept of Black children of the continuing neglect of Black history and culture in multi-ethnic curricula. It is argued that textbooks convey fallacious images. Curriculum guides suggest that Black history is separate from American history. Schools and colleges do not seriously consider the culture and history of Blacks. It is proposed that administrators, curriculum workers, the mass media, and teachers attempt to correct fallacies related to identity problems of Blacks. Essentials for a multi-ethnic curriculum are (a) sensitization and training of various personnel with respect to minorities, (b) multi-ethnic materials, (c) biracial staffs, and (d) cooperation between the school and the entire community.—B. M. Anthony.

1330. Berve, P. Criteria for the assessment of pupils' compositions. *Educational Research*, 1974(Nov), Vol 17(1), 54-61.—Compared the performance of 10-11 yr olds on an imaginary writing task stimulated (a) by a taped dialogue and (b) by the customary written title. 233 Ss were randomly assigned to treatment (aural stimulus) and control (written title) groups and tested for the quality and content of their writing. A 4-way analysis of variance showed no main effect of Treatment, Sex, School, or Reading Ability, but girls appeared generally more proficient than boys, and boys of lower ability seemed to benefit more from the taped stimulus than boys of higher ability.—J. B. Francis.
1331. Bieniewski, Anne M. (U Illinois, Champaign-Urbana) The effects of a student-centered self development course on self actualization as measured by the personal orientation inventory. *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 576.
1332. Bluth, Linda F. (U Illinois, Urbana-Champaign) A comparison of the reading comprehension of good and poor readers in the second grade with and without illustration. *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 637.
1333. Boyd, Alvin L. (U Illinois, Urbana-Champaign) Computer aided mathematics instruction for low-achieving students. *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 553.
1334. Bradfield, Robert H. et al. (California State U, San Francisco) Project B.E.A.M.: An experiment in intervention. *Journal of Negro Education*, 1975(Win), Vol 44(1), 34-41.—Describes an intervention program used to improve the academic and social behavior of delinquent and predelinquent Black adolescents in Grades 7 and 8 of a ghetto junior high school. The program included a tutorial reading program, biweekly group counseling, and cultural enrichment. TOTE (a performance-demonstrated instructional management system) and cash-redeemable tokens were used to facilitate reading progress. Cash was given for attendance at the group counseling sessions, led by more advanced Black students. Change in reading scores (measured by the Gilmore Oral Reading Test), teacher evaluations, and change in probationary status suggest that appropriate intervention programs can solve problem behavior.—B. M. Anthony.
1335. Braxton, Loretta M. (U Virginia) The effects of instruction in sentential logic on the growth of the logical thinking abilities of junior high school students. *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 657-658.
1336. Breiter, Joan C. (Iowa State U) Reading or listening: A comparison of techniques of instruction in elementary social studies. *Alberta Journal of Educational Research*, 1975(Jun), Vol 21(2), 130-140.—Examined the relative value of reading and listening as techniques of instruction to facilitate comprehension of social studies material. 570 6th graders, grouped by intelligence level, reading ability, and sex, read or listened to identical material drawn from commercial supplementary unit texts and were tested on their comprehension of this material. Data indicate that the comprehension of Ss of high intelligence, Ss with high or below average reading ability, and girls was significantly better when reading than when listening on at least 1 of the 2 units, though neither technique facilitated a significant difference in the comprehension of all 6th grade Ss.—*Journal abstract*
1337. Burgess, Margaret H. (Florida State U) The effectiveness of a linguistically-based decoding program used on a card-reading machine with disadvantaged elementary children. *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 659.

1340. Carnoy, Martin & Levin, Henry M. (Stanford U) Evaluation of educational media: Some issues. *Instructional Science*, 1975(Oct), Vol 4(3-4), 385-406.—Examines some of the biases in 6 selected studies on the uses, costs, and effectiveness of educational media (educational radio and TV, computer-assisted instruction, and videotape instructional systems). (27 ref)
1341. Casteel, J. Doyle. (U Florida, Coll of Education) A verbal approach to value clarification: An introduction. *Behavioral & Social Science Teacher*, 1974(Fal), Vol 2(1), 35-39.—Describes an approach to value clarification that enables teachers to play, teach, and assess learning according to student performance. A 4-phase model of value clarification is presented stressing comprehension, relations, valuation, and reflection. The use of value sheets to elicit value clarification patterns of language from students is described. 6 value-sheet formats are noted, and an example using interrogative modes given.—R. Tomasko.
1342. Cooper, Shirley. (Mt Zion Hosp & Medical Ctr, San Francisco, CA) Hold the hardware: The use and abuse of tapes in clinical teaching and learning. *American Journal of Orthopsychiatry*, 1975(Jul), Vol 45(4), 573-579.—Discusses the virtues and limits of tape recording in clinical learning and indicates that tapes can be valuable teaching aids when used properly but detrimental to learning when used uncritically. Appropriate client selection, teaching to develop good clinical memory, the need to differentiate verbalized assent from true consent, and related issues are examined and illustrated.—*Journal abstract*.
1343. Dansereau, Donald F. et al. (Texas Christian U, Inst for the Study of Cognitive Systems) Learning strategy training program: Visual imagery for effective learning. *US AFHRL Technical Report*, 1975(Jun), No 75-47, 199 p.—Describes an effective integrated learning strategy program emphasizing a connection technique using visual imagery. The components were derived from a review of the educational and psychological literature and from an analysis of the responses to a learning strategy inventory. Also, 2 other training packages (paraphrasing and question-answer connection) were evaluated along with this package in a controlled experiment. This program improved long-term retention of factual material and appeared to help lower reading

ability students more than higher reading ability students.—*Journal abstract.*

1344. Dansereau, Donald F. et al. (Texas Christian U, Inst for the Study of Cognitive Systems) **Learning strategy training program: Paraphrasing strategy for effective learning.** *US AFHRL Technical Report*, 1975(Jun), No. 75-46, 201 p. Describes an effective integrated learning strategy program emphasizing a connection technique using paraphrasing. The components were derived from a review of the educational and psychological literature and from an analysis of the responses to the learning strategy inventory. Also, 2 other training packages (visual imagery and question-answer connection) were evaluated. Results show improved long-term retention when using paraphrasing by the trained group of 88% over an untreated control group. With appropriate insertion of blank pages this report can be used to provide learning strategy training.—*Journal abstract.*

1345. Dansereau, Donald F. et al. (Texas Christian U, Inst for the Study of Cognitive Systems) **Effective learning strategy training program: Development and assessment.** *US AFHRL Technical Report*, 1975(Jun), No. 75-41, 58 p.—Potentially effective and trainable learning strategies were identified by an analysis of a specially developed learning strategy inventory and a review of educational and psychological review literature. 4 aspects of the learning process suggested the usefulness of special training: the identification of important or unfamiliar material, the applications of techniques for the comprehension and retention of this information, the efficient retrieval of information, and the skill in coping with distractions during the foregoing processes. A training program was developed for teaching selected specific strategies, including the 3 alternative comprehension-retention strategies of paraphrasing, question-answering, and the use of visual imagery, in such a way as to compare the 3 alternative connection techniques. Minimal strategy training showed significant results in long term retention, although no reliable differences were found in immediate testing. Further refining of the techniques is recommended. An effective strategy training program suitable for implementation in technical training was created, modified, and assessed. (4 p ref)—*Journal abstract.*

1346. Dansereau, Donald F. (Texas Christian U, Inst for the Study of Cognitive Systems) **Learning strategy training program: Questions and answers for effective learning.** *US AFHRL Technical Report*, 1975(Jun), No. 75-48, 203 p.—Presents an effective integrated learning strategy program emphasizing a connection technique employing questions and answers. The components were derived from a review of the educational and psychological literature and from an analysis of the responses to a learning strategy inventory. Also, 2 other training packages (visual imagery and paraphrasing connection) were evaluated along with this package in a controlled experiment. This program improved long-term retention of factual material.—*Journal abstract.*

1347. Dansereau, Donald F.; Long, Gary L.; McDonald, Barbara A. & Actkinson, Tomme R. (Texas Christian U, Inst for the Study of Cognitive Systems) **Learning strategy inventory development and assess-**

ment. *US AFHRL Technical Report*, 1975(Jun), No. 75-40, 31 p. Developed a learning strategy inventory composed of 201 multiple choice items based upon similar work and aspects suggested from a literature review. Correlational and factorial analyses (based upon approximately 200 undergraduate) were performed to provide a basis for identifying trainable learning strategies. 4 phases of the learning process were identified and incorporated into a learning strategy training development program (see V.188, Issue 1). The learning strategy inventory provided an effective basis for strategy training development. In addition, the learning strategy inventory provides a significant first step in the development of a more general instrument for diagnosing learning strategy inadequacies in specific individuals.—*Journal abstract.*

1348. DeShields, Shirley M. (U Massachusetts, Ctr for Urban Education Analysis) **The traditional approach versus the process discovery approach to the teaching of science to urban youth.** *Journal of Negro Education*, 1975(Winter), 44(1), 1-11. Compared development of scientific thinking in 185 second graders in a discovery method versus program with development among 19 boys and 11 girls in a program where scientific principles were demonstrated through traditional experimentation. Form C and D of the Science Research Associates Elementary Science Battery were administered to each group in SS, all of whom were Black, low-income, public-school 5th graders in Washington, D.C. Form W, Intermediate II—Partial Battery of the Stanford Reading Achievement Test was used to help select students and to equate the groups. The median age of each group was 11. Initial science means did not differ significantly, but terminal science means favored the discovery group. Terminal science means did not differ significantly, but terminal science means favored the discovery group. Terminal means for both groups were significantly higher than corresponding initial means. It is concluded that although the discovery approach appears more effective than the traditional approach in fostering science comprehension, and other variables need examining before definite decisions can be made regarding the teaching of science.—B. M. Anthony.

1349. Duckworth, D. & Entwistle, N. J. **The swing from science: A perspective from hindsight.** *Educational Research*, 1974(Nov), Vol 17(1), 48-53.—Re-examination of the statistical evidence which had indicated a "swing away from science" among British 6th-form pupils during the 1960s raises questions about the conclusions of the Dainton Committee in 1968. It is noted that the trend was away from both physical science and foreign language (subjects perceived to be difficult) toward English and the social sciences (subjects perceived to be less restrictive). A research study of 314 2nd and 292 5th formers' attitudes toward 9 secondary school subjects was conducted. Results suggest that studies in the scientific disciplines demand more intellectual maturity than 6th-form students have, and hence discourage them.—J. B. Francis.

1350. Earnshaw, George L. (Syracuse U) **Open education as a humanistic intervention strategy.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1175.

1351. Eberley, Robert E. (U Missouri, Columbia) **The development of emotional independence as a factor in autonomy.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1074-1075.

1352. Edwards, Floyd H. (U North Carolina, Chapel Hill) **A study of affective change in elementary schools implementing individually guided education.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 207-208.

1353. Evans, Richard I.; Rozelle, Richard M.; Noblitt, Robert & Williams, Don L. (U Houston) **Explicit and implicit persuasive communications over time to initiate and maintain behavior change: New perspective utilizing a real-life dental hygiene situation.** *Journal of Applied Social Psychology*, 1975(Apr-Jun), Vol 5(2), 150-156.—Reacting to the failure of most persuasive communications to maintain behavior changes once they are established, in the context of junior high school dental hygiene programs, the present investigation explored the effects of behavioral measurement itself (as an unplanned treatment effect) in maintaining a specific behavior once it was established. A modified time-series extension of a basic pretest-treatment-posttest design was used with 181 female junior high school students; it included a variety of treatment conditions and a novel behavior measure as the dependent variable. Results establish that the process of measuring behavior itself was possibly as effective as treatment conditions. All conditions effected behavior changes and maintained them for a 10-wk period. (17 ref)—*Journal abstract*.

1354. Falk, Robert J. (U Minnesota) **Environmental influence on the attitude and achievements of freshman students having low predicted college achievement.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 169.

1355. Fischer, James A. (Boston Coll) **Effects of a cue synthesis procedure and post-questions on the retention of prose material.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 615-616.

1356. Flannery, Raymond B. & Baer, Daniel J. (Somerville Mental Health Clinic, MA) **Paradox of experimental failure/experiential success in three models of behaviorally altering academic self-esteem.** *Psychological Reports*, 1975(Aug), Vol 37(1), 170.—Compared the efficacy of hypnosis, suggestion, covert control (behavior) therapy, and an attention-control procedure in increasing self-esteem in college students. Analyses of covariance with repeated measures design of psychological tests and overt behaviors were not significant, yet Ss reported academic gains and meaningful research experiences.

1357. Gilmore, George B. (U Toledo) **An experimental study to determine which of five different practice procedures is more effective in the acquisition of a complex motor skill.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 605.

1359. Hardy, Robert E. **The effects of praise as a generalized reinforcer on selected variables in secondary school classrooms: A behavior modification**

approach. *Pupil Personnel Services Journal*, 1975, Vol 4(1), 41-44.—Explores the effect of behavior modification techniques on the number of voluntary hand-raising responses, verbal responses, and students' perceptions of the teacher and of study habits. 53 secondary students were randomly assigned to one of 3 psychology courses. Baseline data were gained on each of the dependent variables prior to the treatment which consisted of regular verbal praise of the class by the teacher during the experimental period. The treatment was followed by a 10-day extinction period. Results did not support the effectiveness of verbal praise as a generalized reinforcer. —R. W. Covert.

1360. Holmes, Joseph E. (U Virginia) **An experimental study of the achievement gain of secondary school pupils whose student teachers use behavioral objectives.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 649.

1361. Hornik, Robert C. (Stanford U) **Television, background characteristics and learning in El Salvador's educational reform.** *Instructional Science*, 1975(Oct), Vol 4(3-4), 293-302.—Attempted to determine whether the introduction of instructional TV (ITV) in the schools of El Salvador had a significant incremental impact on the learning of 29 classes of students in grades 7-9 (Third Cycle). 3 types of variables were examined: (a) student (general ability, reading and achievement tests); (b) community (educational availability, ease of access to a large city, and community resources); and (c) school (school size, physical condition, school facilities, and adequacy of teaching materials). Almost all of the variables were closely related. Children from the highest socioeconomic strata attended the best equipped schools in the most urban and wealthy communities, and they had the highest scores on the cognitive skills indices. They also brought better skills to the Third Cycle and were favored in the distribution of school resources. 15 classes with ITV and 11 without were ranked according to their scores at the beginning of the Third Cycle and again at the end. At the beginning of the 7th grade, the ITV and non-ITV subsamples achieved virtually identical mean ranks of 13.5. The mean rank at the end of the 9th grade in ITV classes 18.2, risen to 10.1, while the non-ITV mean had fallen to 18.2.—M. E. Pounsel.

1362. Hunt, David E. (Ontario Inst for Studies in Education, U Toronto, Canada) **Learning styles and teaching strategies.** *Behavioral & Social Science Teacher*, 1974(Fal), Vol 2(1), 22-34.—Describes a conceptual model linking teaching strategies with students in terms of their learning styles. Ways of assessing learning styles and educational arrangements to implement the matching are presented. (19 ref)

1363. Janczarek, Katherine M. (U Illinois, Urbana-Champaign) **The effects of early mastery on later performance in an undergraduate psychology course.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 618.

1364. Johnson, David P. (Tulane U) **A study of relationships between drug abuse education and attitudes toward six classes of abused drugs.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1364.

1365. Jones, Robert R. (Duke U) **The effect of the Emergency School Assistance Program on racial attitudes of selected secondary school students in North Carolina.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 530-531.

1366. Kalunian, Peter; Lopatich, Gretchen & Cymerman, Sandy. **Changing sex role stereotypes through career development.** *Psychology in the Schools*, 1975(Apr), Vol 12(2), 230-233. Describes a career education program for use in elementary schools, consisting of 3 phases: (a) development of increasing self-awareness and a positive self-concept; (b) role reconditioning; (c) developing new attitudes about sex roles and the world of work. Specific examples for each phase are given.—H. Kaczowski.

1367. Kanov, Jeffrey F. (U Florida) **The effects of teacher-determined and student-determined contingencies of reinforcement on academic response rate.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 192-193.

1369. Kiekel, Jack L. (U Oregon) **A study of the academic progress and the expressed and wanted social interactions of the "Live and Learn" program freshmen compared with the honors college freshmen at the University of Oregon 1971-72.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1096-1097.

1370. King, Anne T. **Impact of computer-based instruction on attitudes of student and instructors: A review.** *US AFHRL Technical Report*, 1975(May), No 75-4, 30 p.—Examines the evidence which bears on the issue of whether contact with computer-based instruction leads to feelings of "depersonalization" or "dehumanization." The approach was to document investigations which employ the larger construct of "attitudes" toward various modes of computer-based instruction which are found to be held by students and instructors before, during, or after exposure to computer-based instruction. Evaluation of pertinent factors which influence attitudes was made through an assessment of relevant literature and personal communication with experts associated with several computer assisted or managed projects in the US. Results indicate that computer-based instruction may not be a threat to humanization, but in fact when used properly can increase the effectiveness and personalization of the instructor-student relationship. Specific recommendations for optimizing computer-student interactions are presented.—*Journal abstract*.

1371. Kirschner, Neil M. & Levin, Louis. (Bowling Green State U) **A direct school intervention program for the modification of aggressive behavior.** *Psychology in the Schools*, 1975(Apr), Vol 12(2), 202-208. Outlines an intervention program for modifying aggressive behavior by elementary schoolchildren. The program includes positive reinforcement, behavioral rehearsal, and modeling. A study that measured the effectiveness of the program is reported.—H. Kaczowski.

1372. Lawson, Tom E. (U Illinois, Urbana-Champaign) **The effects of specificity and placement of instructional objectives on attitude and intentional and**

incidental learning. *Dissertation Abstracts International* 1973(Aug), Vol 34(2-A), 679.

1374. Löfgren, Horst. **Teaching methods and teaching materials in German: A survey of the UMT project with report abstracts.** *Pedagogisk Dokumentation*, (Nov), No 32, 21 p.—Describes the background, goals, and design of the UMT (Methods of Teaching German) system and gives references and abstracts on general survey of the UMT project, pedagogical analyses of prerequisites, pedagogical process analyses, pedagogical product analyses, and the UMT project's teaching system "Deutsch."

1375. Mansell, Jack. (Paddington Technical Coll, England) **Team teaching in further education.** *Educational Research*, 1974(Nov), Vol 17(1), 19-26.—Conducted a 5-yr study which compared attitudes and performance of team-taught technician students with those of students taught traditionally. Results suggest superiority of team teaching but cross-year variability indicated need for further study. (16 ref)

1376. Mattern, Patrick M. (Syracuse U) **Natural reading rate training and psychological correlates of success.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 173.

1377. McLaughlin, T. F. & Malaby, J. E. (Spokane School District No 81, WA) **Differential effects of token reinforcement to increase class participation in constructing questions over science films.** *Psychological Reports*, 1975(Aug), Vol 37(1), 306.—Investigated the effectiveness of token reinforcement (points) on the mean number of questions constructed by pupils in a combination 5th- and 6th-grade classroom. Data indicate that pupils with average and high rates of constructing questions were affected most by the token-reinforcement procedures.

1378. McVey, Ronald F. (Fordham U) **Changes in selected personality variables of educational auxiliary personnel enrolled in a psychology course utilizing group processes.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 138.

1379. Mealor, David J.; Perkins, Mark L. & Reeves, John E. (U Georgia) **Academic achievement and attendance in an open school.** *Psychological Reports*, 1975(Aug), Vol 37(1), 171-174.—Compared student achievement and attendance in an open school setting with achievement and attendance in a traditional setting. 80 4th graders of low socioeconomic status were randomly selected, 40 from an open school and 20 from each of 2 traditional schools in rural Georgia. The Iowa Test of Basic Skills served as a measure of academic achievement. Analysis of variance showed significant but mixed findings: differences in total Language, Mathematics, and Composite scores favored the open school and 1 traditional school, but more total days absent were reported for the 2 traditional schools. Percentage of variance accounted for was 15% or less for academic scores, 24% for attendance.—*Journal abstract*.

1380. Miller, James B. (Fordham U) **An analysis of personal traits, perceptions of remedial courses and**

college grade point average of open admissions freshmen. *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 124.

1381. Moody, David B. (U Missouri, Columbia) Learning and retention and the cognitive level of behavioral objectives with social studies independent study materials. *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1179.

1382. Motz, Annabelle B. & Hollander, Elaine K. (American U) When Black and White college students meet: Experiences in interracial awareness. *Journal of Negro Education*, 1975(Win), Vol 44(1), 42-52.—Describes intergroup classroom experiences in 2 Washington, D.C. colleges, one largely Black and one largely White. 12 interaction sessions occurred in pairs over 3 academic years, each college acting as host for 1 session of each pair. Interactions were designed to provide interracial experiences and to facilitate classroom learning through group participation. Preparations for sessions were made jointly by the 2 instructors to insure appropriate scheduling, objectives, techniques, evaluation, feedback, and integration of group experiences with content of courses. Results were that students (a) grasped group-interaction principles, (b) related group experiences to subject matter, and (c) interacted meaningfully with the teachers and each other.—B. M. Anthony.

1383. Myrow, David L. (U Illinois, Urbana-Champaign) An investigation of some aspects of choice in learning. *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 620-621.

1384. Oakland, Thomas & Williams, Fern C. (U Texas, Austin) An evaluation of two methods of peer tutoring. *Psychology in the Schools*, 1975(Apr), Vol 12(2), 166-171.—Examined the effectiveness of peer tutors as a means of improving the reading performances of other children. Ss were 33 3rd and 4th graders reading below their grade level, and 46 children trained as tutors. The poor readers were divided into a total tutorial group, a supplementary tutorial group, and a control group who received no tutoring. Differences between the 3 groups on the Metropolitan Achievement Test subtests of Word Knowledge and Comprehension were not statistically significant.—H. Kaczowski.

1385. Peltz, Fillmore K. (Hofstra U) The effect upon comprehension of repatterning materials based on students' writing patterns. *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 212.

1386. Phillips, Bonnie D. (U Northern Colorado) The effect of the cloze procedure on content achievement and reading skills in a junior college introduction to business course. *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 212-213.

1387. Potter, Rosemary L. (U Miami) The effect of a verbal comprehension experience derived from boy-chosen commercial television programs on verbal comprehension of first-grade boys differentiated by entrance age. *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 669-670.

1388. Preston, Fredrick. (U Illinois, Urbana-Champaign) An investigation of the emphasis on creative thinking in selected language arts textbooks for grades four, five and six. *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 670.

1389. Railsback, Clem L. (U Texas, Austin) A comparison of four automated auditory-visual techniques to teach the strong verbs to Black, male, adolescent dropouts. *Dissertation Abstracts International* 1973(Aug), Vol 34(2-A), 561.

1390. Ratz, H. C. (U Waterloo, Canada) Observations on the duration of the Ph. D. programs. *IEEE Transactions on Systems, Man, & Cybernetics*, 1975(Sep), Vol 5(5), 543-544.—Derives a statistical distribution for the lengths of Ph D programs from which are derived functions analogous to those of elementary reliability theory. These show that the anticipated future duration of these research programs does not decrease uniformly, so that there are diminishing returns from further work almost to the point where the expected date of completion remains a constant distance in the future.

1391. Record, Wilson. (Portland State U) Can Black studies and sociology find common ground? *Journal of Negro Education*, 1975(Win), Vol 44(1), 63-81.—Explored the possibilities for resolving conflict between sociology and Black Studies. 173 White and 36 Black sociologists and over 50 present or past Black Studies directors were interviewed. 23% of the Whites were "embracers," classified as either "instrumental," "moderate," or "militant," who favored Black Studies for a variety of reasons. 31% were "accommodators," who were neutral. The 21% who were "antagonists" were actively opposed to Black Studies, objecting to curriculum, personnel, establishment procedures, and denigration of established sociologists. Few females were in this group. The 22% termed "dropouts" usually experienced difficulties with Black Studies and withdrew from the race-ethnic arena. Black Studies were favored by (a) 28% of the sample, (b) the younger more than the older Ss, (c) Blacks, especially females, more than Whites. Black Studies directors were not enthusiastic over the contributions of White race-ethnic specialists. Suggestions are made for resolving the Black Studies vs sociology conflict. (68 ref)—B. M. Anthony.

1392. Reid, Thomas G. (Arizona State U) Differences in creativity and relationships between creativity and achievement effected by the directed discovery and direct detailed teaching methods. *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1166-1167.

1393. Reynolds, Philip R. (U Rochester) Understanding conditional statements at the tenth grade level. *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 125.

1394. Richards, Freddie L. (Pennsylvania State U) Effects of performance objectives on electrical skill learning of educationally disadvantaged students. *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1167.

1395. Richer, Howard M. (U California, Los Angeles) Peer teaching as a facilitator of learning: Using conservation of substance as a measure. *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 641-642.

1396. Roach, Donald W. (U South Florida) Automated aural-visual music theory instruction for elementary education majors. *Journal of Research in Music Education*, 1974(Win), Vol 22(4), 313-318.—Administered a self-instructional linear program employing both a programmed text and taped musical examples and narra-

tion to 31 elementary education majors. Ss showed significant gains in knowledge of music theory in comparison with controls who received no music instruction during the experimental period.

1397. Robinson, Harry. (U Illinois, Urbana-Champaign) **The organization and administration of a learning resources center in a small college: A conceptual model.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 623-624.

1398. Ruble, Diane N.; Croke, Julie A.; Frieze, Irene & Parsons, Jacquelynne E. (Princeton U) **A field study of sex-role attitude change in college women.** *Journal of Applied Social Psychology*, 1975(Apr-Jun), Vol 5(2), 110-117.—Examined to what extent women's studies courses are effective in changing sex-role attitudes in college women. Pre- and posttest questionnaires were administered in 2 studies to a total of 178 female students in women's studies courses. Factor analyses were performed on the questionnaire data to produce summary variables for the change analysis and to examine the structure of sex-role ideology. The results, consistent in both studies, show the Ss' sex-role beliefs were comprised of definable areas and that awareness of sex discrimination and traditional beliefs regarding the proper roles for men and women were more susceptible to influence than were other types of variables.—*Journal abstract*.

1399. Schain, Stephen. (U Illinois, Urbana-Champaign) **Learning of low ability children and tutor behavior as a function of the self-fulfilling prophecy.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 642.

1400. Schulz von Thun, Friedemann; von Berghes, Marita; Langer, Inghard & Tausch, Reinhard. (U Hamburg, Psychologisches Inst III, W Germany) [Overview of a theory of improving comprehension through shortening and simplifying scientific articles.] (Germ) *Zeitschrift für Entwicklungspsychologie und Pädagogische Psychologie*, 1974, Vol 6(3), 192-206.—Presents evidence that scientific publications can be prepared so they are more comprehensible to students. 10 summaries of publications which appeared in 2 psychology journals were randomly selected, and experts improved the summaries along 4 dimensions (simplicity, organization-structure, brevity, and additional stimulation). Evaluation of original and revised summaries showed that 9 of the 10 revised summaries had higher scores along dimensions of simplicity and organization-structure. Students used all summaries in studying. Comprehension and retention were assessed through free recall and written examination. Students of different academic levels secured higher scores on all 10 revised summaries. Results are promising from an instructional viewpoint, but may only mean that improved teaching stems from tighter organization and more lucid presentation of material, which in turn increases the comprehensibility of psychological material. (English summary)—R. Scott.

1401. Srivastava, Devendra. **Teaching and examination reform.** *Teacher Education*, 1974(Jul), Vol 8(4), 11-18.—Explores the possibility of reforming the examination process by improving mechanics of the examination and the interpretation of results. The relationship of this process to reforming the educational system as a whole is discussed.—R. W. Covert.

1402. Stallings, Everett S. (Florida State U) **A comparison of the inquiry behavior of ISCS and non-ISCS science students as measured by the Tab Science Test.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1149-1150.

1403. Stoll, William C. (U Kentucky) **Drug-abuse education in selected school systems in the United States.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1088.

1404. Suppes, P.; Fletcher, J.D. & Zanotti, M. (Stanford U) **Performance models of American Indian students on computer-assisted instruction in elementary mathematics.** *Instructional Science*, 1975(Oct), Vol 4(3-4), 303-313.—Conducted a 30-day experiment with a total of 69 4th, 5th, and 6th grade native Americans to examine the theory of P. Suppes (1973) in which the amount of time a student spends on a curriculum is a function of his progress and his achievements in given course objectives (which are individually set for each student) are expressed as posttreatment grade placement (GP). Using the predictive-control models integrated into computer-assisted instruction (CAI) as described by Suppes et al, each S's performance history was examined daily to determine whether he needed 1 or 2 mathematics strands sessions on the next day in order to reach the GP set for him. 2 performance goals were set: one was externally derived (a gain of .33 in GP), and the other was internally derived (determined from each student's performance history). Results support the conclusion that the mathematics strands CAI curriculum can lead to substantial increases in mathematics GP when used by native American students.—M. E. Pounsel.

1405. Sussman, Gilbert. (Fordham U) **The effects of writing about self on the self-esteem of fifth and sixth grade children.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 179.

1406. Tupesis, Janis A. (U Wisconsin) **Mathematics learning as a consequence of the learners' involvement in interactive problem-solving tasks.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 126-127.

1407. Uche, Ukaonu W. (Winston-Salem State U) **The problem of teaching science in community colleges.** *Behavioral & Social Science Teacher*, 1974(Fal), Vol 2(1), 48-55.—Identifies typical problems facing the teaching of social science in community colleges: (a) low academic ability and motivation, (b) socio-economic background of the student, (c) job-academic conflict, (d) noncollege-oriented student, (e) teaching situation, and (f) teaching approaches. These problems and methods to minimize them are examined. It is concluded that the instructor or professor should accept the fact that he is there to help socialize the students to handle the humanistic abstract concepts that the liberal arts education process requires. He must also adopt a more pragmatic philosophy of education of his own in order to succeed.—*Journal abstract*.

1422. Brady, Peter J.; Rickards, John P. & Felker, Donald W. (Purdue U) **Affective outcomes of evaluation strategies by self and another in children's learning from textbook material.** *Psychological Reports*, 1975(Aug), Vol 37(1), 311-317.—Assigned 51 male and 27 female 4th graders to 1 of 2 evaluation groups which read and answered questions on textbook material. One group (self-evaluation) judged the correctness of their answers and reinforced themselves, while the other group (other-evaluation) was judged and reinforced by some other person. Affective measures included the Piers-Harris Self-Concept Scale, the Self-Concept Statement Scale, the Intellectual Achievement Responsibility Questionnaire, and the Children's Manifest Anxiety Scale. Results show that girls accepted more responsibility for unsuccessful academic performance than boys and that in the self-evaluation condition, boys were significantly less anxious than girls and less likely to lie. Results further suggest that boys who evaluated themselves tended to experience reduced anxiety and have enhanced self-concept more than boys who were evaluated by others.—*Journal abstract*.

1437. Grimmer, Sadie A. (Indiana U, Inst for Child Study) **Black and White children's free recall of unorganized and organized lists: Jensen's Level I and Level II.** *Journal of Negro Education*, 1975(Win), Vol 44(1), 24-33.—Tested A. Jensen's (see PA, Vol 43:9740) theory of differences among Blacks and Whites in conceptual (Level II) and associative (Level I) learning abilities. Ss were 60 lower-class 1st graders divided equally by sex and ethnic background. Tape-recorded lists—organized (List 2) and unorganized (List 1)—from the AA and A Thorndike-Lorge frequencies, and a digit span test (considered a Level I measure) were used. List 2 was used with pictures under 3 learning conditions. Analyses of variance and chi square analyses were made of recall scores. There were no race, sex, or condition effects on clustering-type recall. List 1 (a Level I task) and List 2 (a Level II task) were significantly related for both Blacks and Whites, especially for Blacks. The digit span mean for Blacks was significantly higher than that for Whites. These and other findings largely contradict Jensen's theory. Possible explanations are suggested. Teaching 1st-grade Blacks by rote seems unwarranted. —B. M. Anthony.

1444. Kelly, Delos H. (State University Coll New York, Geneseo) **Status origins, track position, and delinquent involvement: A self-report analysis.** *Sociological Quarterly*, 1975(Spring), Vol 16(2), 264-271.—In reviewing recent trends in delinquency theorizing and research, it is noted that track position, independent of status origins, is highly associated with such behavioral outcomes as youth rebellion and official delinquency. This observation given its theoretical and policy implications, was studied using self-report delinquency data obtained from 173 seniors (both males and females) attending 2 high schools in western New York State. Analyses indicate that these data are strongly supportive of the recent trends noted. Track position, relative to both sex and status origins, was the strongest predictor of self-report delinquent involvement. (39 ref)—*Journal abstract*.

(US Dept of Commerce, Bureau of the Census, Washington, DC) **Does migration interfere with children's progress in school?** *Sociology of Education*, 1975(Sum), Vol 48(3), 369-381.—Analysis of US Bureau of the Census data showed that frequent interstate migration is associated with an increased likelihood of being enrolled below the modal grade for age among children whose parents are not college graduates. For children of college graduates frequent interstate migration is associated with a reduction of

grade skipping. Interstate is most likely to be undertaken by well-educated persons whose children tend to do well in school, and for this reason children who have made frequent interstate moves are less likely to be behind in school than less mobile children. The overrepresentation of the highly educated among long-distance movers is offered as partial explanation of why growing communities tend to have children of above average scholastic ability. Classroom Dynamics & Student Adjustment & Attitudes

1465. Abeles, H. F. (U North Carolina, Greensboro) **Student perceptions of characteristics of effective applied music instructors.** *Journal of Research in Music Education*, 1975(Sum), Vol 23(2), 147-154.—Describes the development of a 4-factor (rapport, instructional systemization, instructional skill, and musical knowledge) 30-item rating scale for systemizing student evaluations of faculty in applied music instruction. The facet-factorial scale development procedure was employed. A total of 81 undergraduate and graduate students used the scale to rate music faculty. Results indicate the scale is appropriate to employ in the evaluation of applied faculty. The interjudge reliability estimates for the scale were sufficiently high (.88-.96) and the relationship with an appropriate criterion variable, student performance, seemed acceptable (.60).—*Journal abstract*.
1466. Acker, Loren E.; Oliver, Peter R.; Carmichael, John A. & Ozerkevich, Michael J. (U Victoria, Canada) **Interpersonal attractiveness and peer interactions during behavioural treatment of the target child.** *Canadian Journal of Behavioural Science*, 1975(Jul), Vol 7(3), 262-273.—In an attempt to evaluate the consequences of operant techniques in addition to changes in the target behavior of a 10-yr-old boy, an individual-contingent, group-reinforcement program was implemented in a regular classroom containing 5th and 6th graders. Periods of on-task behavior by the target child were reinforced by the provision of special activities in which all class members participated. Major results included (a) the effective control of the target child's on-task behavior, (b) an observed decrease by peers of social interactions with the target child as the study progressed but only during those times when the target child was off-task, and (c) an initial decrease and subsequent recovery in the popularity (as measured by a sociometric questionnaire) of the target child following implementation of the contingency program. (French summary) (16 ref)—*Journal abstract*.
1467. Acredolo, Linda P. & Pick, Herbert L. (State U New York, Buffalo) **Evaluation of a school lunch program.** *Psychological Reports*, 1975(Aug), Vol 37(1), 331-332.—To evaluate the relative merits of 2 commercial hot lunch programs, data were collected using a rating of consumption, a parental questionnaire, and a child's questionnaire. Data from 170 3rd and 6th graders in the 2 schools participating in the programs were compared in the context of similar comparisons between 2 control schools which were matched with the experimental schools on the basis of size and socioeconomic level. Consumption ratings and data from the parental questionnaire ($N = 450$ parents) supported 1 of the 2 programs. Consumption ratings and ratings of children's preferences correlated 0.87.—*Journal abstract*.

1472. Bouae, J. J. et al. (Washington U, St Louis) **Frequency of depression in the freshman year as measured in a random sample by a retrospective version of the Beck Depression Inventory.** *Journal of Consulting & Clinical Psychology*, 1975(Oct), Vol 43(5), 746-747.—Reports a study of college sophomores in which 75% of respondents reported having experienced at least mild depression in the preceding year. To evaluate the high proportion of students reporting depression, a 2nd, greatly expanded study of relative rates of depression in undergraduates has been undertaken at 4 universities.
1473. Bradley, Fred O. & Newhouse, Robert C. (Kansas State U) **Sociometric choice and self perceptions of upper elementary school children.** *Psychology in the Schools*, 1975(Apr), Vol 12(2), 219-222.—Investigated the relationship between socioeconomic choice and self-concept of 158 6th graders. Each child completed the Piers-Harris Children's Self-Concept Scale and listed the names of 3 classmates he liked best and 3 he liked least. From the 2-dimensional analysis of variance of the data it is concluded that the concept of self was a factor closely related to how children are perceived by their peers. Boys confined their choices mainly to boys, and girls chiefly to girls.—H. Kaczowski.
1474. Britton, Ronald B. (U Missouri, Columbia) **Stability and change of education freshmen personality characteristics and environmental perceptions.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1094-1095.

1477. Chien, Maw-fa. **A comparative study of adjustment problems among Chinese and American college students.** *Bulletin of Educational Psychology*, 1974(Jun), Vol 7, 77-87.—Investigated college students' adjustment problems in the light of different cultural backgrounds, with variables of sex, class, and college major. Ss were 720 undergraduates drawn by stratified sampling from 1 university in Taiwan and 1 university in

the US. The Mooney Problem Check List (college form) and a supplementary questionnaire devised by the author were used. Results show that (a) cultural backgrounds were significantly correlated with the number of problems, (b) in both universities lower classmen reported more problems than did upper classmen, and (c) "curriculum and teaching procedure" is a major problem area for Chinese students but not for Americans.—*Journal summary*.

1478. Cowen, Emory L.; Lorion, Raymond P. & Caldwell, Robert A. (U Rochester) **Nonprofessionals' judgments about clinical interaction problems.** *Journal of Consulting & Clinical Psychology*, 1975(Oct), Vol 43(5), 619-625.—Established helper-judged frequency and discomfort values for potentially challenging interaction situations between nonprofessional child aides and young maladapted school children. Ss were 49 child aides with 1-3 yrs intensive experience, under supervision, with 10-50 primary graders. Helper discomforts were found to cluster meaningfully. Child aggression, family problems, and limit-testing behavior produced greater helper discomfort than the child's need to have the aide for himself or to be dependent. Rarely experienced situations had the highest judged discomfort ratings.—*Journal abstract*.

1479. Culbertson, Frances M. (U Wisconsin, White-water) **Average students' needs and perceptions of school psychologists.** *Psychology in the Schools*, 1975(Apr), Vol 12(2), 191-196.—Investigated students' perception of the school psychologist and his role, and how his role related to their felt needs and concerns. Ss were 74 students in 2 university psychology courses. A questionnaire was used to survey student attitudes. It is concluded that the Ss viewed the school psychologist as a helper and as an assessor of students' abilities rather than as a behavior modifier.—*H. Kaczkowski*.

1480. de Bruyn, Eric & Stinissen, Juul. (Ctr voor Psychodiagnostiek, Louvain, Belgium) **A factor-analytical comparison of fantasy and questionnaire measurements of achievement-related motives.** *Psychologica Belgica*, 1975, Vol 15(1), 1-10.—Tested 243 Dutch-speaking senior high school females with 17 achievement related fantasy (TAT) and questionnaire measurements to test 5 hypothesized factors of achievement motivation: fear of failure, personal need achievement, social need achievement, the projective motive to attain success, and the projective motive to avoid failure. Factor analysis by principal axis confirmed the 5 factors and the construct validity of McClelland and Arnold projective systems for scoring the achievement content of stories. Factor analysis by varimax rotation applied to questionnaire items yielded the dimensions of (a) personal vs social need achievement, (b) scholastic achievement anxiety vs intelligence test anxiety, and (c) personal risk anxiety. No physiological factor was found. Further research is suggested to determine the degree to which results are due to homogeneous female composition of the sample. (20 ref) —*S. Slak*.

1481. Delforge, Gary D. (U Arizona) **Attitudes of physically handicapped and nonhandicapped college students toward physical activity.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1116.

1482. Erlich, A. C. **Ratings of school practices.** *Purdue Opinion Panel Poll Report*, 1974(Feb), No 99, 19 p.—Analyzed responses of a stratified sample of 2,000 high school students and 862 teachers at randomly selected schools to questionnaires related to school practices. There were discrepancies in students' and teachers' reports of success in attainment of educational goals. Issues of high concern to students included relevance of the material and the interest of teachers. The need to review and revise educational objectives in keeping with changing societal mores is stressed; however, clear objectives are necessary as guidelines. Teachers and students also had divergent opinions on discipline: teachers viewed rules as more lenient and poorly enforced. It is suggested that it may be dangerous to enact or change rules if students perceive existing ones as strict and well enforced. There was more student-teacher agreement on questions related to need for physical improvement of schools. Appendixes present regional, sex, and grade breakdowns of students' responses to all 55 questions. (23 ref)—*C. Wright*.

1483. Gadzella, Bernadette M. (East Texas State U) **Student role expectations.** *Psychology in the Schools*, 1975(Apr), Vol 12(2), 186-190.—Investigated to what extent there was agreement or similarity regarding student role expectations among 513 university students enrolled in courses in introductory, educational, adolescent, applied, and industrial psychology. A questionnaire concerning students' views of a ideal student was used to gather data. Results indicate that students viewed an ideal student as one who has definite objectives and reasons for being in college, thinks independently about topics discussed in class, strives for high goals, comes to class prepared, and tries even when topics and subjects are difficult.—*H. Kaczkowski*.

1488. Harvey, Ann L. (U Alberta, Faculty of Education, Edmonton, Canada) **Goal-setting as compensation for fear-of-success.** *Adolescence*, 1975(Spr), Vol 10(37), 137-142.—54% of the stories written by 95 junior high school females to an academic achievement cue reflected fear-of-success (FOS) themes. Groups of Ss then identified mistakes in a set of pictures. 5 groups were encouraged to set goals as they worked, adjusting their goals according to performance level; 3 groups were given control instructions. Ss who wrote positive stories and received control instructions showed the best

performance. Goal-setting instructions appeared to compensate for the effects of FOS. —A. Aronson.

1489. Hoffman, Alan; Pietrofski, John J. & Spiegle, Howard H. (Wayne State U) **Human sexuality: Can values be clarified in the schools?** *Behavioral & Social Science Teacher*, 1974(Fal), Vol 2(1), 40-47.—Considers informational, affective, and attitudinal dimensions of student sexuality. Strategies of values clarification, moral education, and consultation activities which can be applied to sexual problems are presented. The use of a "C" group, in which teachers share concerns about student sexuality with parents, is described. A theory of moral development and several exercises in values clarification are also presented. (15 ref)—R. Tomasko

1491. Labovitz, Eugene M. (San Diego State U) **Race, SES contexts and fulfillment of college aspirations.** *Sociological Quarterly*, 1975(Spring), Vol 16(2), 241-249.—Examined the differential effects of social contexts and race on educational behavior in terms of a causal process model. Based on data from 6,294 high school seniors in San Diego, the role of social contexts were found to be important through a causal process in which socioeconomic status (SES) contexts affect personal characteristics which, in turn, influence educational aspirations and attainment. Utilizing both correlational and tabular techniques, the basic model held for all racial (ethnic) groups; however, race affected the level of the individual variables. Findings suggest that the importance of SES contexts are mediated by race and contingent upon the common relations of these contexts and educational behavior to individual characteristics. (21 ref)—*Journal abstract*.

1492. Lew, William J. (Chinese U Hong Kong, School of Education) **Cross-cultural education and attitude change: Asian students' attitudes toward America.** *Bulletin of the Institute of Ethnology, Academia Sinica*, 1974, No 38, 1-19.—Studied the attitudes toward America of 390 Asian students on 10 US campuses, using a questionnaire developed by the investigator in a quasi-longitudinal design. The questionnaire contained 40 items, each with 2 7-point scales to measure both the S's present attitude and his attitude before coming to the US. The questionnaire also had 23 closed questions and one open-ended question to secure additional information. A control group of 82 US-bound Chinese students was used to test the accuracy of the recalled "before" response of the experimental Ss. The main results indicate that the Asian students' attitude and its change varied with the aspects of areas of American society and culture.—*Journal abstract*.

1501. Pritchett, W. & Willower, D. J. (Philadelphia Public Schools, PA) **Student perceptions of teacher pupil control behavior and student attitudes toward high school.** *Alberta Journal of Educational Research*, 1975(Jun), Vol 21(2), 110-115.—Administered Helsel and Willower's Pupil Control Behavior Form and Coster's High School Students' Opinion Questionnaire to 852 junior and senior high school students. A significant relationship between student perceptions of custodial teacher pupil control behavior and negative attitudes toward school was found. This relationship pertained to overall student attitudes and to each of 6 factors resulting from a factor analysis of Coster's questionnaire (Appropriateness of School Work, School Program, Social Acceptance, School, Social Context, and Teachers). Limitations of the findings (e.g., the lack of control for other variables and the low to moderate correlation coefficients) are noted.—L. Gorsey.

1509. Thompson, Barbara. **Self-concepts among secondary school pupils.** *Educational Research*, 1974(Nov), Vol 17(1), 41-47.—Approximately 500 1st-yr pupils in 20 secondary schools were divided by teachers into groups designated as well adjusted, maladjusted, or as having appeared before a court, and were tested for self-concept by a semantic differential scale. There was little difference in the self-evaluation of the 3 groups, but as seen by others, delinquents rated themselves less favorably than maladjusted pupils, and maladjusted pupils less favorably than well adjusted pupils. Scales differentiating well adjusted pupils from both deviant groups were "unsuccessful-successful," "bad-good," and "masculine-feminine." Scales differentiating delinquents were "soft-hard," "cruel-kind," and "dirty-clean."—J. B. Francis.

Special & Remedial Education

1513. Azrin, N. H. & Powers, M. A. (Anna State Hosp, Behavior Research Lab, IL) **Eliminating classroom disturbances of emotionally disturbed children by**

positive practice procedures. *Behavior Therapy*, 1975(Jul), Vol 6(4), 525-534.—Emotionally disturbed children frequently behave in a disruptive manner in the classroom. The positive practice principle was evaluated as a method of eliminating such disruptions by requiring the child after a disruptive episode to engage in the positive action of asking for permission to speak out or to leave his seat. Ss were 6 7-11 yr old boys. The result was that disruptive actions decreased by 95% when the practice requirement was delayed and by 98% when it was immediate. By comparison, disruptive actions were at a high level during a reminder and disapproval procedure, and the disruptions were reduced by only 60% by a loss-of-recess penalty procedure. The principal advantage of the positive practice procedure over the alternative methods was its reeducative value as well as its greater effectiveness. (29 ref)—*Journal abstract*.

1514. Bray, D. Anne & Wilton, Keri M. (U Canterbury, Christchurch, New Zealand) **Classroom behaviour of intellectually handicapped children and their teachers.** *Australian Journal of Mental Retardation*, 1975(Jun), Vol 3(6), 154-161.—Classified the classroom behavior of 16 9-18 yr old intellectually handicapped children from 4 special education classrooms in terms of content and appropriateness (according to teacher demands) and the teachers' responses to the children's behavior. Ss showed high levels of appropriate behavior, although the teachers' interaction with the children was relatively infrequent. Results are discussed in terms of the desirability of incorporating data on program content in conjunction with pupil characteristics in subsequent evaluations of special educational provisions for intellectually handicapped children.—*Journal abstract*.

1515. Diamond, Hannah. (U Wisconsin, Milwaukee) **An investigation of the efficacy of Piaget curricular elements integrated into a traditional Head Start program.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 167-168.

1520. Hamilton, James L. (U Missouri, Columbia) Application of the learning potential paradigm to severely mentally retarded adolescents. *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1152-1153.
1521. Hampe, Edward. (U Louisville Medical School) Parents' and teachers' perceptions of personality characteristics of children selected for classes for the learning disabled. *Psychological Reports*, 1975(Aug), Vol 37(1), 183-189.—Clinical observation of children in classes for learning disabled raises the suspicion that children are selected for such a class not only because of their learning problems but also because they are regarded as hard to manage. Evidence from this study of 43 5-13 yr old disabled children suggests that their 8 teachers and their parents focus not only on academic performance, but also on activity level, impulse control, attention span, and freedom from distractibility in nominating children for such classes. Data were obtained from the Louisville Behavior Checklist (parents) and the School Behavior Checklist (teachers). These teachers did discriminate emotionally disturbed children from learning disabled children.—*Journal abstract*.
1522. Hannaford, Alonzo E.; Simon, Judith & Ellis, Dorothy. (Western Michigan U) Criteria for special class placement of the mildly retarded: Multidisciplinary comparison. *Mental Retardation*, 1975(Aug), Vol 13(4), 7-10.—Investigated factors employed by different groups of professionals in determining eligibility for special class placement for the mildly retarded, using multiple regression and stepwise regression analyses. Data for a hypothetical group of 25 students were submitted to 4 groups of professionals for special class placement ranking. Special education administrators, school diagnosticians, regular class teachers, and special class teachers totaling 75 individuals were sampled. Results indicate a high degree of predictability of special class rankings was possible for all 4 groups.—*Journal abstract*.

1529. Pilley, John; Harris, Chrys; Miller, John & Rice, Donadrian. (Wofford Coll) Correlations of scores on the Wechsler Intelligence Scale for Children and Peabody Picture Vocabulary Test for adolescents in a special education program. *Psychological Reports*, 1975(Aug), Vol 37(1), 139-144.—Administered the WISC and the Peabody Picture Vocabulary Test (PPVT) to 159 socioeconomically deprived Black 12-15 yr olds in a special educational setting. Analyses yielded no significant differences between the Verbal and Performance sections of the WISC, and there were no distinctive subtest profiles discernible. Intercorrelations of the WISC subtests were similar to those reported in the test manual. While the obtained mean PPVT IQ closely approximated the mean WISC IQ, intercorrelations between the PPVT IQ and the WISC Full Scale, Verbal, and Performance IQs were relatively low. A statistical test showed a clear cumulative age deficit. (32 ref) —*Journal abstract*.
1530. Quatroche, Thomas J. (Pennsylvania State U) Differences in perceived institutional functioning and responsiveness to change as related to types of students in selected four-year colleges. *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1104-1105.
1531. Reynolds, Maynard C. (U Minnesota) More process than is due. *Theory into Practice*, 1975(Apr), Vol 14(2), 61-68.—Reviews and criticizes current procedures and programs designed to implement special education. Legislative directives mandating optimal educational treatment for handicapped children are noble but often result in programs which fail due to the tendency for state and local agencies to produce (a) excessive and legalistic procedures governing admission procedures and operation of programs, (b) little assistance in developing functional programs needed for instructional treatment at the classroom level, and (c) emphasis upon correct diagnosis of learning disabilities in centers remote from the classroom environment. The development of public education, teacher current demonstration centers, and technical assistance programs is recommended as an alternative to current regulatory approaches. Diagnosis in the classroom environment, via performance-based testing toward effective instructional treatment, is advised.—*H. P. Cole*.

1533. Ronal, Jean A. (U Minnesota, Inst of Child Development) **Deaf children: Language development and education.** *Psychologica Belgica*, 1975, Vol 15(1), 63-74.—Discusses problems of language development and language teaching of deaf children. Empirical data favoring oral-manual methods are reviewed. Attempts are made to determine whether the superiority of this method is due to the use of visual modality or to the larger amount of stimulation reaching the deaf at the same time in oral-manual programs. The extension of teaching of standardized forms of sign language to hearing children concomitantly with their learning of oral language is proposed; this, it is argued, would help hearing children who have difficulties in developing and structuring their oral languages. The fact that early in their life deaf children communicate by signs, together with the recognition of sign languages in the fullest sense, is discussed in retrospective examination of conclusions drawn from recent developmental studies in cognition. Structural similarities and differences between American sign language and natural oral languages are considered. Preliminary data on the acquisition of sign language are mentioned. (42 ref)—*Journal abstract*.

1537. Shaw, Stan F. & Gillung, Tom B. (U Connecticut) **Efficacy of a college course for regular class teachers of the mildly handicapped.** *Mental Retardation*, 1975(Aug), Vol 13(4), 3-6.—Current litigation, state laws, and changing educational practices throughout the country require regular classroom teachers to become increasingly involved with mildly handicapped children. A study was conducted which attempted to assess the effectiveness of a college course in improving the attitude of regular classroom teachers toward maintaining mildly handicapped children in their classrooms. Ss were 10 such teachers enrolled in a 6-wk summer course. The Rucker-Gable Educational Programming Scale was administered before the course began, at the end of the course, and 3 mo after the course had ended to control and contrast groups on a pretest basis. None of the differences in scores was significant. (16 ref)—*Journal abstract*.

(Washington Junior High School, Brainerd, MN) **How community agencies perceive a senior high school guidance program.** *Pupil Personnel Services Journal*, 1975, Vol 4(1), 35-40.—Studies the relationship between the guidance program of the public senior high school and the community service personnel in a small central Minnesota city. A total of 54 community service agents were surveyed. Results are discussed and suggestions for further research are provided.—*R. W. Covert.*

1572. Harris, Janice L. (Coll of William & Mary) **Counselor reputation and previous performance as an influence upon counselee interaction and attitude in a group experience.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1080-1081.

1573. Harvey, T. J. (U Bath, England) **Some thoughts on norm-referenced and criterion-referenced measures.** *Research in Education*, 1975(May), No 13, 79-86.—Discusses the differences between norm- and criterion-referenced testing measures. The applicability of each is noted, with norm-referenced measures most useful when differences are being sought, and criterion-referenced measures most appropriate when performance relative to absolute standards is being considered. The increased use of criterion-referenced measures in evaluation and course assessment is encouraged. (17 ref)—*R. Tomasko.*

1574. Healy, Peter J. (Fordham U) **Comparison of the effectiveness of parental involvement in group counseling with peer group counseling in the seventh and eighth grades.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 171-172.

1575. Hwang, Chien-hou. **The application of the sentence completion method in junior high schools in Taiwan.** *Bulletin of Educational Psychology*, 1973(Jun), Vol 6, 121-132.—Investigated the applicability of sentence completion as a personality assessment technique in junior high schools in Taiwan. A Chinese Sentence Completion Test (CSCT) was developed and administered to 449 junior high school students, equally divided by sex. Results show that (a) the interscorer reliability

was satisfactory (.82); (b) the test was moderately correlated with teachers' ratings on general adjustment and with the Neurotic scale of the Maudsley Personality Inventory; (c) the mean scores for boys and girls were comparable. Advantages of using the sentence completion method in schools, and suggestions regarding its application, are discussed. Further study is needed to establish a cutting score for the discrimination of the well adjusted and the maladjusted. (Chinese summary)—*Journal summary.*

1576. Joesting, Joan. (Salisbury State Coll) **Test-retest reliabilities of State-Trait Anxiety Inventory in an academic setting.** *Psychological Reports*, 1975(Aug), Vol 37(1), 270.—Administered the State-Trait Anxiety Inventory to 124 undergraduates before and after a previously announced classroom examination. A significant difference was found between the 2 administrations in A-State, a transitory emotional state, while A-Trait, a stable individual difference, remained almost the same.

1577. Jones, Thomas D. (U Southern California) **A measurement of social maturity for the educable mentally retarded high school student.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 640.

1578. Kaur, Rajinder. (U Pennsylvania) **Evaluation of the science process skills of observation and classification.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 186.

1579. Krus, David J.; Weidman, John C. & Bland, Patricia C. (U Southern California, Los Angeles) **SSIE: Semiprojective scales of institutional evaluation.** *Research in Higher Education*, 1975, Vol 3(2), 131-138.—The Semiprojective Scales of Institutional Evaluation (SSIE), measuring positive and negative connotations of an educational institution, were developed together with 10 predictor scales pertaining to students' personal and organizational orientations. The SSIE scales were developed by order analysis. This method of multidimensional analysis allows for gradation of sensitivity with respect to underlying dimensions of the data matrix. The predictor scales were developed by a theoretical strategy and regressed on the 4 SSIE scales. Both the SSIE and predictor scales were administered to 92 undergraduates. The interrelations between these measures suggest that favorable images of the college environment are likely to result when the institution provides a balance of general knowledge and specific skills, moderates student participation in academic governance, and accommodates individual differences. (15 ref)—*Journal abstract.*

1580. Leslie, Perry T. (U British Columbia, Canada) **Selected linguistic skills in young deaf children.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 640.

1581. Levin, Gerald R.; Henderson, Bruce; Levin, Adrienne M. & Hoffer, Gilbert L. (Bucknell U) **Measuring knowledge of basic concepts by disadvantaged preschoolers.** *Psychology in the Schools*, 1975(Apr), Vol 12(2), 132-139.—Summarizes 1 method of appraising how well disadvantaged preschoolers comprehend a set of concepts that appear to be basic in successful school performance. The method is based on a modification of the Boehm Test of Basic Concepts. The modified test is designed to function both as a norm-referenced and as a criterion-referenced instrument. The data indicate that

the modification is convenient and useful for programs with disadvantaged children.—*H. Kaczowski.*

1582. Linn, Robert L.; Centra, John A. & Tucker, Ledyard. (U Illinois) **Between, within, and total group factor analyses of student ratings of instruction.** *Multivariate Behavioral Research*, 1975(Jul), Vol 10(3), 277-288.—Compared the factor structures of student ratings of instruction resulting from total group, between group, and within group analyses. 6 factors obtained from responses by 9,700 students to 31 items of the Student Instructional Report were used to approximate the between group covariance matrix based on 437 classroom means and the pooled within classroom covariance matrix. A good approximation to both the between and within group covariance matrices was obtained.—*Journal abstract.*

1583. Litherland, Ronald. (Moorhead State Coll) **The re-education of a counselor educator.** *Pupil Personnel Services Journal*, 1975, Vol 4(1), 27-28.—Reviews an individual counselor-educator's experiences in counseling situations over a year's sabbatical leave.—*R. W. Covert.*

1584. Mackworth, Jane F. (Radcliffe Inst, Los Gatos, CA) **A new reading test for Grade 1.** *Bulletin of the Psychonomic Society*, 1975(Aug), Vol 6(2), 143-145.—Designed and validated a new matching and coding test for diagnosing reading ability at the end of Grade 1. The test presents pairs of letters or words projected on a screen. The child is asked to decide whether the 2 items sound the same or different. 70 1st graders aged 6.6 to 8.0 yrs were tested. The correlation between error scores on the coding test and Gray oral reading scores was $-.8$. Errors ranged from 0% to 61%, and reading scores ranged from 0 to 37 (grade levels of 1.1 through 4.3). Ss judged a pair by appearance when they could not sound out the words. There were 49% errors on sound-alike pairs and only 20% errors on different pairs. Most different errors involved confusion between D and b. The central process of learning to read involves learning the various graphemes that may represent each sound.—*Journal abstract.*

1585. Malone, Charlotte E. (Western Behavioral Sciences Inst, San Diego, CA) **Potential abilities: To preserve and to enhance.** *Gifted Child Quarterly*, 1975(Sum), Vol 19(2), 161-163.—Describes a method of identifying nonwhite young gifted children through behavioral indices (the Behavioral Identification of Gifted—BIG). The BIG method employs CHAROSEL, a restricted computer program developed by the Navy to discriminate between any 2 or more dichotomies in a parameter.—*J. C. Gowan.*

1586. Margro, Arthur L. (Fordham U) **The effectiveness of peer-led and adult-led group counseling of behavioral problem girls in a middle school.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 137.

1587. McCook, William M. (U Connecticut) **Predicting potential dropouts in the inner-city: The development of an attitude scale.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 174.

1588. McLeod, John. (U Saskatchewan, Inst of Child Guidance & Development, Saskatoon, Canada) **Uncertainty reduction language through reading comprehension.** *Journal of Psycholinguistic Research*, 1975(Oct), Vol 4(4), 343-355.—In an exploratory study into the feasibility

of constructing a multilingual reading comprehension test, parallel cloze tests were constructed in Czech, English, French, German, and Polish. A total of 484 8-14 yr olds were tested on the version in their native languages. Test performance was assessed by means of a method which estimates the child's "contribution" to overall language redundancy. Results suggest that the method is both reliable and valid and has potential for the assessment of bilinguality of reading comprehension.—*Journal abstract.*

1589. Moore, Jean B. (U Illinois, Urbana-Champaign) **[Mentally disturbed juvenile arsonists.]** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 641.

1590. Moore, Kathryn M. (Cornell U, Coll of Agriculture & Life Sciences) **The cooling out of two-year college women.** *Personnel & Guidance Journal*, 1975(Apr), Vol 53(8), 578-583.—Parents, uncontrollable circumstances, counselors, and the 2-yr college itself are examined as agents in the cooling-out process with women. The process is described as the reconciliation of aspirations and abilities "to avoid conflict created by disappointment and feelings of failure."—*G. S. Speer.*

1591. Morgan, Ronald R. (Loyola U) **Prediction of college achievement using the need achievement scale from the Edwards Personal Preference Schedule.** *Educational & Psychological Measurement*, 1975(Sum), Vol 35(2), 387-392.—Investigated the utility of the Edwards Need Achievement scale (nAch) for predicting achievement performance, as (a) a supplement to academic aptitude tests and (b) a predictor of over- and underachievement. Ss were 217 college students enrolled in 5 sections of a general introductory psychology course. A correlational analysis was carried out among the Edwards nAch score, American College Testing Program Examination (ACT) score, overall GPA, psychological course grade, and derived measures of over- and underachievement. From the results it is concluded that (a) little support for the use of the Edwards nAch scale as a supplement to ability test scores in the prediction of academic performance was offered, (b) the nAch scale was of little value in differentiating between over- and underachievers, and (c) further investigation is needed to evaluate a single course grade as an alternative to overall GPA as a suitable criterion of academic achievement.—*Journal abstract.*

1592. Pierce, Sterling L. (State U New York, Albany) **The effect of group discussion on statements of moral judgment of seventh graders.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1085.

1594. Roberts, Ada L. (Purdue U) **School attitude and self concept changes effected by utilizing high school students in a counseling-type relationship with potential dropouts in the elementary school.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 141.

1595. Sack, Robert T. (Purdue U) **Facilitative interpersonal behavioral skills training: Its effect on encounter group interaction.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 141.

1596. Schleuter, Stanley L. (State U New York, Buffalo) **Use of standardized tests of musical aptitude with university freshmen music majors.** *Journal of Research in Music Education*, 1974(Win), Vol 22(4), 258-269.—Data on 155 freshmen music majors indicate adequate reliability for the Aliferis Music Achievement Test, Gordon's Musical Aptitude Profile, and Iowa Tests for Musical Literacy (Levels 5 and 6). Intercorrelations within and among tests showed some overlapping between achievement tests but little relationship with aptitude test content. A wide range of information on entering college music majors may be best obtained by administering the Musical Aptitude Profile and a music achievement test with suitable content.—D. S. Higbee.

1597. Shimon, Nissim. (U North Carolina, Chapel Hill) **Development and evaluation of a model of school psychological services: A system approach.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 176-177.

1598. Shippen, Samuel J. (Texas A&M) **An investigation of vocational counseling effectiveness and its relationship to selected background and personal characteristics.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1087.

1599. Smaby, Marlowe & Anderson, Jerry. (U Minnesota, Duluth) **Educational alternatives are needed for probable dropouts.** *Pupil Personnel Services Journal*, 1975, Vol 4(1), 13-18.—Compares a program for preventing dropouts based on mutual goal-setting and action-oriented counseling with a traditional counseling program. Potential dropouts were identified according to 10 criteria and randomly assigned to the experimental and control groups. Results of the 3-mo program showed that those receiving the special counseling had a slightly lower dropout rate than those receiving normal counseling. (17 ref)—R. W. Covert.

1600. Smith, Lawrence L. (U Illinois, Urbana-Champaign) **Comparison of reading expectancy sets as determined from selected intelligence measures.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 626.

1601. Soderquist, Wesley E. (Loyola U, Chicago) **Differential effects of counseling of prospective graduates in selected junior colleges of a multi-campus urban junior college system.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1087.

1602. Spilman, Helen W. (City U New York) **The use of a single item-sample to estimate group achievement.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 177-178.

1603. Telzrow, Cathy F. (Streetsboro City Schools, OH) **The school psychologist as director of career education.** *Psychology in the Schools*, 1975(Apr), Vol 12(2), 197-199.—Reviews the type of services that a school psychologist can provide in a career education program.—H. Kaczowski.

1604. Terry, Roger L. & Woods, Margaret E. (Hanover Coll) **Effects of humor on the test performance of elementary school children.** *Psychology in the Schools*, 1975(Apr), Vol 12(2), 182-185.—Studied the effect of humorous testing materials on the performance of elementary school children. Ss were 46 3rd graders and 48 5th graders. The testing materials consisted of 4 problems: a brief paragraph followed by a short answer,

a verbally presented mathematical problem, a paragraph followed by a list of portrayed events to be ordered in proper sequence, and a 2nd mathematical problem. One set of problems was worded in a humorous fashion and the other set was worded nonhumorously. It is concluded that humor depressed 3rd grader's performance but had positive and negative effects on 5th graders' performance.—H. Kaczowski.

1605. Wallbrown, Jane D.; Engin, Ann W.; Wallbrown, Fred H. & Blaha, John. (Worthington Public Schools, OH) **The prediction of first grade reading achievement with selected perceptual-cognitive tests.** *Psychology in the Schools*, 1975(Apr), Vol 12(2), 140-149.—Investigated the relationship between selected facets of perceptual-cognitive development at the kindergarten level and reading achievement in 1st Grade. 10 predictor tests were administered to 100 kindergartners. The WETSL computer program was used to determine the regression of the reading achievement criteria on the predictor variables. Findings indicate that the battery of tests is related to reading achievement during the early primary grades. Results included the following: (a) General intelligence figured prominently in both the vocabulary and comprehension criteria. (b) Visual-motor integration of the Bender-Gestalt Test was important. (c) The vocabulary criterion was predicted with greater success than the comprehension criterion.—H. Kaczowski.

1606. Wellborn, Emily S. (U Florida) **A study of the effect of examiner race on individual intelligence test scores of Black and White children.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 195.

1607. Whitehead, Bessie M. (U Tulsa) **The experimental index: A proposed screening instrument for early identification of learning disabled students.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1157.

1608. Yom, B. Lee; Wakefield, James A. & Doughtie, Eugene B. **The psycholinguistic and conservation abilities of five-year-old children.** *Psychology in the Schools*, 1975(Apr), Vol 12(2), 150-152.—Investigated the relationship between the Illinois Test of Psycholinguistic Abilities (ITPA) and the Concept Assessment Kit—Conservation (CAK). Ss were 52 5-yr-olds entering kindergarten. The Auditory Association and Grammatic Closure subtests were significantly related to all of the conservation tests of the CAK.—H. Kaczowski.

APPLIED PSYCHOLOGY

1609. Beach, Barbara H. (U Washington, Seattle) **Expert judgment about uncertainty: Bayesian decision making in realistic settings.** *Organizational Behavior & Human Performance*, 1975(Aug), 10-59.—Reviews Bayesian research on experts' judgments about uncertainty in the real world. 6 central questions are raised concerning (a) the economic value of probability statements, (b) the use of actuarial vs subjective probabilities, (c) individual vs consensus probability assessments, (d) the role of computers in probability assessment, (e) the use of data by assessors, and (f) expertise and the training of individuals to become experts; relevant laboratory

evidence is discussed. These questions serve as a framework for reviewing the literature on experts' assessments of uncertainty in 4 separate areas of applied research—the military, meteorology, medicine, and business. (7 p ref)—*Journal abstract*.

1610. Broderick, John J. (U New Hampshire) **Law, order and the police: A study of factors that influence police attitudes.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 421-422.

1611. Cash, William B. (Purdue U) **An experimental study of the effects of five styles of appraisal interviewing upon anxiety, defensiveness, and interviewee style preference.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 442.

1612. de Sitter, L. U. (Technische Hogeschool, Eindhoven, Netherlands) [Socio-technique: II. Notes concerning a socio-technical model of a production system.] (Duth) *Mens en Onderneming*, 1974(May-Jun), Vol 28(3), 163-176.—Notes that the social-industrial theories of the past emphasized static social and axiomatic values. Today the introduction of cybernetics and general systems theory has necessitated the normative approach to the resolution of conflicts. The dynamic business model analyzes input, output, transformation, structure, organizational latitudes, and reduction of interfering operations.

1613. Juarez, Leo J. (U Kentucky) **Role strain, training shock, and culture shock: Toward the operationalization of a theory of role strain in the evaluation of adjustment and performance among a group of New Directions Peace Corps volunteers.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1176-1177.

1614. Little, Craig B. (U New Hampshire) **Stress responses among unemployed technical-professionals.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 429.

1615. Long, Gerald M.; Ambler, Rosalie K. & Guedry, Fred E. (Naval Aerospace Medical Research Lab, Pensacola, FL) **Relationship between perceptual style and reactivity to motion.** *Journal of Applied Psychology*, 1975(Oct), Vol 60(5), 599-605.—The relationship between the perceptual-style dimension of field dependence— independence, as measured by the rod-and-frame test (RFT) and the group Hidden Figures Test, and motion disturbance, as evidenced by a version of the Brief Vestibular Disorientation Test (BVDT) was investigated in 83 naval aviation students. Significant correlations were found between RFT scores and BVDT scores. Field dependence was significantly associated with disturbance by the motion stimulus of the test. Apparent contradictions of the present findings with those involving simulator sickness are discussed. (25 ref)—*Journal abstract*.

1616. Manese, Wilfredo R.; Skrobiszewski, Melitta & Abrahams, Norman M. **Attitudinal and demographic characteristics of company commanders: A comparative analysis across recruit training centers.** San Diego, CA: US Navy Personnel Research & Development Ctr, 1975. xii, 60 p.—Results of a survey of male and female US Navy company commanders show (a) significant differences across the 3 centers in percentage of those who volunteered for commander duty, length of service, and number of companies

trained; (b) responses from females which were consistently different from those of males; and (c) agreement across respondents concerning administrative difficulties, poor quality of recruit input, and recruit discipline.

1617. Pieper, William J. & Benson, Philip G. (Applied Science Assoc, Valencia, PA) **Simulation design manual for the EC-II simulator.** *US AFHRL Technical Report*, 1975(May), No 75-14, 48 p.—Presents an aid for developing simulation models (faceplate, slide disc visuals, and programs) for the EC-II programmable simulator. Guidance is provided for the design of the basic instructional program, including collection and organization of materials and information used to develop the model, panel design data, program information, and program logic expressions.

1618. Schoenfeldt, Lyle F. & Gatewood, Robert D. (U Georgia) **Industrial and organizational psychology through the looking glass of the Division 14 dissertation contest.** *Personnel Psychology*, 1974(Win), Vol 27(4), 543-554.—Examined the 18 entrants to the 1972-1973 dissertation contest of the Industrial and Organizational Division (Division 14) of the American Psychological Association to determine major characteristics and to relate these to new directions envisioned as appropriate for industrial/organizational research. Results demonstrated (a) concentration on organizational/social topics, particularly the area of attitude formation; (b) preferences for utilizing Ss from multiple levels of diverse types of organizations; (c) heavy reliance on paper-and-pencil procedures for gathering data; and (d) an even split between field and laboratory research. There was notable agreement between writers on the future directions of research and the dissertation entrants; however, a number of issues that seem to be pressing to modern society were missing from the dissertation themes.—*Journal summary*.

1619. Sung, Yong H. (Purdue U) **Effects of attitude similarity and favorableness of information on Bayesian decision making in a realistic task.** *Journal of Applied Psychology*, 1975(Oct), Vol 60(5), 616-620.—59 undergraduates assuming the role of bank-loan committee member, rated loan applicants as to probability of delinquency in loan repayment, and recommended loan magnitudes. Ss (a) expressed greater attraction to applicants with similar attitudes and to applicants with good credit ratings; (b) displayed less conservatism (the difference between the rated delinquency probability and the optimal probability of Bayes's theorem) under high attitude similarity and favorable conditions, and (c) approved larger loans for similar applicants than dissimilar ones.

Occupational Attitudes & Interests & Guidance

1620. Bratfisch, Oswald & Larsson, Tore. (U Stockholm, Inst of Applied Psychology, Sweden) **Perception of occupations: Estimated difficulty and stated interest.** *Reports from the Institute of Applied Psychology, U Stockholm*, 1974, No 54, 8 p.—25 male and 25 female high school students, with supposedly no real work experience, were presented with 20 occupational titles and asked to estimate, using pair comparison, the difficulty of carrying out each profession. Ss were also asked to state, in the same way, their interest in the same

20 occupations. Results show that the 2 variables were largely linearly related to each other, the coefficient of correlation being 0.84 and 0.49 for males and females, respectively. When excluding 4 predominant male occupations from the data of the females, the coefficient of correlation increased to 0.73. Thus, a sex-bias was demonstrated. A high conformity between the males' and females' opinions about occupational difficulty and their stated interest in the occupations was also observed. The possible practical impacts of the result for vocational guidance are briefly discussed and future research on the topic is outlined. (25 ref)—*Journal abstract*.

1621. Florence, John W. (U Tulsa) **A further investigation of Holland's theory of vocational psychology.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1076.

1622. Glenn, Norval D. (U Texas, Austin) **The contribution of white collars to occupational settings.** *Sociological Quarterly*, 1975(Spr), Vol 16(2), 184-189.—A regression analysis of the 1947 and 1963 NORC occupational prestige scores for 45 occupations found that being white-collar may have contributed modestly to the prestige of the 24 nonmanual occupations in 1947, net of economic rewards and educational selectivity, but that any such effect had largely disappeared by 1963. Findings tend to support the view that the white-collar-blue-collar distinction has become less important in American society.—*Journal abstract*.

1623. Gough, Harrison G. (U California, Inst of Personality Assessment & Research, Berkeley) **Strong Vocational Interest Blank profiles of women in law, mathematics, medicine, and psychology.** *Psychological Reports*, 1975(Aug), Vol 37(1), 127-134.—Obtained male form SVIB protocols from 4 female samples: 40 law students, 44 mathematicians, 51 medical students, and 49 graduate students in psychology (mean ages = 24.6, 40.3, 22, and 23.6 yrs, respectively). Each sample scored significantly higher than the complement (other 3 samples pooled) on the appropriate occupational scale. Classificatory indices were defined for each sample, adding scores on 4 scales with positive differences and subtracting 4 with negative; no scale was used twice. Analyses of variance were significant ($p < .01$) for each index. The accuracy of each index in correctly assigning individuals to the designated occupation was also examined. Obtained vs chance hit rates were 78% vs 78% (law), 85% vs 76% (mathematics), 78% vs 72% (medicine), and 75% vs 73% (psychology).—*Journal abstract*.

1624. Grusky, Oscar. (U California, Los Angeles) **Career patterns and characteristics of British naval officers.** *British Journal of Sociology*, 1975(Mar), Vol 26(1), 35-51.—Mailed a questionnaire to 484 officers of the British Royal Navy stationed in England in 1967, to determine whether there has been a change in the social origins of such officers. Higher ranking Ss were from upper socioeconomic family backgrounds. They were more likely than lower ranking officers to have received a public school education and to have been positively influenced by their family in choosing a military career. The higher ranks were less likely than lower ranking Ss to have had experience as enlisted men and to give "careerist" reasons for selecting the naval profession. It is suggested that the British navy will become less elitist

and more representative of British society as younger and lower ranking officers are promoted.—*R. P. Abeles*.

1625. Kelley, Hubert A. (U Southern California) **Effects of military experience on socialization of Vietnam era veterans to work roles.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 866.

1626. Kronus, Carol L. (U Illinois, Urbana) **Occupational values, role orientations, and work settings: The case of pharmacy.** *Sociological Quarterly*, 1975(Spr), Vol 16(2), 171-183.—The theoretical model positing that the occupational institution of business is based on pecuniary and extrinsic values while professions are predicated on altruistic service values was tested, using the case of pharmacy. Data were obtained from 53 pharmacists in 22 organizations in a midwest urban area, including 18 hospital pharmacists, 20 community retail pharmacists, and 15 chain store retail pharmacists. Using E. R. Quinney's (1964) index, pharmacists with business-role orientations were compared with those favoring a professional-role stance in terms of their occupational values: Results contrary to the model were found. Pharmacists, regardless of role orientation, were similarly motivated by service and income values. When the work setting was taken into account, altruism predominated in the business settings, and prestige and income value were deemed less important as compared to the hospital-clinic. Revisions of the theoretical model are suggested.—*Journal abstract*.

1627. Nafziger, Dean H. (New Mexico State U) **A Markov chain analysis of the movement of young men using the Holland occupational classification.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 138-139.

1628. Retts, William L. (Arizona State U) **The effect of interview training on the non-possessive warmth of employment interviewers.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1085-1086.

1629. Singh, Ramadhar. (Indian Inst of Technology, Kanpur) **Information integration theory applied to expected job attractiveness and satisfaction.** *Journal of Applied Psychology*, 1975(Oct), Vol 60(5), 621-623.—128 engineering students rated 8 job descriptions according to how much they would like to accept the job and how satisfied they would feel with that job. The prediction that plots of the context (row) factor (e.g., salary) data across the 2 levels of the content (column) factor (e.g., nature of the task) should appear as separate parallel curves was confirmed, supporting information integration theory.

Personnel Selection & Training

1630. American Psychological Assn, Div of Industrial-Organizational Psychology. (Washington, DC) **Principles for the validation and use of personnel selection procedures.** Dayton, OH: APA Industrial-Organizational Psychologist, 1975. iv, 19 p. \$1.—Outlines the principles adopted by the Division of Industrial-Organizational Psychology of the American Psychological Association for the use of valid selection procedures and principles upon which personnel research may be based, as guidance for practitioners conducting validation, and for interpretation by personnel managers and others responsible for implementing validation efforts.

1631. Ayers, George W. (Tulane U. School of Social Work) **Work training program participants' perceptions of the personal usefulness of their program as compared with their program performance.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1362.
1632. Cohen, Stephen L. & Bunker, Kerry A. (U South Florida) **Subtle effects of sex role stereotypes on recruiters' hiring decisions.** *Journal of Applied Psychology*, 1975(Oct), Vol 60(5), 566-572.—Asked 150 male job recruiters from 2 university placement officers to evaluate relevant employment materials on 1 hypothetical job applicant (male or female) for either a male-oriented (personnel technician) or female-oriented (editorial assistant) position to make a hiring decision. Results indicate that hiring decisions were not influenced independently by the applicant's sex or position for which he/she was applying, but rather by the interaction of the 2 variables. That is, significantly more females than males were recommended for hiring for the editorial assistant position, while significantly more males were recommended for the personnel technician job. Post-hoc analyses revealed different trait patterns attributed to applicants recommended for hiring based on their sex-job role congruence. Implications for further research relating to personnel-related decisions are discussed. (15 ref)—*Journal abstract*.
1633. Edcl, Eugene C. & Jacoby, Jacob. (Purdue U) **Examiner reliability in polygraph chart analysis: Identification of physiological responses.** *Journal of Applied Psychology*, 1975(Oct), Vol 60(5), 632-634.—Studied the degree of reliability displayed by 10 experienced polygraph examiners when identifying, as opposed to interpreting, physiological responses. Responses to 2,530 questions from 40 polygraph interview cases show a high degree of consistency in the ability of these examiners to identify (a) whether a physiological reaction occurred and, if so, (b) what type of physiological pattern occurred.
1634. Galbreath, Judith A. (Syracuse U) **An investigation of tolerance for ambiguity and attitudes toward the disabled under conditions of varied stimulus and situational ambiguity.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1152.
1635. Gavin, James F. & Hamilton, John W. (Colorado State U) **Selecting police using assessment center methodology.** *Journal of Police Science & Administration*, 1975(Jun), Vol 3(2), 166-176. Reviews psychological police selection techniques in use in the US and describes the current multiple assessment strategy of Fort Collins and Colorado State University. This strategy consists of certain standard psychological tests, traditional police selection methods, and real-life simulated situations in which recruits role-play. The dimensions of performance assessed are given, along with the advantages and disadvantages of this selection strategy.—*R. J. Albers*.
1636. Gibson, Frank K. & Yeager, Samuel. (U Georgia) **Trends in the federal employment of Blacks.** *Public Personnel Management*, 1975(May-Jun), Vol 4(3), 189-195.—Examines the employment of Blacks in the classified segment of the federal government. Data are for the years 1960, 1962, and 1970, and include overall Black-White employment in the federal government, the regional breakdown, and the breakdown by grade level. Although progress has been made toward equity in federal employment of Blacks, the largest numbers are still found in the lowest level of positions.—*S. Benier*.
1637. Gjerdt, A. (Geodüstina, narodni podnik, Prague, Czechoslovakia) [Data on selection and follow-up of a small group, working in conditions of natural stress in an expedition abroad.] (Czech) *Ceskoslovenska Psychiatrie*, 1974(Jun), Vol 70(3), 200-202.—Used psychological tests, questionnaires, sociometric measurement, interviews, and observation in selecting 9 out of 22 applicants for a geological expedition to a Mongolian taiga. After 10 mo the participants were re-examined. Findings showed that (a) the scientific selection succeeded in creating a homogenous group without interpersonal conflicts (but 2 of the geologists did not accept a 2nd year assignment to Mongolia); (b) contrary to expectations, social isolation, sexual deprivation, and influence of the climate were not significant stressors; (c) most of the determinants influencing the life of the members of the expedition were connected with their individual personality dispositions and characteristics.—*V. Fischman*.
1638. Guinn, Nancy; Johnson, Allan L. & Kantor, Jeffrey E. **Screening for adaptability to military service.** *US AFHRL Technical Report*, (May), 29 p.—Administered a history opinion inventory (HOI) to 15,252 basic airmen during basic military training. The service careers of these Ss were monitored for 2 yrs in order to assess the ability of the HOI to predict the criterion of in-out of service. As a priori adaptation index developed from HOI items correctly identified as high risk 23% of those Ss discharged from service during the 2-yr period, while incorrectly labeling as high risk only 6% of those Ss still in service after 2 yrs. The possibility of increasing the accuracy of prediction by using biographic-demographic data and the operational usefulness of the HOI are discussed. (24 ref)—*Journal abstract*.
1639. Leavitt, Albert. (New York U) **Alienation and self-esteem: Effects of a work-related training program.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 873.
1640. Mathews, J. J.; Cobb, B. B. & Collins, W. E. (FAA Civil Aeromedical Inst, Aviation Psychology Lab, Oklahoma City, OK) **Attitudes on En Route air traffic control training and work: A comparison of recruits initially trained at the FAA Academy and recruits initially trained at assigned centers.** *FAA Office of Aviation Medicine Report*, 1975(May), No 75-3, 36 p.—225 trainees who represented groups of attritions and retentions in 2 En Route air traffic control training programs responded to questionnaires that examined aspects of training-related and work-related attitudes. Generally, the work attitudes were positive for attritions and retentions of both sexes. Academy instructors and Academy training received very high ratings from all groups of Ss. Most Ss in both the Academy-trained and the facility-trained groups felt that Academy training should precede facility training. Ss' recommendations for change in the program are discussed. In telephone interviews with 99 attritions, 83% indicated that they would again consider FAA employment and 68% said that they would consider reapplying for air traffic control work.—*W. E. Collins*.

1641. McCluskey, Michael R. & Tripp, James M. **An evaluation of the utilization, maintenance, and perceived benefits of the Training Extension Course (TEC).** *HumRRO Technical Report*, 1975(Jun), No 75-18, 135 p.—Conducting a study to evaluate the Training Extension Course's (TEC) implementation program, providing the military sponsoring agency data with which to identify alternative actions for improving the implementation, management, and distribution of TEC on an Army-wide basis. The evaluation effort used questionnaires, interviews, maintenance forms, and a utilization form to obtain data which might make the distribution more effective. Initial distribution of TEC materials was limited to a select group of Active Army and Reserve Component units. A survey of these units indicated that the TEC system would probably have to be promoted, demonstrated, and "sold" to Unit Training Officers—Noncommissioned Officers. The development of a prototype training program incorporating TEC, the establishment of a system of incentives, and an increase in the basis of issue of TEC hardware and software are suggested.—*Journal abstract.*

1642. McGuirk, Frank D.; Pieper, William J. & Miller, Gary G. (Applied Science Assoc, Valencia, PA) **Operational tryout of a general purpose simulator.** *US AFHRL Technical Report*, 1975(Jun), No 75-13, 50 p.—Evaluated the operational effectiveness of a general purpose simulator (GPS) in a technical training course. GPS, in this context, refers to a computer-based, programmable device that can be rather easily modified with varying levels of fidelity. A simulation model was designed for use in instructing students in checkout and troubleshooting procedures for a sophisticated aircraft radar system. Evaluation results from 39 airmen show that the simulator was an effective training device: (a) Training was at least as adequate as training received on an actual equipment trainer (AET) used in the course. (b) The simulator was much less expensive and more reliable than the AET. (c) The simulator had the additional capability of training troubleshooting tasks.—*Journal abstract.*

1643. Melching, William H. & Larson, Susan M. **Improving the classroom performance of Army instructors.** *HumRRO Technical Report*, 1975(May), No 76-6, 63 p.—Using a previous report which suggested characteristics of effective teaching as a guide, procedures and materials for training US Army instructors to improve their classroom effectiveness were developed. This report elaborates on the activities and experiences an instructor would undertake to acquire or update the skills described in the model. The main emphasis is on description of recommended activities to be undertaken in connection with the performance of each instructor task cited in the model.—*Journal abstract.*

1644. Nickerson, R. S. & Feehrer, C. E. (Bolt Beranek & Newman, Inc, Cambridge, MA) **Decision making and training: A review of theoretical and empirical studies of decision making and their implications for the training of decision makers.** *NAVTRAEQUIPCEN*, 1975(Aug), No 73-C-0128-1, 210 p.—Reviews studies of decision making (conceptualized as a type of problem solving) in terms of the following component tasks: information gathering, data evaluation, problem struc-

turing, hypothesis generation, hypothesis evaluation, preference specification, action selection, action selection, and decision evaluation. Implications of research findings for training are discussed in the context of descriptions of each of these tasks. It is concluded that decision making is not sufficiently well understood to permit the design of a general-purpose training system for decision makers. Systems and programs could be developed, however, to facilitate training with respect to specific decision-making skills. The development of more generally applicable training techniques or systems should proceed in an evolutionary fashion. Decision-aiding techniques currently being studied are discussed.—*Journal abstract.*

1645. Robertson, D. W. & Royle, M. H. **Comparative racial analysis of enlisted advancement exams: Item-difficulty.** *US Navy Personnel Research & Development Center Technical Report*, 1975(Jul), No 76-6, 41 p.—Conducted an item analysis of 24 Navy enlisted advancement examinations to determine which test characteristics might account for the higher promotion rate of White than Black groups. Specific questions asked included (a) whether it is feasible to construct examinations containing only items which are similar in difficulty for both Blacks and Whites, (b) what types of items are similar in difficulty, and (c) whether the same items are relatively easy or difficult for Blacks and Whites. The proportion of items identified as similar in difficulty for both Blacks and Whites varied from about 1/5 to 1/2 of the 150 items in each test. The similar-type items were concentrated in the difficult range and presented applied, rather than conceptual, content. Relative item difficulty was low on some exams. The development of examinations of items similar in difficulty for Blacks and Whites could not be recommended; the concentration of similar-difficulty items in the difficult range would degrade test quality, and items largely limited to factual content might not cover all necessary content for a particular occupational specialty.—*Journal abstract.*

1646. Smode, Alfred F. & Lam, Karen D. (Eds.). (Training Analysis & Evaluation Group, Orlando, FL) **Military instructor training in transition.** *Training Analysis & Evaluation Group Report*, 1975(May), No 25, 176 p.—Presents a series of papers given at a US Naval conference of individuals involved in instructor training in the military services, industry, and academia. Areas discussed include a sampling of instructor training in today's military environment, plans and programs of the immediate future and qualitative changes projected for the next generation instructor training system, and concepts relevant to long-range planning for instructor training. (40 ref)—*Journal abstract.*

1647. Suchman, J. Richard; Kubala, Albert L. & Taylor, John E. **The development of an open-access, performance oriented curriculum for training the military policeman (MOS 95B20).** *HumRRO Final Report*, 1975(Jun), No 75-9, 63 p.—In a project undertaken to revise the Basic Law Enforcement Course (BLEC) offered by the US Army Military Police School at Fort Gordon, an individualized open-access curriculum was developed through a combination of systems engineering, group problem-solving, and peer instruc-

tion. Results of a trial run of the new instructional system with 51 BLEC students show (a) the feasibility of group problem-solving and informal peer instruction for systems engineering, (b) the feasibility of an individualized open-access learning system for BLEC, (c) a strongly favorable attitude toward the new course on the part of the instructors and students, and (d) superior levels of student performance compared to those of students trained under traditional classroom methods.—*Journal abstract.*

1648. Timmins, William M. (Brigham Young U) **Utah's IPA Center: Report on cooperative recruitment and selection.** *Public Personnel Management*, 1975(May-Jun), Vol 4(3), 156-159.—Describes the Utah Intergovernmental Personnel Agency Center which was started in December 1972 to provide a combined examining program for city, county, state, and federal jobs for clerical workers within the area. Positive and negative aspects are detailed; the overall results are considered positive.—S. Bowser.

1649. Young, Douglas L. & Taylor, John E. **Development, field test, and refinement of performance training programs in armor advanced individual training.** *HumRRO Final Report*, 1975(Jun), No 75-8, 39 p.—Inventoried a total of 115 tasks in 2 US Army advanced individual training programs—Armor Reconnaissance Specialist (MOS 11D) and Armor Crewman (MOS 11E). The inventories were reduced by eliminating those tasks which are not required for entry-level duty performance, and performance objectives were written for tasks that could be feasibly trained. These performance objectives were translated into performance measures and tests. Field test, data collection, and refinement of the 2 training programs extended over 10 successive training cycles for 11D ($N = 1,000$) and 14 successive training cycles for 11E ($N = 2,000$). Programs were refined on the basis of observation of instruction, results of formal performance examinations, and attitude indicators. The final programs resulted in high trainee proficiency levels and favorable trainee and instructor attitudes.—*Journal abstract.*

Personnel Evaluation & Performance

1650. Asher, James J. & Sciarrino, James A. (San José State U) **Realistic work sample tests: A review.** *Personnel Psychology*, 1974(Win), Vol 27(4), 519-533.—Reviewed validity coefficients for a wide sample of motor and verbal work sample tests which were designed to measure on-the-job criterion behavior. Motor tests had higher validities than verbal tests when job proficiency was the criterion, but this pattern was reversed when success in training was the criterion. These validities were somewhat lower than those for biographical information but higher than those for other predictors. A number of explanations for these findings are discussed. (4½ p ref)—J. McKillip.

1651. Bernardin, H. John & Alvares, Kenneth M. (Bowling Green State U) **The effects of organizational level on perceptions of role conflict resolution strategy.** *Organizational Behavior & Human Performance*, 1975(Aug), Vol 14(1), 1-9. Hypothesized that discrepant ratings of leadership effectiveness from organizational levels above and below the 1st-line supervisory

level were a function of discrepant perceptions of crucial supervisory behavior. Ss were 129 employees of a large midwestern manufacturing company—general foremen, 1st-line supervisors, and subordinates. Results indicate that perceptions of role conflict resolution strategies were a function of organizational level and conflict type. (15 ref)—*Journal abstract.*

1652. Borman, Walter C. & Dunnette, Marvin D. (Personnel Decisions Research Inst, Minneapolis, MN) **Behavior-based versus trait-oriented performance ratings: An empirical study.** *Journal of Applied Psychology*, 1975(Oct), Vol 60(5), 561-565.—23 US Navy officer raters evaluated the performance of subordinate officers using (a) behaviorally anchored scales, (b) scales containing the same dimensions and definitions but without behavioral anchors, and (c) a series of scales involving trait-oriented dimensions, also without anchors. Comparisons of the formats' psychometric properties indicated that the behaviorally anchored scale format was somewhat superior to the other 2 on 3 of 4 dependent variables (involving estimates of leniency, halo, interrater agreement, and degree of differentiation among rates). However, the magnitudes of the differences due to formats were small, in no case exceeding more than 5% of the variance on the dependent variable.—*Journal abstract.*

1653. Borman, Walter C. (Personnel Decisions Research Inst, Minneapolis, MN) **Effects of instructions to avoid halo error on reliability and validity of performance evaluation ratings.** *Journal of Applied Psychology*, 1975(Oct), Vol 60(5), 556-560.—Investigated the effects of a short training session designed to reduce halo error in performance ratings. 90 low and middle managers rated 1 of 6 hypothetical first-line supervisors on 6 performance dimensions according to behavior displayed in a prepared vignette. Ratings were taken prior to and following the 5-min training session, with rater-ratee combinations counterbalanced. The vignettes were developed to contain previously scaled behavior examples, thus enabling the calculation of "true" criterion scores for each dimension. Comparisons between these "true" criterion and the performance ratings revealed that the training session significantly reduced halo, while leaving validity of the ratings generally unaffected. Performance ratings completed after training possessed lower reliability, although raters provided somewhat more accurate performance profiles.—*Journal abstract.*

1654. Botez, C.; Mamali, Maria & Florea, I. (Academiei de Științe, Sociale și Politice, Inst de psihologie, Bucharest, Romania) [Evaluating criteria for technical occupational proficiency of administrative personnel.] (Romn) *Revista de Psihologie*, 1973, Vol 19(1), 83-93.—Examines various methods of evaluating personnel competence, using personal observations, published literature, and previous research on this topic. An evaluation sheet, experimentally applied in 11 organizations, is presented. It includes 9 variables, which establish an overall evaluation. (French summary)—C. Făcăoaru.

1655. Feild, Hubert S. & Holley, William H. (Auburn U) **Performance appraisal: An analysis of state-wide practices.** *Public Personnel Management*,

1975(May-Jun), Vol 4(3), 145-150.—Reports on a survey of state personnel directors with state-wide performance appraisal systems. The purpose of the survey was to determine the design and implementation of such systems. All available information on each system was requested by letter to state personnel directors. Information from 39 states was content analyzed in 4 major areas: (a) purpose of appraisal information, (b) administration of appraisal program, (c) use of appraisal techniques, and (d) performance rating techniques. Problem areas are identified and it is recommended that by avoiding these problems a reliable and valid performance appraisal system can be developed and set up.—S. Bowser.

1656. Greller, Martin M. (New York U. School of Business Administration) **Subordinate participation and reactions to the appraisal interview.** *Journal of Applied Psychology*, 1975(Oct), Vol 60(5), 544-549.—Conducted 2 studies which examined relationships of subordinate participation in an appraisal interview to reactions to the appraisal and subordinate satisfaction. In Study 1, 25 managers rated their last appraisal on (a) helpfulness and (b) the Wexley et al measure of psychological participation, and then rated their overall satisfaction with supervision. The lack of significant intercorrelations among the psychological participation items indicated that different concepts of participation were represented. Items representing participation in interaction correlated significantly with appraisal helpfulness and satisfaction, while control of goal setting did not correlate significantly. In a 2nd field study, 56 hourly employees and 1st-level managers in a bank rated (a) their appraisal on certain characteristics, (b) their satisfaction with the appraisal, and (c) their job satisfaction. The invitation to participate was most predictive of appraisal satisfaction. The occurrence of goal setting correlated significantly with both appraisal and job satisfaction.—*Journal abstract*.

1657. Hinton, Bernard L. & Barrow, Jeffrey C. (Indiana U) **The superior's reinforcing behavior as a function of reinforcements received.** *Organizational Behavior & Human Performance*, 1975(Aug), Vol 14(1), 123-143.—Investigated the relationship between a superior's own reinforcements and the subsequent reinforcements administered to a subordinate. Utilizing a simulated production cost decision task and a symmetrical nonsaddle point decisional matrix design, data were collected on the economic and evaluative reinforcing behaviors of 126 male undergraduates for 50 trials/S. 2 experimental conditions were evaluated differing only in the reinforcement power of the superior. Findings suggest a significant differential use of positive and negative reinforcements and of economic and evaluative reinforcements. A superior's reinforcing behavior was significantly affected by conditions in which he must share reinforcement power with another superior. Reciprocity considerations were also tested and are questioned as to their applicability in the negative range of outcomes. Implications for administrative practice and research are discussed. (18 ref)—*Journal abstract*.

1658. Mayo, Clyde C.; Nance, Dan M. & Shigekawa, Lynn. (Lifson, Wilson, Ferguson & Winick, Inc, Houston, TX) **Evaluation of the job inventory approach in**

analyzing USAF officer utilization fields. *US AFHRL Technical Report*, 1975(Jun), No 75-22, 84 p.—Conducted a study to evaluate and improve the job inventory method of job analysis as applied to officer positions. 7 utilization fields were analyzed, and inventories were constructed for another 3 fields. The basic finding was that the inventory method can be used operationally in the analysis of officer jobs if job analysis use specific approaches to task statement construction and if more front-end research than is usually needed for airman job inventories is performed prior to the finalization of a job inventory. No magic formulae for the construction of task statements exist; however, after heavy front-end work, the job analyst will obtain enough information to enable him to resolve the issues of task specificity and breadth of coverage for each utilization field on an individual basis. (18 ref)—*Journal abstract*.

1659. Nagasawa, Yuko et al. (Aeromedical Lab, JASDF, Tokyo, Japan) **A study on behavioral analysis of pilot during aircraft controlling: IV. Display of behavioral analysis table and flow chart.** *Reports of Aeromedical Laboratory*, 1975(Mar), Vol 15(4), 196-208.—Developed a method which considers a pilot's behavior during flight as a series of information processing activities, involving perception, decision making, and action. 5 basic patterns of behavior sequences are described: serial, simultaneous, parallel, repetitive, and continuous. A flow diagram depicting these behavioral sequences can be used in the evaluation of work load, the analysis of complex operations, and the investigation of human errors involved in accidents. (20 ref)—S. Nakajima.

1660. Obermayer, Richard W. & Vreuls, Donald. (Manned Systems Sciences, Inc, Northridge, CA) **Combat-ready crew performance measurement system: Phase I measurement requirements.** *US AFHRL Technical Report*, 1974(Dec), No 74-108(II), 57 p.—Notes that research for the improvement of US Air Force combat-crew training, and the efficient execution of current training programs, are heavily dependent upon good sources of information about trainee performance during and at the end of training. To improve training performance information, the present study was directed to systematic definition of performance, development of methods for measurement, and provision of usable measurement tools for attacking problems related to combat-crew training. The current report (1 of 7 which summarize the project) details data on academic, simulator, and flying training gathered from 6 combat-crew training sites. Information was collected with respect to (a) the training sequence, (b) points where measurement exists, (c) measurement possibilities, (d) feasibility of research measurement, and (e) specific new-measurement development. Appendixes include discussion of, and prototype measurements for, 12 flying maneuvers.—B. McLean.

1661. Obermayer, Richard W. & Vreuls, Donald. (Manned Systems Sciences, Inc, Northridge, CA) **Combat-ready crew performance measurement system: Phase II measurement system requirements.** *US AFHRL Technical Report*, 1974(Dec), No 74-108(III), 23 p.—Notes that research for the improvement of US Air Force combat-crew training, and the sufficient execution

of current training programs are heavily dependent upon good sources of information about trainee performance during and at the end of training. To improve training performance information the present study was directed to systematic definition of performance and development of methods for measurement. The current report (1 of 7) which summarizes the project deals with the requirement for a measurement system to process the measurement which has been dictated by the previous reports. The topics discussed are (a) research procedures to indicate the operation in which a measurement system is to serve as a tool in achieving research goals, (b) measurement processing to investigate the nature of data processing associated with training research measurement, (c) system criteria to guide design tradeoffs, and (d) preliminary system analyses to establish measurement system requirements which follow rather directly from system criteria.—*Journal abstract.*

1662. Obermayer, Richard W.; Vreuls, Donald; Muckler, Frederick A. & Conway, Ernest J. (Manned Systems Sciences, Inc., Northridge, CA) **Combat-ready crew performance measurement system: Final report.** *US AFHRL Technical Report*, 1974(Dec), No 74-108(1), 64 p. Summarizes a project directed to (a) systematic definition of performance measures appropriate to US Air Force combat training needs and (b) definition of a cost effective measurement system usable in combat-crew training environments to acquire and process needed training information. System criteria were based on an analysis of combat-crew training research procedures studied during data collection visits to 9 Air Force training sites. A common framework of maneuvers was consolidated from the requirements of 6 types of aircraft and formalized into measurement requirements. Measurement parameters and specifications were produced for hard- and software implications, and an analysis of communications measurement was made from an examination of crew interactions. The resulting performance measurement system contains data acquisition, data processing, personnel, and facilities subsystems. 6 interim reports detail related technical information.—*B. McLean.*

1663. Obermayer, Richard W.; Vreuls, Donald; Muckler, Frederick A. & Conway, Ernest J. (Manned Systems Sciences, Inc., Northridge, CA) **Combat-ready crew performance measurement system: Phase IIID specifications and implementation plan.** *US AFHRL Technical Report*, 1974(Dec), No 74-108(VII), 90 p.—Presents the 7th report on specifications and the implementation plan for a crew performance measurement system. Topics discussed include data acquisition, data processing, personnel, and facilities. An appendix presents example equipment of the types included in the specification.

1664. Smith, Roger C. (FAA Civil Aeromedical Inst., Aviation Psychology Lab, Oklahoma City, OK) **A realistic view of the people in air traffic control.** *FAA Office of Aviation Medicine Report*, 1974(Dec), No 74-12, 6 p.—Results of studies of the personality characteristics, aptitudes, interests, job motivation, and job attitudes of air traffic controllers are summarized and applied to managerial approaches.—*W. E. Collins.*

1665. Vineberg, Robert. **A study of the retention of skills and knowledge acquired in basic training.** *HamRRO Technical Report*, 1975(Jan), No 75-10, 12 p.

As part of the US Army's emphasis on performance based instruction in basic combat training (BCI), a study was performed to measure retention of basic training skills. 200 soldiers were administered 13 subtests of the Comprehensive Performance Test (CPT) on 7 subject areas (e.g., First Aid, Drill, and Ceremonies) after finishing BCI and 6 wks later during advanced individual training. Scores from baseline and retention testing are presented, separately and in combination. Findings indicate that the probability of the average soldier passing a CPT subtest at the end of basic training was .81, of passing during retention testing 6 wks later, .70, and of passing both at the end of basic training and during retention testing was .55. Depending on the measure of retention used, there was an average decrease of approximately 18 or 26% in performance on the CPT when it was readministered 6 wks after the end of BCI. For individual subtests of the CPT, the average decrement in performance ranged between 5 and 44%.—*Journal abstract.*

Management & Management Training

1666. Birkenstock, John; Kurtz, Ronald & Phillips, Steven. **Career executive assignments: Report on a California innovation.** *Public Personnel Management*, 1975(May-Jun), Vol 4(3), 151-155.—In 1963 California started a program to meet the state's need for top level civil service administrators. The "Career Executive Assignments System" deals with positions which constitute about half of 1% of the state's civil service work force. The program has remained free of partisan political manipulation and has met the state's needs effectively.—*S. Bowser.*

1667. Calhoun, Richard P. & Jerdee, Thomas H. (University of North Carolina, Graduate School of Business Administration, Chapel Hill) **First-level supervisory training needs and organizational development.** *Public Personnel Management*, 1975(May-Jun), Vol 4(3), 196-200.—Attempted to find the major training needs of 1st-level supervisors. 1,521 1st- and 2nd-level supervisors were surveyed as to their perception of training needs of 1st-level supervisors. Results indicate a need to approach training by examining and fostering supervisory skills at all levels of management.—*S. Bowser.*

1668. Cascio, Wayne F. (Florida International U., Miami) **Functional specialization, culture, and preference for participative management.** *Personnel Psychology*, 1974(Win), Vol 27(4), 593-603.—Examined preferences for participative management practices as a function of culture and functional specialization. Exercise-Supervise (ES), a training exercise concerned with supervisory style, provided the basic data. ES protocols for 592 managers from 6 cultures were selected for study. As part of ES, managers role played either a subordinate or a supervisor in situations differing in degree of participative decision making. When role playing subordinates, Dutch-Flemish managers were most satisfied and Indian managers least satisfied with a participative supervisor. When role playing supervisors, Japanese managers were least satisfied and Indian managers most

satisfied with an uninvolved subordinate. Little support was found for differences in preferences for participative management as a function of management specialty, finance, sales, or personnel. Implications of results for export of American participatory management practices are discussed. (21 ref)—*J. McKillip.*

1669. Chapman, J. Brad & Luthans, Fred. (U Nebraska, Omaha) **The female leadership dilemma.** *Public Personnel Management*, 1975(May-Jun), Vol 4(3), 173-179.—Presents a comprehensive analysis of current fact and opinion about female leadership, with primary attention to research. It is concluded that there is probably no significant difference between male and female leadership styles but that there is a difference in leadership behaviors. By viewing leadership as an influence system consisting of the leader, the group, and the situation, the problem of looking only at individual leadership differences attributable to sex can be avoided. (19 ref)—*S. Bowser.*

1670. Durand, Douglas E. (U Missouri, St Louis) **Effects of achievement motivation and skill training on the entrepreneurial behavior of Black businessmen.** *Organizational Behavior & Human Performance*, 1975(Aug), Vol 14(1), 76-90.—Conducted an 18-mo study of a training program designed to increase entrepreneurial activities among Blacks. Ss were 35 Black metropolitan area owners or operators of businesses or trainees. The program consisted of 2 parts: achievement motivation and management development training. Posttraining measures indicated that motivation trained participants increased their TAT achievement motivation scores and became less external on Rotter's Internal-External Control Scale. Subsequently, a group which received both achievement motivation training and management development training became significantly more active than a group receiving only management development training or control group. Finally, Ss with an internal perception of reinforcement control were significantly more active than externals. The data suggest that an internal perception might be a prior condition to increased business activity. (28 ref)—*Journal abstract.*

1671. Hammer, Tove H. & Dachler, H. Peter. (Cornell U, New York State School of Industrial & Labor Relations) **A test of some assumptions underlying the path goal model of supervision: Some suggested conceptual modifications.** *Organizational Behavior & Human Performance*, 1975(Aug), Vol 14(1), 60-75.—Attempted to further delineate the psychological meaning of the leadership dimensions of Consideration and schedule within a path-goal approach to employee motivation. The relationship between these 2 leadership dimensions and supervisor-subordinate, as well as intragroup, agreement on subordinate path-goal perceptions was studied in 483 non-supervisory employees and their 31 supervisors. Contrary to the hypothesis advanced by M. G. Evans (1970) and R. J. House (1971) that leader structure has an effect on employee path-goal perceptions, agreement on path-goal perceptions between supervisor and subordinates, as well as among subordinates, was positively related to Consideration and negatively related to Structure. Although some post hoc explanations of these data are advanced, it is concluded

that the usefulness of trying to integrate Consideration and Structure with the vaguely defined concepts of path stimuli goal may be limited. A modified conceptual approach is suggested. (30 ref)—*Journal abstract.*

1672. Holt, K. (U Trondheim, Norway) **Work frustration in engineering departments.** *R & D Management*, 1974(Oct), Vol 5(1), 17-21.—Notes that a large number of engineers work in organizations with specialized jobs of a routine nature, in many ways comparable to workers on a production line. Previous empirical studies demonstrate that this leads to frustration. Although there is no standard solution available, a number of approaches are suggested in the present article that can lead to greater satisfaction if one is willing to experiment with them. A more organic, less structured management system and more use of problem oriented project groups may bring benefits. Job enrichment, where engineers are given more responsibility by transfer of tasks previously done by managers and seniors, and special training, where engineers are given an opportunity to systematically develop their capabilities, should be considered. Organizational development must be mentioned where an external change agent together with the people involved develops a solution aiming at the satisfaction of the needs of both the individual and the organization. Finally, flexible working hours have an indirect effect on the job situation by allowing for a richer life off the job. (24 ref)—*Journal abstract.*

1673. Kerr, Steven & Schriesheim, Chester. (Ohio State U, Coll of Administrative Science) **Consideration, initiating structure, and organizational criteria: An update of Korman's 1966 review.** *Personnel Psychology*, 1974(Win), Vol 27(4), 555-568.—Reviewed research on leader behavior dimensions published since A. K. Korman's 1966 review (see PA, Vol 41:5147) to determine to what extent his criticisms had been met. Researchers have (a) recognized the influence of situational moderating variables; (b) begun to uncover significant relationships between leader behaviors and subordinate morale and satisfaction; (c) are likely to use separate sources for obtaining information on independent and dependent variables; (d) have been unable to establish the direction of causal relationship between leader behavior and subordinate outcomes; and (e) have not established the range of leader behaviors which are related to subordinate outcomes. (43 ref)—*Journal summary.*

1674. Latham, Gary P.; Wexley, Kenneth N. & Pursell, Elliot D. (Weyerhaeuser Co, Human Resources Research, Tacoma, WA) **Training managers to minimize rating errors in the observation of behavior.** *Journal of Applied Psychology*, 1975(Oct), Vol 60(5), 550-555.—Assigned 60 managers in a large corporation to a workshop, a group discussion, or a control group. The workshop and group discussion involved training directed toward the elimination of rating errors that occur in performance appraisal and selection interviews (i.e., contrast effects, halo effect, similarity, and first impressions.) 6 mo after the training. Ss rated hypothetical candidates who were observed on videotape. Results show that (a) trainees in the control group committed similarity, contrast, and halo errors; (b) trainees in the group discussion committed impression errors; and (c) trainees

in the workshop committed none of the errors. The importance of observer training for minimizing the "criterion problem" in industrial psychology is discussed (19 ref). *Journal abstract*

1675. Marsh, John J. (U New Mexico, Northern Branch) **Operations analysis and employee-management relations.** *Public Personnel Management*, 1975(May-Jun), Vol 4(3), 160-164. Notes that operations analysis has seldom been used for personnel problems, especially public personnel. The concept is discussed and a mathematical model in the context of an employee-management relation problem is presented. It is concluded that this is an excellent technique that should be used for public personnel management problems.—S. Bowser.

1676. Meyer, Herbert H. (U South Florida) **The pay-for-performance dilemma.** *Organizational Dynamics*, 1975(Win), Vol 3(3), 39-50. Criticizes merit pay systems as demotivating rather than motivating employees, because most people exaggerate their performance and feel cheated whenever they get a raise. Managers are inclined to make relatively small discriminations in salary treatment between individuals in the same job, regardless of perceived differences in performance. Interest in the task itself decreases to the extent that pay is attached directly to the performance of the task. A revised pay system is suggested based on an individual's salary range within a job, increasing at a fairly predictable rate as long as performance meets previously negotiated criteria.—R. Tomasko.

1677. Miner, John B. (Georgia State U) **Student attitudes toward bureaucratic role prescriptions and prospects for managerial talent shortages.** *Personnel Psychology*, 1974(Win), Vol 27(4), 605-613.—Surveyed changing attitudes of management students toward bureaucratic role prescriptions by comparing responses on the Miner Sentence Completion Scale by 287 students from 1 university in 1960-1967, by 368 students from 3 universities in 1966-1969, and by 553 students from 4 universities in 1970-1972. Over the 3 time periods a general decline appears in favorable attitudes toward overall managerial role, toward authority, and toward assuming the masculine role. A lesser decrease was found for attitudes toward assuming administrative responsibility. A decrease from the 1st to the 2nd period was reported for competitive motivation, but not for the 2nd to 3rd period. No change was found for attitude toward assuming a differentiated role and for power motivation. Implications are discussed for the future staffing of managerial positions; the fear is expressed that a major shortage of managerial talent lies ahead.—J. McKillip.

1678. Mitchel, James O. (Life Insurance Marketing & Research Assn, Hartford, CT) **Assessment center validity: A longitudinal study.** *Journal of Applied Psychology*, 1975(Oct), Vol 60(5), 573-579.—Data on 254 managers attending an assessment center were examined for changes in validities over time. 24 predictors were correlated with a criterion of salary growth measured 1, 3, and 5 yrs after Ss were assessed. Before conducting the analyses, Ss were grouped into 3 generations based on the year they were assessed. Peer and assessor ratings, along with linear combinations, were significantly correlated with the criterion. The multiple correlations

generalized well across time and generations. A general increasing trend in the validity coefficients was noted over time. Comparison of overall assessor rating with multiple correlation did not indicate any marked superiority for actuarial prediction. (21 ref)—*Journal abstract*

1679. Newby, John H. (Catholic U of America) **An assessment of the relationship between racial perceptions and patterns of leadership behavior among Black and White Army company commanders.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1366-1367.

1680. Otto, Mary L. & Smith, David G. (Oakland U) **Consultation: A new strategy for CETA.** *Journal of Employment Counseling*, 1975(Sep), Vol 12(3), 112-119.—Program changes inherent in the Comprehensive Education and Training Act (CETA) concept have markedly decreased the effectiveness of previous program management and liaison strategies. Some reasons for this decrease and a new set of skills for working at the interface between prime sponsors and subcontractors and/or the regional offices are presented. These skills, formulated within a consultation model and based on solid behavioral strategies, are one way to increase CETA program effectiveness. They involve training in communication procedures, problem diagnosis, problem-solving strategies, decision-making skills, and planning techniques.—*Journal abstract*.

1681. Pendse, Shripad G. (Stanford U) **A study of attitude change during management education.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1360-1361.

1682. Sokolove, Phillip G. (U Maryland, Baltimore County) **Localization of the cockroach optic lobe circadian pacemaker with microlesions.** *Brain Research*, 1975, Vol 87(1), 13-21.—Electrolytic microlesions were made at various sites in optic lobes of cockroaches (*Leucophaea maderae*) and Ss were assayed for circadian locomotor rhythms. Results suggest that the cell bodies and not the neuropile areas of the lobe are the crucial elements of the clock driving the cockroach's circadian activity rhythm.

Organizational Behavior & Job Satisfaction

Human Factors Engineering

1683. Allen, T. J. & Fustfeld, A. R. (Massachusetts Inst of Technology) **Research laboratory architecture and the structuring of communications.** *R & D Management*, 1975(Feb), Vol 5(2), 153-164.—Review of the literature indicates the way in which communication in research and development organizations is influenced by the physical, architectural arrangement of the laboratory. Communication between individuals is very sensitive to both the horizontal and vertical distances separating them. A partially successful experiment is reported in which an attempt was made to improve communication in an organization through architectural change. (21 ref)

1684. Currie, Larry. (City of London Polytechnic, England) **Habit as the source of an inappropriate response.** *Ergonomics*, 1975, Jul, 435-442.—Notes that, in the driving situation, the experienced driver develops habitual responses which serve him well most of the time.

However, in some emergency situations, a limited repertoire of habitual responses, such as braking or swerving, may be inadequate to cope with a situation which is incongruous with the driver's stimulus-response contiguity pattern of avoidance behavior: a situation where a diametrically opposed response is required to avert disaster. When a driver is called upon to accelerate, rather than brake suddenly, his habitual, almost reflexive, response to the emergency situation may aggravate the danger in the situation and possibly culminate in a crash. Results of a study with 19 pairs of male drivers matched for age, occupation, driving experience, and exposure to risk are used to describe such a perverse situation. Important inferences for safety training, with particular reference to the perceptual style of the individual, are discussed. (French & German summaries) —*Journal abstract.*

1685. **Fhanér, Gunilla & Hane, Monica.** (U Göteborg, Sweden) **Seat belts: Changing usage by changing beliefs.** *Journal of Applied Psychology*, 1975(Oct), Vol 60(5), 589-598.—Tested a model to predict seat belt use, based on a linear combination of (a) beliefs about discomfort when wearing a seat belt and (b) beliefs about injury reducing effects of seat belts. 154 employees of a large steel company, nonusers of seat belts, were randomly assigned to 1 of 6 groups receiving one or a combination of the following treatments: (a) verbal information stressing the role of seat belts in reducing injury, (b) nonverbal practice in seat belt use, (c) verbal information irrelevant to seat belt use, or (d) no treatment. Groups receiving seat belt information had the most favorable posttest beliefs and displayed the greatest increase in seat belt usage, although the effects generally decreased over time. The Discomfort (D) factor and the model ($D \times E$) were equally predictive, while the Effect (E) factor was predictive only at low values. A multiplicative model is discussed.—*Journal abstract.*

1686. **McRuer, Duane T. et al.** (Systems Technology, Inc, Hawthorne, CA) **Measurement of driver: Vehicle multiloop response properties with a single disturbance input.** *IEEE Transactions on Systems, Man, & Cybernetics*, 1975(Sep), Vol 5(5), 490-497.—Notes that multiloop response properties of controllers are very difficult to obtain because an independent forcing function is needed for each describing function to be measured, and interpolation procedures may be required to obtain intermediate describing functions at common frequencies. It is argued that, when the loops that are closed and the nature of the describing function forms adopted in each loop are known or hypothesized, matters can be made much simpler. Then, the quantitative values of the individual describing functions can be readily identified using appropriate closed-loop describing function measures and decomposition procedures. 2 examples are provided for the measurement of driver-vehicle multiloop response properties using a single disturbance input. The validity of the procedure is based on current multiloop operator adjustment rules and is made plausible by comparison with experimental data. (17 ref) —*Journal abstract.*

1687. **Potter, Norman R.; Korkan, Kenneth D. & Dieterly, Duncan L.** A procedure for quantification of

technological changes on human resources. *US AFHRL Technical Report*, 1975(Jun), No 75-33, 79 p. —Attempted to locate and apply an existing method or to develop a new procedure for quantifying the effects of incoming technology. A 5-step approach was taken which included a search and critical analysis of the recent literature on the status of forecasting and assessing technology and techniques for predicting the impact of technology on human resources; development of Design Option Design Trees (DODT) describing 2 Air Force systems; synthesis of existing techniques to develop a procedure for measuring the effects of technology on human resources; application of the procedure; and evaluation of the feasibility of the evolved procedure. A procedure integrating the DODT with a modification of the method of summated ratings was developed to permit quantification of specific human resource components at each of the design options represented in the DODT. Based on judgmental data collected from an Air Force operational unit, it is concluded that quantifying human resource components associated with hardware design options by means of a technique incorporating a DODT and a modification of the method of summated ratings is a feasible approach and can provide a methodological procedure for measuring the effects of advances in technology on human resources.—*Journal abstract.*

1688. **Potter, Norman R.; Korkan, Kenneth D. & Dieterly, Duncan L.** Development, application, and evaluation of a procedure for quantification of technological change impact on human resources. *US AFHRL Technical Report*, 1975(Jun), No 75-29(1), 39 p. —Describes a multi-phase study to develop methods for determining the components and measuring the effects of advances in technology on human resources in Air Force weapon systems. A 1st phase of the effort involved an analysis of the literature to review the status of forecasting and assessing technology and of techniques for predicting the impact of technology on human resource parameters. The 2nd phase involved the development of Design Option Decision Trees (DODT) for 2 areas of Air Force systems technology: Digital Avionics Information System (DAIS) and Remotely Piloted Vehicle Systems (RPV). The 3rd phase called for the development of unique methods or synthesis of existing techniques to result in a new method for measuring the effects of technology on Air Force human resources. The 4th phase involved application of the method developed under Phase 3. The 5th phase entailed making an evaluation of the usefulness of the method to system designers and planners. A method integrating the DODT with a modification of the method of summated ratings was developed to arrive at a quantification of human resource effects of technological innovations. (27 ref)—*Journal abstract.*

1689. **Wyon, D. P.; Fanger, P. O.; Olesen, B. W. & Pedersen, C. J.** (National Swedish Inst for Building Research, Environmental Lab, Lund) **The mental performance of subjects clothed for comfort at two different air temperatures.** *Ergonomics*, 1975(Jul), Vol 18(4), 359-374.—16 male and 16 female 18-25 yr old students performed sedentary work in a climate chamber under conditions of light and of heavy clothing. During

the exposures the air temperature was continuously adjusted up or down at the S's request, as indicated on a dial voting apparatus, so that he remained in thermal comfort. Skin temperatures were measured throughout. Performance measures were obtained on a numerical addition task, a recognition memory task, and a test of cue-utilization. Ss rated their effort, arousal and fatigue, and the freshness of the air on semantic differential scales. No significant differences in performance could be shown between the 2 conditions. Subjective effort, arousal, and fatigue did not differ, but Ss considered that the air was fresher in the cool air/heavy clothing condition. Male Ss maintained a significantly higher mean skin temperature and a significantly higher evaporative weight loss under both clothing conditions than did female Ss. However, there were no significant differences between the air temperatures preferred by male and female Ss. The average preferred air temperature was 23.2° and 18.7°C for light and heavy clothing conditions, respectively. (French & German summaries) (17 ref)—*Journal abstract*.

1690. Ziperman, H. Haskell & Smith, George R. (Southwest Research Inst, San Antonio, TX) **Startle reaction to air-bag restraints.** *JAMA: Journal of the American Medical Association*, 1975(Aug), Vol 233(5), 436-440.—Notes that air bags in vehicles constitute a form of passive restraint for individuals involved in auto accidents. There is fear, however, that the inadvertent nonaccident-connected deployment of one of these air bags might substantially interfere with the handling of a vehicle in which such deployment occurred. Results of an experiment with 51 19-74 yr old drivers show, however, that while physiologic and physical evidence of startle accompanies such unexpected deployment, good control of the vehicle continued to be exercised by S under the conditions of experiment protocol.—*Journal abstract*.

Environmental Psychology & Environmental Issues

1691. Baum, Andrew; Harpin, R. Edward & Valins, Stuart. (Trinity Coll, Hartford, CT) **The role of group phenomena in the experience of crowding.** *Environment & Behavior*, 1975(Jun), Vol 7(2), 185-198.—Discusses the mediation of the crowding experience in different residential environments in terms of the formation and functioning of residential groups. It was hypothesized that membership in groups in crowded settings would reduce the likelihood that residents would feel crowded because of increased regulation and control of social interactions between residents. Data indicate that residential groups were less likely to form in crowded environments, but that when they did form, experienced crowding and stress were reduced. The implications of these findings, with regard to design intervention in high density settings, are discussed.—*Journal abstract*.

1692. Blake, Brian F.; Weigl, Karl & Perloff, Robert. (Purdue U) **Perceptions of the ideal community.** *Journal of Applied Psychology*, 1975(Oct), Vol 60(5), 612-615.—A stratified random sample of 4,619 adults living in 3 different-sized communities in Indiana responded to a mail survey assessing their orientations to the ideal residential community. Ratings of the importance of 11 attributes of a community were factor analyzed, yielding

3 dimensions: (a) Maintenance, (b) Personal Relations, and (c) Recreation.

1693. Collins, Belinda L. (National Bureau of Standards Inst for Applied Technology Washington DC) **Windows and people: A literature survey. Psychological reaction to environments with and without windows.** *NBS Building Science Series*, 1975(Jun), No 70, 88 p.

An evaluation of people's response to a variety of windowless situations reveals that although the attitudes toward a windowless space are often somewhat unfavorable, the most adverse reaction occurs in a small, restricted, and essentially static environment. This suggests that one function performed by a window is the addition of a dynamic, active quality to an interior environment. Another essential function of a window is the provision of a view of the external world. Although almost any view is acceptable, there is some evidence that views with a high information content are preferable. In addition, windows admit illumination which furnishes a dynamic, changing character to a room. The functions of windows, however, extend beyond view and illumination to an enhancement of the basic character of a room, such that the mere presence of a window may cause a room to appear more spacious. The optimum sizes and shapes of a window for fulfilling these various functions are discussed. (35 ref)—*Journal abstract*.

1694. Dean, Larry M.; Pugh, William M. & Gunderson, E. K. (US Naval Health Research Ctr, Fleet Problems Branch, San Diego, CA) **Spatial and perceptual components of crowding: Effects on health and satisfaction.** *Environment & Behavior*, 1975(Jun), Vol 7(2), 225-236.—Conducted a questionnaire study of US Navy crews which examined the relationship of 3 components of 2 measures of crowding to 6 behavioral and attitudinal criteria.

1695. Goldsmith, Francis J. & Hochbaum, Godfrey M. (Public Health Service, Health Services Administration, Rockville, MD) **Changing people's behavior toward the environment.** *Public Health Reports*, 1975(May-Jun), Vol 90(3), 231-234.—Argues that behavioral techniques should be developed to induce individuals to improve the environment.

1696. Kahoe, Richard D. (Georgetown Coll) **Motivations for urban-rural migration.** *Journal of Social Psychology*, 1975(Aug), Vol 96(2), 303-304.—Administered a lifestyle preference survey to 180 undergraduates to investigate psychological factors in the preference for living in rural vs metropolitan areas. 3 relatively independent replicated factors derived from these Ss' scores (naturalism vs technology), avoidance of metropolitan problems, and social intimacy of responses small town vs culture of city) were converted into scales and administered to 216 Ss who had indicated ultimate residence plans. Avoidance was found to be the most general motivation scale and social intimacy vs culture the least general.

1697. Mackintosh, Elizabeth; West, Sheree & Saegert, Susan. (Graduate School & University Ctr, City U New York) **Two studies of crowding in urban public spaces.** *Environment & Behavior*, 1975(Jun), Vol 7(2), 159-184.—Conducted 2 studies in densely populated public urban places to (a) determine whether information overload occurs as a result of large numbers of people in

close proximity (high density) and (b) measure the performance and emotional consequences of high density settings. Study 1, which investigated cognitive clarity, compared descriptions from 28 female students who were exposed individually for 30 min to either crowded or uncrowded conditions in a shoe section of a department store. Crowding affected incidental recall (accuracy of maps drawn after the exposure) but not focal recall (descriptions of shoes and people made during the exposure). Study 2, which examined affective responses to overload, compared reactions of 20 male and 20 female New York City adults; Ss were exposed for 30 min to either crowded or uncrowded conditions at a railroad terminal. Half of the Ss received an orientation to the terminal (tour and map). Neither density nor orientation affected performance on simple, inconspicuous tasks typically found in the setting (performed during exposure). Density, however, affected emotional reactions (measured after exposure). Sex \times Density interactions for emotional reactions are examined. (39 ref)—S. T. Margulis.

1698. Morris, Earl W. & Winter, Mary. (Iowa State U, Coll of Home Economics) **A theory of family housing adjustment.** *Journal of Marriage & the Family*, 1975(Feb), Vol 37(1), 79-88.—Presents a conceptual and theoretical framework for the study of the housing adjustment behavior of families. Families are viewed as evaluating their housing in terms of cultural and family norms. When their housing does not meet the norms, it tends to give rise to dissatisfaction, producing a propensity to reduce the normative deficit. Residential mobility, residential adaptation, and family adaptation are the modes of adjustment used to reduce such deficits and are undertaken when the constraints on the behavior can be overcome. (71 ref)—*Journal abstract*.

1699. Tainsh, M. A. & Winzar, G. H. (Admiralty Research Lab, Applied Psychology Unit, Teddington, England) **The influence of travelling on decision-making.** *Ergonomics*, 1975(Jul), Vol 18(4), 427-434.—Used the results from 2 experiments, with a total of 88 paid students, to construct an instrument sensitive to detecting changes in an individual's intellectual capacity following the environmental stimulation of a 100-mile journey. Exp I showed that such an instrument could be devised by using the Ss' scores after 20 min on the Watson-Glaser Critical Thinking Test. These scores were lower if the Ss completed the bus journey before doing the test. Exp II showed how much the scores were lowered at times subsequent to leaving the bus. It was observed that the number of questions answered correctly showed a significant decrement approximately 11 min after disembarkation, whereas 10-15 min later it was the number of questions attempted which showed a significant decrement. (French & German summaries)—*Journal abstract*.

Marketing & Advertising

1700. Armstrong, Gary M.; Kendall, C. L. & Russ, Frederick A. (U North Carolina) **Applications of consumer information processing research to public policy issues.** *Communication Research*, 1975(Jul), Vol 2(3), 232-245.—Conducted 2 studies involving consumer information processing (CIP) research designed to

provide information for policy makers. Study 1 investigated the measurement of deception in advertising using 108 members of church and Parent Teacher Association groups. Study 2 used 204 university students (Exp I) and the 108 original Ss (Exp II) to investigate consumer perceptions of packaged goods warranties. Results of both studies indicate that CIP research can provide potentially helpful information for policy makers. CIP researchers are encouraged to assume both a forecasting and a persuasive communications role. (29 ref)—R. Tomasko.

1701. Bettman, James R.; Capon, Noel & Lutz, Richard J. (U California, Los Angeles) **Information processing in attitude formation and change.** *Communication Research*, 1975(Jul), Vol 2(3), 267-278.—Conducted 3 studies using information integration methodology to examine processing rules combining components of M. Fishbein's (1967) attitude model. Results of Study 1, using 77 Ss, indicate the Fishbein model rating task yielded a high degree of homogeneity of response across Ss. Study 2 used 72 psychology undergraduates to examine the model's summation assumptions, and Study 3 investigated adding and averaging with 167 undergraduates. Findings illustrate the usefulness of information integration methodology in investigating attitude formation and change.—R. Tomasko.

1702. W. Calder, Bobby J., Robertson, Thomas S. & Rossiter, John R. (Northwestern U) **Children's consumer information processing.** *Communication Research*, 1975(Jul), Vol 2(3), 307-316.—Discusses theoretical considerations in the approximate modeling of children's consumer information processing. Ways such models differ from adult models are noted. The concept of mediational representation is discussed, and strengths and weaknesses of the Piagetian approach as applied to consumer research are considered. The concept of an information processing sequence is extended to children in several areas: attention, representation, comprehension and acceptance, and information retrieval and behavior. (32 ref)—R. Tomasko.

1703. Cimbalo, Richard S. & Mousaw, Patricia M. (Rosary Hill Coll) **Crowding and satisfaction in a banking environment, an ethological approach.** *Psychological Reports*, 1975(Aug), Vol 37(1), 201-202.—86 randomly selected customers were observed as they entered a bank. A number of behavioral and situational variables were recorded by E on a portable tape recorder. The only significant predictor of satisfaction was the number of customers in the bank. The more crowded the bank, the less satisfied was the customer. Results are explained in terms of the violation of personal space and/or the S's perception of depersonalized service.—*Journal abstract*.

1704. Lutz, Richard J. (U California, Los Angeles) **First-order and second-order cognitive effects in attitude change.** *Communication Research*, 1975(Jul), Vol 2(3), 289-299.—Examined cognitive and attitudinal effects of a persuasive advertising message on 491 female Ss. Analysis of questionnaire data indicated that 2nd order effects that enhance desired 1st order effects may be essential to a successful persuasive campaign. Messages designed to modify single elements of cognitive structure led to concomitant changes in attitude. A

communication strategy, predicted by the independent variables in combination with gender and the strategy response interaction term ($p < .001$).

1106. Park, C. W. & Smith, Joseph N. (2005). The impact of prior familiarity and cognitive complexity on information processing routes. *Communication Research*, 32(4), 471-491. doi:10.1177/0893126905275999. doi:10.1177/0893126905275999. The use of a quasi-experimental lab in studying differences in a measure of how we interpret social communication may be predictive of a broader use across industries and domains. Not surprisingly, evidence of the social factors that are predictive of choices. The results support the authors' *J* message.

This study outlines existing methods to make informed decisions of communicating stimuli and make inferences about the stimuli that need to estimate the stimuli. A research tool being that serves to experimentally design complex communication, as noted along with the literature in *J*.

BRIEF SUBJECT INDEX

Entries in the Brief Subject Index are derived from a 4,000-term *Thesaurus of Psychological Index Terms*. Only those terms representing subject matter content covered in this monthly issue are listed. A thesaurus term missing from the listing indicates that no material of major relevance to the concept is included in the issue. Records are indexed at the level of specificity contained in each document. Each index entry also refers the reader to more specific concepts related to each term. Thus, a reader interested in articles concerning childhood psychosis may find additional relevant information under "early infantile autism."

- Curriculum [See Also Art Education, Braille Instruction, Business Education, Drug Education, Foreign Language Education, Health Education, Language Arts Education, Mathematics Education, Music Education, Physical Education, Reading Education, Science Education, Sex Education, Spelling, Vocational Education] 1264, 1301, 1329, 1331, 1336, 1349, 1363, 1369, 1383, 1385, 1391, 1398, 1405, 1407, 1457, 1570
- Curriculum Development 1306, 1403, 1438, 1587, 1647
- Cutaneous Sense [See Also Tactile Perception, Vibrotactile Thresholds] 109
- Cybernetics 1612
- Cyclothymic Personality 844
- Cynicism 595
- Czechoslovakia 1131
- Daily Biological Rhythms (Animal) [See Animal Circadian Rhythms]
- Dark Adaptation 127, 134
- Dating (Social) [See Social Dating]
- Daughters 580, 922
- Day Camps (Recreation) [See Summer Camps (Recreation)]
- Day Care (Child) [See Child Day Care]
- Deaf 909, 922, 928, 1528, 1533, 1534, 1580
- Death And Dying 14, 568, 780, 800, 1140, 1141
- Death Attitudes 568, 780, 785, 798, 800, 903, 1140
- Death Penalty [See Capital Punishment]
- Death Rate [See Mortality Rate]
- Decarboxylases 419, 423
- Deception [See Also Faking, Malinger-ing] 209, 1633, 1700
- Decision Making [See Also Choice Behavior] 89, 90, 104, 171, 178, 180, 186, 332, 596, 655, 663, 722, 723, 731, 1265, 1310, 1506, 1609, 1619, 1644, 1657, 1699, 1700, 1708, 1708, 1709
- Deductive Reasoning [See Inductive Deductive Reasoning]
- Defecation 282
- Defense Mechanisms [See Also Denial, Fantasy (Defense Mechanism), Identification (Defense Mechanism), Regression (Defense Mechanism)] 903, 959, 969
- Defensiveness 1611
- Deficiency Disorders (Nutritional) [See Nutritional Deficiencies]
- Degrees (Educational) [See Educational Degrees]
- Delayed Reinforcement [See Reinforcement Schedules]

BRIEF SUBJECT INDEX

- Delinquency (Juvenile)** [See Juvenile Delinquency]
Delirium Tremens 1066
Delta Rhythm 306
Delusions 812
Dementia (Presenile) [See Presenile Dementia]
Dementia (Senile) [See Senile Dementia]
Dementia Praecox [See Schizophrenia]
Democratic Party [See Political Parties]
Demographic Characteristics 665, 700, 798, 856, 906, 1108, 1220, 1253, 1284, 1302, 1313, 1391, 1485, 1506, 1567, 1616
Denial 827
Dental Education 1209
Dental Students 1209
Dentistry 1353
Dependency (Drug) [See Drug Dependency]
Dependency (Personality) 554, 571, 575, 819, 1471
Depression (Emotion) [See Also Manic Depression] 831, 840, 841, 844, 855, 866, 945, 947, 990, 991, 994, 1070, 1083, 1086, 1088, 1113, 1224, 1472
Deprivation [See Also Food Deprivation, Sensory Deprivation, Sleep Deprivation, Social Isolation] 289
Depth Perception 119, 121, 125, 132, 237, 621
Desensitization (Systematic) [See Systematic Desensitization Therapy]
Design (Experimental) [See Experimental Design]
Design (Man Machine Systems) [See Man Machine Systems Design]
Desirability (Social) [See Social Desirability]
Desires [See Motivation]
Detection (Signal) [See Signal Detection (Perception)]
Detention (Legal) [See Legal Detention]
Detoxification 1206
Development [See Also Related Terms] 508
Developmental Age Groups [See Adolescents, Adults, Aged, Children, Infants, Middle Aged, Neonates, Preschool Age Children, School Age Children, Young Adults]
Developmental Differences [See Also Age Differences, Sex Linked Developmental Differences] 563
Developmental Psychology [See Gerontology]
Developmental Stages [See Also Embryo, Fetus, Puberty] 946, 1168
Deviant Behavior [See Antisocial Behavior]
Deviations (Sexual) [See Sexual Deviations]
Devices (Experimental) [See Apparatus]
Devices (Safety) [See Safety Devices]
Dexamphetamine [See Dextroamphetamine]
Dexedrine [See Dextroamphetamine]
Dextroamphetamine 412, 430, 439, 451, 463, 471, 1074
Diabetes [See Diabetes Insipidus]
Diabetes Insipidus 365
Diacylmorphine [See Heroin]
Diagnosis [See Also Cardiology, Differential Diagnosis, Electrocardiography, Electroencephalography, Electromyography, Galvanic Skin Response, Medical Diagnosis, Ophthalmologic Examination, Psychodiagnosis] 949, 1112, 1522
Dialect [See Also Nonstandard English] 488, 512
Diastolic Pressure 447, 1180
Diazepam 473, 885
Diencephalon [See Hypothalamus, Thalamus]
Differential Diagnosis 834, 857, 946
Differential Limen [See Thresholds]
Digestive System [See Gastrointestinal System, Intestines, Mouth (Anatomy), Teeth (Anatomy), Tongue]
Digestive System Disorders [See Colitis, Gastrointestinal Ulcers]
Digit Span Testing 1437
Digits (Mathematics) [See Numbers (Numerals)]
Dilantin [See Diphenylhydantoin]
Dilation (Pupil) [See Pupil Dilation]
Diphenhydramine 416
Diphenylhydantoin 1090
Diphenylhydantoin Sodium [See Diphenylhydantoin]
Disadvantaged 736, 1022, 1252, 1256, 1303, 1338, 1426, 1495, 1499, 1516, 1529, 1541, 1566, 1581
Discipline (Child) [See Child Discipline]
Discipline (Classroom) [See Classroom Discipline]
Discovery Teaching Method 1348, 1392
Discrimination (Cognitive) [See Cognitive Discrimination]
Discussion (Group) [See Group Discussion]
Dislike [See Aversion]
Displays [See Also Visual Displays] 4
Disposition [See Personality]
Disruptive Behavior [See Behavior Problems]
Dissociative Patterns [See Amnesia]
Dissonance (Cognitive) [See Cognitive Dissonance]
Distance Discrimination [See Distance Perception]
Distance Perception 138
Distortion (Perceptual) [See Illusions (Perception)]
Distractibility 773, 1539
Distress 517, 1010
Disturbed (Emotionally) [See Emotionally Disturbed]
Diuretics [See Caffeine]
Diurnal Variations [See Human Biological Rhythms]
Divergent Thinking 1300, 1417
Divorced Persons 653
Doctors [See Physicians]
Dogmatism [See Authoritarianism]
Dogs 449, 463
Dolphins 231
Dominance (Animal) [See Animal Dominance]
Dominance Hierarchy 280
Domination [See Authoritarianism]
Donors [See Charitable Behavior]
Dopamine 439, 464, 468, 470
Dormitories 1369, 1510
Down Syndrome 889, 1156
Draftees 1109
Drama 497, 503
Drawing 806, 1540
Dream Analysis 824
Dream Content 425, 824
Dream Interpretation [See Dream Analysis]
Dreaming 425
Drinking (Alcohol) [See Alcohol Drinking Patterns]
Drinking Behavior (Animal) [See Animal Drinking Behavior]
Drive [See Motivation]
Driver Safety [See Highway Safety]
Drivers 410, 1684, 1686, 1690
Driving Behavior 410, 1684, 1686, 1690
Dropouts [See Also School Dropouts] 1565
Drowsiness [See Sleep Onset]
Drug Abuse [See Also Drug Addiction, Heroin Addiction] 695, 700, 703, 864, 865, 885, 1194, 1364
Drug Addiction [See Also Heroin Addiction] 675, 699, 885, 886, 1089, 1196, 1197, 1198, 1203, 1204
Drug Administration Methods 1202
Drug Adverse Reactions 1062, 1066, 1068, 1073, 1081, 1084, 1090
Drug Dependency [See Also Drug Addiction, Heroin Addiction] 438, 441, 461, 877
Drug Dosages 414, 436, 462, 463, 464, 471, 1060, 1069, 1081, 1086, 1092, 1206
Drug Education 701, 1364, 1403
Drug Effects [See Also Drug Addiction, Drug Adverse Reactions, Drug Dependency, Drug Sensitivity, Heroin Addiction, Side Effects (Drug)] 361, 364, 367, 368, 369, 370, 372, 373, 374, 375, 376, 377, 381, 410, 411, 412, 413, 414, 415, 416, 417, 418, 419, 422, 423, 424, 425, 426, 428, 429, 430, 431, 432, 433, 434, 435, 436, 437, 438, 439, 440, 442, 443, 444, 445, 446, 447, 448, 449, 451, 452, 454, 455, 456, 457, 458, 459, 460, 462, 463, 464, 465, 466, 467, 469, 470, 471, 472, 473, 474, 475, 476, 704, 835, 865, 874, 1061, 1063, 1076, 1077, 1092
Drug Laws 703
Drug Potentiation 1062
Drug Rehabilitation 675, 703, 1186, 1193, 1195, 1196, 1197, 1198, 1199, 1200, 1201, 1202, 1203, 1204, 1205, 1206, 1207, 1208, 1221
Drug Sensitivity 364
Drug Synergism 361
Drug Therapy 835, 873, 945, 947, 1060, 1061, 1062, 1063, 1064, 1065, 1066, 1067, 1068, 1069, 1070, 1071, 1072, 1073, 1074, 1075, 1076, 1077, 1078, 1079, 1080, 1082, 1083, 1084, 1085, 1086, 1087, 1088, 1090, 1091, 1092, 1093, 1095
Drug Tolerance 413, 418, 431, 461, 1060
Drug Usage [See Also Drug Abuse, Drug Addiction, Drug Dependency, Glue Sniffing, Heroin Addiction, Marijuana Usage] 421, 460, 692, 694, 696, 698, 700, 706, 801, 1403
Drug Usage Attitudes 698, 700, 702, 705, 1093, 1364
Drug Withdrawal 438
Drug Withdrawal Effects 441, 1078
Drugs [See Also Related Terms] 413, 421, 433, 437, 465, 477, 1079, 1087
Drunkenness [See Alcohol Intoxication]
Ducks 279
Duodenum [See Intestines]
Duration (Response) [See Response Duration]
Duration (Stimulus) [See Stimulus Duration]
Dyads 716, 717, 718, 720, 725, 732, 733, 734

BRIEF SUBJECT INDEX

- Dying [See Death And Dying]
 Dyskinesia 1068, 1116
 Dysmetria [See Ataxia]
 Dyspnea [See Asthma]
 Dysthymia [See Depression (Emotion)]
 Dystonia [See Muscular Disorders]

Experiences (Life) [See Life Experiences]
Experiment Controls 18, 1072
Experiment Volunteers 1076
Experimental Apparatus [See Apparatus]
Experimental Design [See Also Followup Studies, Longitudinal Studies] 18, 24, 25, 35, 227, 238, 265, 477, 810
Experimental Instructions 179, 206, 212, 553, 821
Experimental Laboratories 1683
Experimental Methods 21, 22, 24, 25, 27, 34, 35, 301, 471, 944, 1038
Experimental Replication 681, 1134, 1696
Experimentation [See Also Related Terms] 29, 31, 32, 208, 1212, 1673
Experimenter Bias 37, 1399
Experimenter Expectations 37, 105
Experimenters 512, 707
Exploratory Behavior [See Animal Exploratory Behavior]
Explosive Personality 873
Exposure Time (Stimulus) [See Stimulus Duration]
Expressions (Facial) [See Facial Expressions]
Extended Family 634
Extinction (Learning) 247, 248, 260, 263, 265, 295, 422, 894, 1058
Extracurricular Activities 1244
Extrapyramidal Tracts 426
Extraversion 106, 188, 801, 807
Extrinsic Motivation 210
Eye (Anatomy) [See Lens (Eye), Pupil (Eye), Retina]
Eye Contact 478, 761
Eye Disorders [See Also Myopia, Nystagmus] 930
Eye Examination [See Ophthalmologic Examination]
Eye Movements 23, 93, 119, 192, 311, 350, 425, 1527
Eyelid Conditioning 267, 894
Eysenck Personality Inventory 821

Face (Anatomy) 379, 515, 810
Facial Expressions [See Also Smiles] 573
Facial Features 573

Facilitation (Social) [See Social Facilitation]
Factor Analysis 38, 67, 68, 77, 667, 1582
Factors (Sociocultural) [See Sociocultural Factors]
Faculty [See Educational Personnel]
Fads And Fashions [See Clothing Fashions]
Failure 764
Faking [See Also Malingering] 39, 821
Familiarity 276, 486, 756, 1705
Family Background [See Also Family Socioeconomic Level, Parent Educational Background, Parental Occupation] 294, 634, 1306, 1326
Family Counseling [See Family Therapy]
Family Life [See Family Relations]
Family Members [See Also Adopted Children, Adoptive Parents, Daughters, Fathers, Mothers, Parents, Siblings, Sons, Spouses, Twins, Unwed Mothers, Wives] 653, 1152
Family Physicians 863, 1152, 1224
Family Planning [See Also Birth Control, Oral Contraceptives, Vasectomy] 650, 652, 1137
Family Planning Attitudes 686
Family Relations [See Also Child Discipline, Childrearing Practices, Father Child Relations, Marital Conflict, Marital Relations, Mother Child Relations, Parent Child Relations, Parental Attitudes, Parental Role, Sibling Relations] 578, 598, 605, 616, 635, 643, 653, 656, 696, 859, 863, 870, 905, 952, 993, 1007, 1123, 1144
Family Size 687, 807
Family Socioeconomic Level 639, 862, 1123
Family Structure [See Also Birth Order, Extended Family, Family Size, Mother Absence, Nuclear Family, Parental Absence, Schizophrenogenic Family] 643, 657, 798, 903, 984
Family Therapy 992, 993, 1001, 1002, 1007, 1008
Family [See Also Related Terms] 626, 1698
Fantasy (Defense Mechanism) 599, 837, 1480
Farmers [See Agricultural Workers]
Father Child Relations 642
Fathers 560
Fatigue 350, 437, 1689
Fatty Acids 420, 473
Fear 291, 353, 768, 1037
Feeble-mindedness [See Mental Retardation]
Feedback [See Also Biofeedback, Knowledge of Results, Sensory Feedback, Visual Feedback] 709, 897, 1013, 1016, 1039, 1210, 1268, 1276, 1282, 1298, 1353, 1409, 1419, 1445, 1519, 1538
Feeding Behavior (Animal) [See Animal Feeding Behavior]
Feelings [See Emotions]
Feet (Anatomy) 1094
Felonies [See Crime]
Female Animals 236, 369, 384, 466
Female Criminals 1181
Female Delinquents 954, 1181
Female Genitalia [See Vagina]
Females (Human) [See Human Females]
Femininity 766
Femoral Nerve [See Spinal Nerves]
Fetus 298

BRIEF SUBJECT INDEX

Galvanic Skin Response 356, 897, 1633
Gambling 211, 516
Games [See Prisoners Dilemma Game]
Ganglia [See Also Basal Ganglia] 311, 409, 458
Ganglion Blocking Drugs [See Nicotine]
Gangs (Juvenile) [See Juvenile Gangs]
Gastrointestinal Disorders [See Colitis, Gastrointestinal Ulcers]
Gastrointestinal System [See Also Intestines] 342, 932
Gastrointestinal Ulcers 378
Gastropods [See Mollusca]
General Anesthetics [See Also Methohexital] 1115
General Hospital Psychiatric Units [See Psychiatric Hospitals]
General Practitioners [See Also Family Physicians] 839, 917
Generalization (Cognitive) [See Cognitive Generalization]
Generalization (Stimulus) [See Stimulus Generalization]
Generation Gap 654

Genetic Disorders [See Also Abnormal Development, Disorders, Group Syndromes, Heredity, Hereditary Disorders, 611]
 Genetic [See Also Beyond Terms, 792]
 Genetic 300, 301, 302, 303, 304, 305, 306, 307, 308, 309, 310, 311, 312, 313, 314, 315, 316, 317, 318, 319, 320, 321, 322, 323, 324, 325, 326, 327, 328, 329, 330, 331, 332, 333, 334, 335, 336, 337, 338, 339, 340, 341, 342, 343, 344, 345, 346, 347, 348, 349, 350, 351, 352, 353, 354, 355, 356, 357, 358, 359, 360, 361, 362, 363, 364, 365, 366, 367, 368, 369, 370, 371, 372, 373, 374, 375, 376, 377, 378, 379, 380, 381, 382, 383, 384, 385, 386, 387, 388, 389, 390, 391, 392, 393, 394, 395, 396, 397, 398, 399, 400, 401, 402, 403, 404, 405, 406, 407, 408, 409, 410, 411, 412, 413, 414, 415, 416, 417, 418, 419, 420, 421, 422, 423, 424, 425, 426, 427, 428, 429, 430, 431, 432, 433, 434, 435, 436, 437, 438, 439, 440, 441, 442, 443, 444, 445, 446, 447, 448, 449, 450, 451, 452, 453, 454, 455, 456, 457, 458, 459, 460, 461, 462, 463, 464, 465, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499, 500, 501, 502, 503, 504, 505, 506, 507, 508, 509, 510, 511, 512, 513, 514, 515, 516, 517, 518, 519, 520, 521, 522, 523, 524, 525, 526, 527, 528, 529, 530, 531, 532, 533, 534, 535, 536, 537, 538, 539, 540, 541, 542, 543, 544, 545, 546, 547, 548, 549, 550, 551, 552, 553, 554, 555, 556, 557, 558, 559, 560, 561, 562, 563, 564, 565, 566, 567, 568, 569, 570, 571, 572, 573, 574, 575, 576, 577, 578, 579, 580, 581, 582, 583, 584, 585, 586, 587, 588, 589, 590, 591, 592, 593, 594, 595, 596, 597, 598, 599, 600, 601, 602, 603, 604, 605, 606, 607, 608, 609, 610, 611, 612, 613, 614, 615, 616, 617, 618, 619, 620, 621, 622, 623, 624, 625, 626, 627, 628, 629, 630, 631, 632, 633, 634, 635, 636, 637, 638, 639, 640, 641, 642, 643, 644, 645, 646, 647, 648, 649, 650, 651, 652, 653, 654, 655, 656, 657, 658, 659, 660, 661, 662, 663, 664, 665, 666, 667, 668, 669, 670, 671, 672, 673, 674, 675, 676, 677, 678, 679, 680, 681, 682, 683, 684, 685, 686, 687, 688, 689, 690, 691, 692, 693, 694, 695, 696, 697, 698, 699, 700, 701, 702, 703, 704, 705, 706, 707, 708, 709, 710, 711, 712, 713, 714, 715, 716, 717, 718, 719, 720, 721, 722, 723, 724, 725, 726, 727, 728, 729, 730, 731, 732, 733, 734, 735, 736, 737, 738, 739, 740, 741, 742, 743, 744, 745, 746, 747, 748, 749, 750, 751, 752, 753, 754, 755, 756, 757, 758, 759, 760, 761, 762, 763, 764, 765, 766, 767, 768, 769, 770, 771, 772, 773, 774, 775, 776, 777, 778, 779, 780, 781, 782, 783, 784, 785, 786, 787, 788, 789, 790, 791, 792, 793, 794, 795, 796, 797, 798, 799, 800, 801, 802, 803, 804, 805, 806, 807, 808, 809, 810, 811, 812, 813, 814, 815, 816, 817, 818, 819, 820, 821, 822, 823, 824, 825, 826, 827, 828, 829, 830, 831, 832, 833, 834, 835, 836, 837, 838, 839, 840, 841, 842, 843, 844, 845, 846, 847, 848, 849, 850, 851, 852, 853, 854, 855, 856, 857, 858, 859, 860, 861, 862, 863, 864, 865, 866, 867, 868, 869, 870, 871, 872, 873, 874, 875, 876, 877, 878, 879, 880, 881, 882, 883, 884, 885, 886, 887, 888, 889, 890, 891, 892, 893, 894, 895, 896, 897, 898, 899, 900, 901, 902, 903, 904, 905, 906, 907, 908, 909, 910, 911, 912, 913, 914, 915, 916, 917, 918, 919, 920, 921, 922, 923, 924, 925, 926, 927, 928, 929, 930, 931, 932, 933, 934, 935, 936, 937, 938, 939, 940, 941, 942, 943, 944, 945, 946, 947, 948, 949, 950, 951, 952, 953, 954, 955, 956, 957, 958, 959, 960, 961, 962, 963, 964, 965, 966, 967, 968, 969, 970, 971, 972, 973, 974, 975, 976, 977, 978, 979, 980, 981, 982, 983, 984, 985, 986, 987, 988, 989, 990, 991, 992, 993, 994, 995, 996, 997, 998, 999, 1000, 1001, 1002, 1003, 1004, 1005, 1006, 1007, 1008, 1009, 1010, 1011, 1012, 1013, 1014, 1015, 1016, 1017, 1018, 1019, 1020, 1021, 1022, 1023, 1024, 1025, 1026, 1027, 1028, 1029, 1030, 1031, 1032, 1033, 1034, 1035, 1036, 1037, 1038, 1039, 1040, 1041, 1042, 1043, 1044, 1045, 1046, 1047, 1048, 1049, 1050, 1051, 1052, 1053, 1054, 1055, 1056, 1057, 1058, 1059, 1060, 1061, 1062, 1063, 1064, 1065, 1066, 1067, 1068, 1069, 1070, 1071, 1072, 1073, 1074, 1075, 1076, 1077, 1078, 1079, 1080, 1081, 1082, 1083, 1084, 1085, 1086, 1087, 1088, 1089, 1

Major Tranquillizers [See Neuroleptic Drugs]
Maladjustment (Emotional) [See Emotional Adjustment]
Maladjustment (Social) [See Social Adjustment]
Male Animals 261, 343, 375, 384, 394
Male Castration 360, 361, 395
Male Delinquents 1127, 1177, 1189
Male Homosexuality 354, 680
Male Orgasm [See Premature Ejaculation]
Males (Human) [See Human Males]
Malingering 857
Malnutrition [See Nutritional Deficiencies]
Mammals [See Bats, Cats, Chimpanzees, Dogs, Dolphins, Goats, Guinea Pigs, Hamsters, Lemurs, Mice, Monkeys, Norway Rats, Pigs, Rabbits, Rats, Rodents]
Mammary Bodies (Hypothalamic) [See Hypothalamus]
Man Machine Systems 36, 462, 1686
Man Machine Systems Design 19
Management Methods 1656, 1668, 1672, 1675, 1676
Management Personnel [See Also Middle Level Managers] 1651, 1653, 1654, 1656, 1657, 1666, 1667, 1668, 1671, 1674, 1678
Management Planning 1670
Management Training 1653, 1667, 1670, 1674, 1677, 1681
Management [See Also Related Terms] 1677
Mania [See Also Hypomania, Pyromania] 840, 990, 1060
Manic Depression 853
Manic Depressive Psychosis 843, 1081
Manufacturing [See Business]
Marathon Group Therapy 998, 1003, 1015
Marihuana 414, 456, 462
Marihuana Usage 456, 701, 702, 704, 1364
Marijuana [See Marihuana]
Marital Adjustment [See Marital Relations]
Marital Conflict 842, 1012
Marital Problems [See Marital Relations]
Marital Relations [See Also Marital Conflict] 636, 638, 640, 644, 645, 646, 648, 657, 842, 994
Marital Status 644, 685, 1443
Markov Chains 85, 784, 1627
Marriage 641, 654, 680, 841
Marriage Attitudes 638, 650
Marriage Counseling 1001, 1002, 1010, 1012
Marriage Therapy [See Marriage Counseling]
Married Couples [See Spouses]
Masculinity 766

BRIEF SUBJECT INDEX

- Masking [See Also Auditory Masking; Visual Masking] 18
- Masochism 1
- Mass Media [See Also Broadcasting; Journalism; Newspapers; Radio; Television] 109
- Maternal Behavior (Animal) [See Animal Maternal Behavior]
- Maternal Behavior (Human) [See Mother-Child Relations]
- Maternal Deprivation [See Animal Maternal Deprivation; Maternal Absence; Mother-Child Relations]
- Mates (Humans) [See Spouses]
- Mathematical Ability 1602
- Mathematical Modeling 112, 119, 135, 338, 462
- Mathematical Psychology 74
- Mathematics (Concepts) [See Also Algorithms; Number Systems; Numbers (Numerals)] 1416
- Mathematics Achievement 930, 1328, 1367, 1406, 1416, 1418, 1453, 1454
- Mathematics Education 1264, 1300, 1314, 1328, 1333, 1393, 1464
- Mating Behavior (Animal) [See Animal Mating Behavior]
- Maturation [See Human Development]
- Maturity (Emotional) [See Emotional Maturity]
- Meaning [See Verbal Meaning; Word Meaning]
- Meaningfulness 201
- Measurement [See Also Related Terms] 59, 327, 564, 941, 1035, 1687, 1688
- Mechanoreceptors 107, 316
- Media (Communications) [See Communications Media]
- Media (Educational) [See Instructional Media]
- Media (Mass) [See Mass Media]
- Median Nerve [See Spinal Nerves]
- Mediation (Cognitive) [See Cognitive Mediation]
- Medical Diagnosis [See Also Cardiography; Electrocardiography; Electroencephalography; Electromyography; Galvanic Skin Response; Ophthalmologic Examination] 915
- Medical Education [See Also Psychiatric Training] 1214, 1219, 1227, 1230, 1235, 1567
- Medical History [See Patient History]
- Medical Patients 18, 910, 1169
- Medical Personnel [See Also Attendants (Institutions); Family Physicians; General Practitioners; Nurses; Physicians; Psychiatric Hospital Staff; Psychiatric Nurses; Psychiatrists; Public Health Service Nurses] 1190, 1219
- Medical Residency 1234, 1236
- Medical Sciences [See Also Child Psychiatry; Community Psychiatry; Dentistry; Neurology; Neuropathology; Neuropsychiatry; Pediatrics; Psychiatry; Psychopathology] 917, 921, 940, 1055
- Medical Students 1215, 1216, 1219, 1220, 1227, 1230, 1232, 1235, 1623
- Medical Treatment (General) 1117
- Medication [See Drug Therapy]
- Medicine (Science of) [See Medical Sciences]
- Meditation 1030, 1197
- Melancholia [See Depression (Emotion)]
- Melancholy [See Sadness]
- Melleril [See Thioridazine]
- Mendacity 1
- Memory [See Also Amnesia; Term Memory; Short-Term Memory] 105, 193, 197, 198, 199, 200, 201, 202, 203
- Memory Disorders [See Amnesia]
- Memoranda 101, 411
- Messengers 10
- Menstrual Cycle [See Menstruation]
- Menstruation [See Also Menstrual Cycle]
- Mental Deficiencies [See Mental Retardation]
- Mental Disorders [See Also Related Terms] 607, 672, 677, 771, 836, 840, 861, 862, 863, 1102, 1109
- Mental Health [See Also Community Mental Health] 44, 604, 640, 879
- Mental Health Centers (Community) [See Community Mental Health Centers]
- Mental Health Personnel [See Also Physicians; Psychiatric Social Workers; Nurses; Psychiatrists; Psychotherapists; School Psychologists] 1167, 1205, 1225, 1227, 1228, 1229
- Mental Health Personnel Supply 1237
- Mental Health Program Evaluation 1177, 1180, 1195, 1178, 1409
- Mental Health Program [See Also Home Visiting Programs; Hot Line Services] 1110, 1124, 1125, 1142, 1143, 1151, 1178
- Mental Health Training (Community) [See Community Mental Health Training]
- Mental Hospitals [See Psychiatric Hospitals]
- Mental Illness [See Mental Disorders]
- Mental Illness (Attitudes Toward) 586, 608
- Mental Retardation [See Also Borderline Mental Retardation; Downs Syndrome] 829, 891, 911, 950, 1110, 1259
- Mental Retardation (Attit Toward) 1280
- Mentally Retarded [See Also Educable Mentally Retarded; Institutionalized Mentally Retarded; Profoundly Mentally Retarded; Severely Mentally Retarded; Trainable Mentally Retarded] 68, 826, 893, 894, 895, 897, 935, 950, 1026, 1123, 1167, 1172, 1324, 1522, 1525, 1536
- Mescaline 418, 476
- Mesencephalon [See Also Optic Lobe; Superior Colliculus] 364
- Messages 145, 494, 499
- Metabolism [See Also Anabolism] 363
- Metabolism Disorders [See Also Diabetes Insipidus] 911
- Metallic Elements [See Lithium; Magnesium]
- Methadone 1200, 1205, 1206
- Methadone Maintenance [See Drug Rehabilitation; Methadone]
- Methamphetamine 424
- Methedrine [See Methamphetamine]
- Methodology [See Also Related Terms] 612, 1184
- Methohexital 1082
- Methylatropine [See Atropine]
- Methylphenidate 430, 463
- Mexican Americans 606, 643, 1220, 1252, 1423, 1426, 1432, 1497, 1507, 1569
- Mexico 569
- Mice 224, 236, 266, 275, 281, 283, 288, 299, 300, 345, 348, 367, 384, 392, 407, 415, 433, 434, 455, 459, 475, 477
- Middle Aged 304, 600, 640, 741, 1140
- Ministry (Class 87, 932, 935, 940, 941, 1047, 1010)
- Ministry (Class Attendance) 664
- Ministry (Fair)
- Ministry (Lateral Management) 107
- Ministry (Human) [See Human Ministry]
- Ministry (Behavior Animal) 106
- Ministry (Mentally Retarded) [See Education Ministry]
- Ministry (Therapy) [See Therapeutic Ministry]
- Military Disobedience 107
- Military Officers [See Commissioned Officers]
- Military Personnel [See Also Air Force Personnel; Army Personnel; Commissioned Officers; Drafts; Enlisted Military Personnel; Navy Personnel] 1647
- Military Recruitment 664
- Military Training 519, 1638, 1640, 1641, 1642, 1644, 1646, 1647, 1649, 1660, 1661, 1662, 1663, 1665

Nonverbal Communication [See Also Body Language, Eye Contact, Facial

BRIEF SUBJECT INDEX

- Expressive Styles 400, 405, 409, 410, 414, 415, 416, 417, 418, 419, 420, 421, 422, 423, 424, 425, 426, 427, 428, 429, 430, 431, 432, 433, 434, 435, 436, 437, 438, 439, 440, 441, 442, 443, 444, 445, 446, 447, 448, 449, 450, 451, 452, 453, 454, 455, 456, 457, 458, 459, 460, 461, 462, 463, 464, 465, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499, 500, 501, 502, 503, 504, 505, 506, 507, 508, 509, 510, 511, 512, 513, 514, 515, 516, 517, 518, 519, 520, 521, 522, 523, 524, 525, 526, 527, 528, 529, 530, 531, 532, 533, 534, 535, 536, 537, 538, 539, 540, 541, 542, 543, 544, 545, 546, 547, 548, 549, 550, 551, 552, 553, 554, 555, 556, 557, 558, 559, 560, 561, 562, 563, 564, 565, 566, 567, 568, 569, 570, 571, 572, 573, 574, 575, 576, 577, 578, 579, 580, 581, 582, 583, 584, 585, 586, 587, 588, 589, 590, 591, 592, 593, 594, 595, 596, 597, 598, 599, 600, 601, 602, 603, 604, 605, 606, 607, 608, 609, 610, 611, 612, 613, 614, 615, 616, 617, 618, 619, 620, 621, 622, 623, 624, 625, 626, 627, 628, 629, 630, 631, 632, 633, 634, 635, 636, 637, 638, 639, 640, 641, 642, 643, 644, 645, 646, 647, 648, 649, 650, 651, 652, 653, 654, 655, 656, 657, 658, 659, 660, 661, 662, 663, 664, 665, 666, 667, 668, 669, 670, 671, 672, 673, 674, 675, 676, 677, 678, 679, 680, 681, 682, 683, 684, 685, 686, 687, 688, 689, 690, 691, 692, 693, 694, 695, 696, 697, 698, 699, 700, 701, 702, 703, 704, 705, 706, 707, 708, 709, 710, 711, 712, 713, 714, 715, 716, 717, 718, 719, 720, 721, 722, 723, 724, 725, 726, 727, 728, 729, 730, 731, 732, 733, 734, 735, 736, 737, 738, 739, 740, 741, 742, 743, 744, 745, 746, 747, 748, 749, 750, 751, 752, 753, 754, 755, 756, 757, 758, 759, 760, 761, 762, 763, 764, 765, 766, 767, 768, 769, 770, 771, 772, 773, 774, 775, 776, 777, 778, 779, 780, 781, 782, 783, 784, 785, 786, 787, 788, 789, 790, 791, 792, 793, 794, 795, 796, 797, 798, 799, 800, 801, 802, 803, 804, 805, 806, 807, 808, 809, 810, 811, 812, 813, 814, 815, 816, 817, 818, 819, 820, 821, 822, 823, 824, 825, 826, 827, 828, 829, 830, 831, 832, 833, 834, 835, 836, 837, 838, 839, 840, 841, 842, 843, 844, 845, 846, 847, 848, 849, 850, 851, 852, 853, 854, 855, 856, 857, 858, 859, 860, 861, 862, 863, 864, 865, 866, 867, 868, 869, 870, 871, 872, 873, 874, 875, 876, 877, 878, 879, 880, 881, 882, 883, 884, 885, 886, 887, 888, 889, 890, 891, 892, 893, 894, 895, 896, 897, 898, 899, 900, 901, 902, 903, 904, 905, 906, 907, 908, 909, 910, 911, 912, 913, 914, 915, 916, 917, 918, 919, 920, 921, 922, 923, 924, 925, 926, 927, 928, 929, 930, 931, 932, 933, 934, 935, 936, 937, 938, 939, 940, 941, 942, 943, 944, 945, 946, 947, 948, 949, 950, 951, 952, 953, 954, 955, 956, 957, 958, 959, 960, 961, 962, 963, 964, 965, 966, 967, 968, 969, 970, 971, 972, 973, 974, 975, 976, 977, 978, 979, 980, 981, 982, 983, 984, 985, 986, 987, 988, 989, 990, 991, 992, 993, 994, 995, 996, 997, 998, 999, 1000
- Expressive Styles 400, 405, 409, 410, 414, 415, 416, 417, 418, 419, 420, 421, 422, 423, 424, 425, 426, 427, 428, 429, 430, 431, 432, 433, 434, 435, 436, 437, 438, 439, 440, 441, 442, 443, 444, 445, 446, 447, 448, 449, 450, 451, 452, 453, 454, 455, 456, 457, 458, 459, 460, 461, 462, 463, 464, 465, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499, 500, 501, 502, 503, 504, 505, 506, 507, 508, 509, 510, 511, 512, 513, 514, 515, 516, 517, 518, 519, 520, 521, 522, 523, 524, 525, 526, 527, 528, 529, 530, 531, 532, 533, 534, 535, 536, 537, 538, 539, 540, 541, 542, 543, 544, 545, 546, 547, 548, 549, 550, 551, 552, 553, 554, 555, 556, 557, 558, 559, 560, 561, 562, 563, 564, 565, 566, 567, 568, 569, 570, 571, 572, 573, 574, 575, 576, 577, 578, 579, 580, 581, 582, 583, 584, 585, 586, 587, 588, 589, 590, 591, 592, 593, 594, 595, 596, 597, 598, 599, 600, 601, 602, 603, 604, 605, 606, 607, 608, 609, 610, 611, 612, 613, 614, 615, 616, 617, 618, 619, 620, 621, 622, 623, 624, 625, 626, 627, 628, 629, 630, 631, 632, 633, 634, 635, 636, 637, 638, 639, 640, 641, 642, 643, 644, 645, 646, 647, 648, 649, 650, 651, 652, 653, 654, 655, 656, 657, 658, 659, 660, 661, 662, 663, 664, 665, 666, 667, 668, 669, 670, 671, 672, 673, 674, 675, 676, 677, 678, 679, 680, 681, 682, 683, 684, 685, 686, 687, 688, 689, 690, 691, 692, 693, 694, 695, 696, 697, 698, 699, 700, 701, 702, 703, 704, 705, 706, 707, 708, 709, 710, 711, 712, 713, 714, 715, 716, 717, 718, 719, 720, 721, 722, 723, 724, 725, 726, 727, 728, 729, 730, 731, 732, 733, 734, 735, 736, 737, 738, 739, 740, 741, 742, 743, 744, 745, 746, 747, 748, 749, 750, 751, 752, 753, 754, 755, 756, 757, 758, 759, 760, 761, 762, 763, 764, 765, 766, 767, 768, 769, 770, 771, 772, 773, 774, 775, 776, 777, 778, 779, 780, 781, 782, 783, 784, 785, 786, 787, 788, 789, 790, 791, 792, 793, 794, 795, 796, 797, 798, 799, 800, 801, 802, 803, 804, 805, 806, 807, 808, 809, 810, 811, 812, 813, 814, 815, 816, 817, 818, 819, 820, 821, 822, 823, 824, 825, 826, 827, 828, 829, 830, 831, 832, 833, 834, 835, 836, 837, 838, 839, 840, 841, 842, 843, 844, 845, 846, 847, 848, 849, 850, 851, 852, 853, 854, 855, 856, 857, 858, 859, 860, 861, 862, 863, 864, 865, 866, 867, 868, 869, 870, 871, 872, 873, 874, 875, 876, 877, 878, 879, 880, 881, 882, 883, 884, 885, 886, 887, 888, 889, 890, 891, 892, 893, 894, 895, 896, 897, 898, 899, 900, 901, 902, 903, 904, 905, 906, 907, 908, 909, 910, 911, 912, 913, 914, 915, 916, 917, 918, 919, 920, 921, 922, 923, 924, 925, 926, 927, 928, 929, 930, 931, 932, 933, 934, 935, 936, 937, 938, 939, 940, 941, 942, 943, 944, 945, 946, 947, 948, 949, 950, 951, 952, 953, 954, 955, 956, 957, 958, 959, 960, 961, 962, 963, 964, 965, 966, 967, 968, 969, 970, 971, 972, 973, 974, 975, 976, 977, 978, 979, 980, 981, 982, 983, 984, 985, 986, 987, 988, 989, 990, 991, 992, 993, 994, 995, 996, 997, 998, 999, 1000
- Obesity 912, 1024, 1045, 1046, 1095
Objectives (Organizational) [See Organizational Objectives]
Observation Methods 506, 1307, 1494
Observational Learning 186, 241, 892, 1429
Observers 668
Obsessions 812
Obturator Nerve [See Spinal Nerves]
Occipital Lobe [See Visual Cortex]
Occupation (Parental) [See Parental Occupation]
Occupational Adjustment 1638
Occupational Aspirations 558, 1252, 1294, 1547, 1559, 1562
Occupational Attitudes 605, 1290, 1294, 1554, 1559, 1620, 1625, 1629
Occupational Choice 823, 1226, 1227, 1427, 1621, 1624, 1625, 1627
Occupational Guidance 1549, 1554, 1562, 1598, 1601, 1603
Occupational Interest Measures [See Also Strong Vocational Interest Blank] 1621
Occupational Interests 1470, 1548, 1601, 1620
Occupational Mobility 611, 1253, 1624
Occupational Preference 1547, 1621
Occupational Success Prediction 1283, 1678
Occupational Tenure [See Also Teacher Tenure] 1610
Occupations [See Also Related Terms] 636, 823, 1622, 1623, 1626, 1627
Oculomotor Response [See Eye Movements]
Odor Discrimination 225, 265
Oedipal Complex 837
Offenders (Adult) [See Criminals]
Offenders (Juvenile) [See Juvenile Delinquents]
Officers (Commissioned) [See Commissioned Officers]
- Opioids [See Also Narcotics]
Old Age [See Aging]
Olfactory Bulb 166
Olfactory Perception [See Also Olfactory Discrimination] 57, 223, 111, 166, 167
Oligophrenia [See Mental Retardation]
On The Job Training 1316, 1639
Onset (Disorders) 41
Ontogeny [See Development]
Open Classroom Method 1286, 1380, 1379, 1469, 1647
Open Field Behavior (Animal) [See Animal Open Field Behavior]
Operant Conditioning [See Also Avoidance Conditioning, Conditioned Emotional Responses, Escape Conditioning, Field Conditioning] 51, 141, 142, 283, 284, 285, 286, 287, 288, 289, 290, 291, 292, 293, 294, 295, 336, 399, 413, 414, 424, 441, 446, 471, 1032, 1038, 1041, 1048, 1055, 1057, 1457
Ophthalmia 1033, 1037, 1040, 1058
Ophthalmologic Examination 1092
Opiates [See Also Narcotics, Heroin, Morphine] 417, 675, 1089, 1196
Opinion (Public) [See Public Opinion]
Opinion Change [See Attitude Change]
Opinion Questionnaires [See Attitude Measures]
Opinion Surveys [See Attitude Measures]
Opinions [See Attitudes]
Opium Alkaloids [See Opiates]
Opium Derivative Drugs [See Opiates]
Opium Derivatives [See Opiates]
Optic Lobe 329, 1682
Optical Illusions [See Illusions (Perception)]
Optometry 1589
Oral Communication [See Verbal Communication]
Oral Contraceptives 428
Organ of Corti [See Cochlea]
Organ Transplantation 938
Organic Brain Syndromes [See Delirium Tremens, Presenile Dementia, Senile Dementia]
Organic Therapies [See Drug Therapy, Electroconvulsive Shock Therapy]
Organization (Spatial) [See Spatial Organization]
Organizational Change 1242
Organizational Climate 1290, 1504
Organizational Development 1126, 1136, 1397, 1630, 1667
Organizational Goals [See Organizational Objectives]
Organizational Objectives 1191
Organizational Structure 589, 1397, 1493, 1681, 1683
Organizations [See Also Professional Organizations] 1107
Orgasm [See Premature Ejaculation]
Orientation (Perceptual) [See Perceptual Orientation]
Orientation (Spatial) [See Spatial Orientation (Perception)]
Orienting Responses 187, 349, 393
Originality [See Creativity]
Orthography 167
Orthopedically Handicapped [See Physically Handicapped]
Outcomes (Psychotherapeutic) [See Psychotherapeutic Outcomes]
Outpatient Treatment 1129, 1162
Outpatients 981
Ovariectomy 369, 370, 374, 377, 428
- Ocular Disorders [See Eye Disorders]
Ovaries [See Female Reproductive System]
Overachievement (Academic) [See Academic Achievement]
Overpopulation 232, 144, 64, 165, 1691, 1694, 1697, 1703
Overweight [See Obesity]
Oxidases [See Monooxygenase Oxidases]
- Pain [See Headache]
Pain Perception [See Pain Thresholds]
Pain Relieving Drugs [See Analgesic Drugs]
Pain Thresholds 47
Partial Association Learning 181, 195
Palsy [See Paralysis]
Paradoxical Sleep [See REM Sleep]
Paralysis [See Also Cerebral Palsy, Parkinsons Disease] 937
Paralytic Agitation [See Parkinsons Disease]
Paramedical Personnel [See Attendants (Institutions)]
Paramedical Sciences [See Nursing, Optometry, Pharmacology, Physical Therapy, Psychopharmacology]
Parametric Statistical Tests 83
Paranoia (Psychosis) 812
Paranoid Personality 904
Paraprofessional Education 1219, 1221
Paraprofessional Personnel [See Also Attendants (Institutions), Teacher Aides] 1121, 1124, 1221, 1237, 1304, 1478
Parapsychological Phenomena 5
Parapsychology [See Also Parapsychological Phenomena] 5
Parasympathetic Nervous System [See Vagus Nerve]
Parasympatholytic Drugs [See Cholinergic Blocking Drugs]
Parent Child Communication 642
Parent Child Relations [See Also Father Child Relations, Mother Child Relations, Parental Attitudes] 505, 560, 575, 630, 637, 639, 654, 727, 842, 1458, 1574, 1590
Parent Educational Background 611, 622, 1446
Parental Absence [See Also Mother Absence] 1141
Parental Attitudes 632, 640, 647, 649, 654, 862, 1175, 1243, 1449, 1467, 1507, 1521
Parental Influence [See Parent Child Relations]
Parental Occupation 611, 622, 657
Parental Role 645, 657, 658
Parents [See Also Adoptive Parents, Fathers, Mothers, Unwed Mothers] 560, 630, 651, 858, 887, 1004, 1005, 1123, 1146, 1147, 1243, 1280, 1449
Parkinsons Disease 904, 919, 1063, 1067
Parks (Recreational) [See Recreation Areas]
Partial Reinforcement [See Reinforcement Schedules]
Partially Hearing Impaired 1534

 Verbal Reinforcement [See Also Praise] 518
 Verbalization [See Verbal Communication]
 Verbs 589
 Verification (of Theories) [See Theory, Verification]
 Vertebrates [See Also Bats, Cats, Chickens, Chimpanzees, Dogs, Dolphins, Ducks, Fishes, Goats, Goldfish, Guinea Pigs, Hamsters, Lemmings, Mice, Monkeys, Norway Rats, Pigeons, Rats, Quails, Rabbits, Rats, Rodents, Salamanders, Sea Gulls, Snakes] 808
 Vestibular Apparatus 315, 1615
 Vestibular Stimulation [See Somesthetic Stimulation]
 Veterans (Military) [See Military Veterans]
 Vibration 109
 Vibrotactile Thresholds 107, 108
 Victimization 660, 670, 690
 Videotape Instruction 1215
 Videotapes 506, 1016, 1195, 1230, 1282, 1312, 1484, 1556
 Vigilance 222
 Violence 9, 56, 705, 770
 Viral Disorders [See Encephalitis]
 Vision [See Binocular Vision, Brightness Perception, Color Perception, Dark Adaptation, Monocular Vision, Visual Discrimination, Visual Field, Visual Perception, Visual Thresholds]
 Visitation (Hospital) [See Institution Visitation]
 Visitation (Institution) [See Institution Visitation]
 Visitation (Psychiatric Hospital) [See Institution Visitation]
 Visual Cortex 393, 405, 432, 453
 Visual Discrimination 114, 115, 324, 391, 393, 406, 450, 480
 Visual Displays 202
 Visual Evoked Potentials 307, 313, 337, 432
 Visual Feedback 102
 Visual Field 115
 Visual Masking 122, 126, 810
 Visual Perception [See Also Binocular Vision, Brightness Perception, Color Perception, Dark Adaptation, Monocular Vision, Visual Discrimination, Visual Field, Visual Thresholds] 88, 93, 110, 116, 117, 120, 124, 125, 126, 127, 129, 130, 131, 133, 134, 137, 138, 156, 192, 231, 235, 313, 339, 621, 948, 1535
 Visual Stimulation [See Also Illumination, Prismatic Stimulation, Tachistoscopic Presentation, Visual Feedback] 86, 111, 117, 118, 123, 200, 315, 326, 328, 333, 339, 909, 925, 1519
 Visual Thresholds [See Also Dark Adaptation] 110, 111
 Visual Tracking 110
 Visually Handicapped [See Blind]
 Vitamins [See Nutrient Acid]
 Vocabulary [See Also Sight Vocabulary] 880
 Vocalization [See Also Animal Vocalizations, Crying, Infant Vocalization] 569, 732, 1416
 Vocalization (Infant) [See Infant Vocalization]
 Vocalizations (Animal) [See Animal Vocalizations]
 Vocational Adjustment [See Occupational Adjustment]
 Vocational Aspirations [See Occupational Aspirations]
 Vocational Choice [See Occupational Choice]
 Vocational Counseling [See Occupational Guidance]
 Vocational Counselors 1192, 1240, 1598
 Vocational Education 1292, 1366, 1603, 1621
 Vocational Guidance [See Occupational Guidance]
 Vocational Interests [See Occupational Interests]
 Vocational Mobility [See Occupational Mobility]
 Vocational Preference [See Occupational Preference]
 Vocational Rehabilitation 1022, 1185, 1192
 Vocational School Students 1621
 Vocations [See Occupations]
 Voice [See Crying, Infant Vocalization]
 Volunteer Personnel 816, 1613
 Volunteers (Experiment) [See Experiment Volunteers]
 Vomit Inducing Drugs [See Emetic Drugs]
 Voting Behavior 671
 Vowels 55, 528
 Wages [See Salaries]
 Wakefulness 304, 310, 320, 340, 352, 920
 War 583, 970
 Warning Signal [See Signal Detection (Perception)]
 Water Intake 412, 448
 Webster Adult Intelligence Scale 1046
 Webster Intelligence Scale Children 66, 1529, 1560
 Weight (Body) [See Body Weight]
 Weight Perception 94, 112, 317
 Weightlessness 42
 Welfare [See Welfare Services (Government)]
 Welfare Services (Government) 192, 193
 West German Federal Republic 1273
 White Collar Workers [See Also Clerical Personnel, Managers, Personnel]
 White Noise 43
 White Rats [See Rats]
 Whites [See Caucasians]
 Wide Range Achievement Test 1524, 1560
 Widowers 600
 Widows 600
 Withdrawal (Drug) [See Drug Withdrawal]
 Withdrawal Effects (Drug) [See Drug Withdrawal Effects]
 Wives 648, 757, 884
 Women's Liberation Movement 30, 615, 1398
 Word Associations 160, 492
 Word Blindness (Aphasia) [See Aphasia]
 Word Deafness [See Aphasia]
 Word Meaning 42, 157, 160, 492, 537, 586, 770
 Words (Phonetic Units) 110, 131, 492, 529, 749
 Words (Vocabulary) [See Vocabulary]
 Work (Attitudes Toward) 1640, 1664
 Work Study Programs [See Educational Programs]
 Workday Shifts 966
 Working Conditions [See Workday Shifts]
 Worms [See Planarians]
 Worship [See Religious Practices]
 Writing (Creative) [See Literature]
 Writing (Handwriting) [See Handwriting]
 Written Language [See Handwriting, Letters (Alphabet), Numbers (Numerals)]
 Xylocaine [See Lidocaine]
 Young Adults 304, 332, 368, 617, 634, 673, 1010, 1021, 1050, 1140, 1203, 1625
 Youth (Adolescents) [See Adolescents]
 Youth (Adults) [See Young Adults]
 Youth (Children) [See Children]

AUTHOR INDEX

The Author Index is intended to be a name index only and not a person index. "Adams, P." will be listed separately from "Adams, Paul" even though the names may refer to the same person; however, two listings for "Adams, P." may refer to two different authors. All authors are listed, not just primary authors.

Guide to PsycINFO

Psychological Abstracts Information Services (PsycINFO) is a family of interrelated information services that provides a variety of ways to access the world's literature in psychology and related behavioral and social sciences. **PsycINFO consists of:**

PsycINFO Data Base. Contains records published in the *Psychological Abstracts* journal from 1967 to present.

PAGE *two*

Psychological Abstracts (PA) journal. The comprehensive monthly compilation of nonevaluative summaries of the world's scientific literature in psychology and related disciplines. **PA's Volume Index**—an expanded subject and integrated author index—is published twice a year.

PAGE *three*

Three-Year Cumulative Indexes to PA. Author and subject indexes for all entries in the *PA* journal for 1969-1971 and 1972-1974.

PAGE *seven*

Thesaurus of Psychological Index Terms. An unambiguous and hierarchically structured vocabulary of 4,000 terms and term relationships used by psychology and related disciplines.

PAGE *eight*

PADAT (PA Direct Access Terminal). Direct interaction with the PsycINFO data base by researchers, teachers and administrators conducting information searches on a computer terminal in their own facilities.

PAGE *nine*

PATELL (PA Tape Edition Lease or Licensing). Magnetic tapes of PsycINFO records to institutions for annual lease or license. Designed for use by information analysts and dissemination centers.

PAGE *nine*

PASAR (PA Search and Retrieval). Retrospective search and retrieval service. Printouts by mail in response to individual requester's information needs as specified on a **PASAR** request form.

PAGE *ten*

PsycINFO Data Base

THREE KINDS OF RECORDS

Journal Article Abstract

The PsycINFO data base contains nonevaluative summaries of the world's literature in psychology and related disciplines published in the **Psychological Abstracts** journal from 1967 to the present. Each year PsycINFO scans materials from over 850 periodicals and about 1,500 books, technical reports, and monographs. The materials selected for inclusion in the data base are original, published contributions to the field of psychology.

Articles from periodicals are generally abstracted; books are cited, with an annotation if the title is not definitive; separates (i.e., technical reports, monographs, etc.) are cited, annotated, or abstracted according to their relevancy to the behavioral and social science community. The following examples of the three different kinds of PsycINFO records are number coded to provide definition of their elements.

18327 ²Howard, R. Lee.; Glendenning, Robert L. & Meyer, Donald R. ⁹(Ohio State U.) ¹Motivational control of retrograde amnesia: Further explorations and effects. *Journal of Comparative & Physiological Psychology* 1974(Feb) Vol. 86(2) 187-192. ⁶Reports 5 investigations of variables related to the motivational control of retrograde amnesia for long-term habits which result from single electroconvulsive shock treatments. Ss were 176 Long Evans rats. In terms of the paradigms of M.L. Robbins and D.R. Meyer (see PA Vol. 44:11964), habits that were 3rd in a series were generally resistant to the treatment and were markedly impaired if the tests for retention were carried out in changed motivational contexts. The latter result is discussed in relation to the view that long-term habits are affected by the treatments if and only if they operate as punishments. (*)(15 ref.) *Journal abstract*

1. Record number
2. Author(s) (editor(s)) As many as four are listed; if there are more than four, the first is listed followed by et al.

3. Succession of works (I, II, III, etc) are indicated
4. Affiliation of named author/editor only
5. Article title (including subtitles if the original title is in a foreign language, the translation is given in brackets and the original title of the original article is indicated in parentheses)
6. Primary journal title and bibliographic information
7. Text of abstract
8. Referencing to a previous entry in *Psychological Abstracts* If an abstract number is indicated at time of publication, the number is given. Consult the *Psychological Abstracts* issue noted for more information on the record number system.
9. Subject codes refer to the primary publication and to abstracts and annotations in the *Psychological Abstracts*
10. Abstract

Book Annotation

8328 ²Chase, William G. (Ed.) ¹40 (George Mello U.) ¹Visual information processing. (New York, N.Y.: Academic Press, 1973) 300 pp. \$12.50. ⁶Considers some of the ways in which perception is represented and interpreted in terms of experimental and theoretical procedures.

1. Record number
2. Author(s) and editor(s) As many as four are listed; if there are more than four, the first is listed followed by et al.
3. Title of book (editor)

4. Affiliation of named author/editor only
5. Book title (including subtitles if the original title is in a foreign language, the translation is given in brackets and the original title of the original article is indicated in parentheses)
6. Primary journal title and bibliographic information
7. Text of abstract
8. Referencing to a previous entry in *Psychological Abstracts* If an abstract number is indicated at time of publication, the number is given. Consult the *Psychological Abstracts* issue noted for more information on the record number system.

9. Subject codes refer to the primary publication and to abstracts and annotations in the *Psychological Abstracts*
10. Abstract

An average of five index terms is drawn from the **Thesaurus of Psychological Index Terms** and applied to each PsycINFO record. These terms are used in search and retrieval, comprise the **Brief Subject Index** for the monthly **Psychological Abstracts** journal, and are cumulated for the **PA Volume Indexes**.

All records are encoded on machine readable tapes to provide the following PsycINFO services.

The records in each monthly issue of the **PA** journal are arranged in alphabetical order by author within the broad content classification categories. These records are numbered consecutively within each six-issue volume.

Each issue contains a **Brief Subject Index** and an **Author Index**. In the **Brief Subject Index**, index terms with appropriate cross-references are listed in alphabetical order, followed by the identifying numbers of those records describing content represented by the term. The **Author Index** is intended to be a name index only, not a person index. Thus, "Smith, J." is listed separately from "Smith, John," even though both terms refer to the same person; similarly, numbers of all records ascribed to "Smith, J." would be listed jointly, although they may identify the work of different authors. Up to four authors are referenced for each record.

The **Volume Index** provides an expanded subject index and an integrated author index for each six-issue volume of the **PA** journal. This **Volume Index** appears semi-annually after six issues have been completed. Entries in the subject index portion are in the form of free index phrases alphabetically arranged under the appropriate index terms and followed by an identifying record number. Index phrases identify the independent and dependent variables described in the material and the subject population. In addition, each **Volume Index** contains a complete list of all periodicals regularly scanned for **PA** coverage.

Psychological Abstracts (PA)

PA is published monthly in two volumes (January through June, and July through December). The cost is \$20 for 12 issues to individuals with non-institutional addresses; \$35 with **Volume Indexes**. \$220 (foreign \$230) to institutions—this price includes all PA issues and **Volume Indexes**.

MAJOR CLASSIFICATION CATEGORIES

The content of the 16 major classification categories of PA is described below. In addition, most of the major classifications also contain an array of subsections. All abstracts that are relevant to a topic narrower than the major categories are grouped under a single heading in each subsection. Abstracts that are relevant to a major category but not to any of the subsections are listed first and are followed by abstracts that are relevant both to a major category and also to the subsections. This helps readers locate material related to their interests more quickly. The 16 categories are as follows:

General Psychology

General Psychology. This category encompasses information with a global scope of the field of psychology. It includes the history and philosophy of psychology, contributions of major importance to the field, and general theories of behavior. Subcategories of general psychology within this classification include documents which discuss research methodology, experimental design, and apparatus used in psychological experimentation. Experimental techniques such as computer simulations of general behavioral processes are included. An additional major subcategory is parapsychology, which includes studies of extrasensory perception, psychokinesis, precognition, telepathy, clairvoyance, and other parapsychological phenomena.

Psychometrics

Psychometrics. This category includes psychometric methodology encompassing all types of measurement used in psychological evaluation regardless of setting. It is used for description of the construction, validation, or statistical evaluation of tests, attitude inventories, or rating scales. Material on reliability, standardization of norms, validation of new sample populations or foreign language versions of tests is classified in this area. This category also includes material concerning mathematics and statistics, mathematical models, and statistical formulas used in psychological evaluation.

Experimental Psychology (Human)

Experimental Psychology (Human). This category involves the study of human behavior in an experimental setting. This would include studies of all human perceptual processes (visual, auditory, kinesthetic, chemical senses, somesthetic) as well as studies of perceptual judgment or discrimination, time perception, reaction time, motor performance, and signal detection. Audiometric studies relating to perception rather than to physiology are classified here. Included in this area are studies of the cognitive processes of learning, memory, decision making, problem solving, thinking, reasoning, attention, imagination, inference and ideation, when examined in a noneducational or nondevelopmental context. It includes studies of how motivation and emotion affect mental processes. An additional subcategory of consciousness states involves the study of sleep, dreaming, and vigilance as well as how techniques such as hypnosis and meditation alter states of consciousness.

Experimental Psychology (Animal)

Experimental Psychology (Animal) This category includes all studies of animal behavior, both in natural and experimental settings. This involves the application of conditioning techniques and altered environmental states to study animal learning, motivation and emotion, social and sexual behavior, instinctive behavior, early experience, development, and sensory processes. Studies of animal physiology and intervention of physiological processes to study animal behavior are not classified under this heading.

Physiological Psychology

Physiological Psychology. This category is concerned with the study or measurement of the neurological and physiological structures, systems, and processes of humans and animals, and their genetic determinants. It involves environmental and external effects (including stress, parameters of conditioning, biofeedback, sleep

and their development. This category includes the study of the development of language, thought, and behavior. This category includes the study of the development of the individual and the social environment. This category includes the study of the development of the individual and the social environment. This category includes the study of the development of the individual and the social environment.

Physiological Intervention This category involves the study of the physiological basis of behavior. This category includes the study of the physiological basis of behavior. This category includes the study of the physiological basis of behavior. This category includes the study of the physiological basis of behavior. This category includes the study of the physiological basis of behavior.

Physiological Intervention

Communication Systems This category is concerned with the study of communication systems. This category includes the study of communication systems. This category includes the study of communication systems. This category includes the study of communication systems. This category includes the study of communication systems. This category includes the study of communication systems.

Communication Systems

Developmental Psychology This category concerns all stages of human development with reference to the processes of cognitive, perceptual, physical, motor, personality, emotional speech language intellectual and social development in a noneducational setting.

Developmental Psychology

Social Processes and Social Issues This category examines social phenomena in a natural setting from a psychological perspective. This category includes the study of ethnic groups, social groups, cultures, subcultures, and regions of various countries and the dynamics of each as they relate to one another or the larger social system. It includes governments, as well as the law, politics, economics, international relations, and social structures of nations and societies. Within societies, social movements and issues of social concern are considered, such as drug and alcohol use, sex roles, societal mores, psychosexual behavior, race, integration, war, busing, childrearing practices, abortion, birth control, family planning, euthanasia, social policy, social control, and the impact of social institutions on the members of a society. Dynamics of marriage and family relations are included in this area.

Social Processes and Social Issues

Experimental Social Psychology This category involves the study of social behavior in an experimental setting. This category focuses on the dynamics and processes involved in human interpersonal relations. Interpersonal relations may involve two or more people, small or large groups, but does not include relations between societies or countries. Studies of verbal or nonverbal communication dynamics within groups, social perception and the behavior motivated by the perception, strategies involved in bargaining and game playing, or attitude formation and change resulting from interpersonal influences are classified in this area.

Experimental Social Psychology

Personality This category involves the study of human personality traits and processes and their behavioral manifestations. This includes emotions and emotional reactions, defense mechanisms, cognitive style, self concept, self perception, intelligence, creativity, and the measurement of these traits. Applications of personality theory to the psychological analysis of historical and political figures are classified here.

Personality

Physical and Psychological Disorders This category encompasses mental and physical disorders as they are studied outside of a treatment context. Mental disorders include affective and emotional disturbances, hysteria, mania, neurosis, personality disorders, phobia and psychosis. Behavior disorders include criminal conduct, juvenile delinquency, sadomasochism, alcoholism, child abuse, and antisocial behavior. Physical disorders include cardiovascular, congenital, digestive system, endocrine, genetic, immunologic, metabolic, musculoskeletal, neonatal, nervous

Physical and Psychological Disorders

system, respiratory tract, sense organ, skin, toxic, and urogenital disorders, neoplasms, and perceptual disturbances. Learning and speech disorders, psychosomatic disorders, and mental retardation are also classified in this area.

Treatment and Prevention

Treatment and Prevention. This category includes material focusing on modes of treatment intervention or discussion of treatment methods applied to clinical populations and the prevention of physical and mental disorders. It includes all psychotherapeutic methods and procedures as well as psychodiagnosis and studies of the therapeutic process. Types of psychotherapy include group therapy, psychoanalysis, behavior and conditioning therapies, family therapy, encounter group therapy, art and music therapy, hypnotherapy, milieu therapy, analytic psychotherapy, and creative therapy. Studies concerning uses, methods, or research in psychotherapeutic counseling, or the therapeutic process in the counseling relationship are classified in this area, with the exception of those studies dealing with educational or vocational counseling. Counseling of nonclinical populations includes family, marital, behavioral, group, pastoral, and marathon group counseling and social casework. Adjunctive psychotherapy techniques such as electroconvulsive shock and electrosleep therapies are also included in this category. The treatment category also covers the use of any treatment techniques other than psychotherapy or counseling with any clinical populations. This includes drug therapy, speech therapy, surgical techniques and medical treatment methods, occupational and physical therapy, drug rehabilitation, vocational rehabilitation, and psychiatric hospital, institutional, hospital patient and outpatient services, as well as community services such as crisis intervention, halfway houses, mental health clinics, community mental health programs, diagnostic clinics, and medical outpatient services.

Professional Personnel and Professional Issues

Professional Personnel and Professional Issues. This category focuses on the interests, characteristics, education and training of psychological and medical personnel, such as physicians, nurses, psychologists, therapists, counselors, social workers, psychiatrists, mental health professionals, hospital personnel, residential care institution personnel and related paraprofessionals. This category includes the licensing and ethical standards of the aforementioned groups. Discussions of interdisciplinary cooperation, the utilization of professional personnel, their attitudes and personalities, and career opportunities are classified in this area. Symposia, meetings, and conferences as related to professional developments both domestically and abroad are included.

Educational Psychology

Educational Psychology. This category is restricted to material in which the educational setting is relevant. Basic areas include school adjustment and classroom behavior, academic achievement, school learning and prediction of achievement, training, functions, attitudes, personality and organization of educational personnel and school administration, educational test administration and performance influenced by test characteristics, curriculum development and educational programs and teaching methods and aids, special and remedial education for all types of handicapped, deficient, and learning disabled students, and educational and vocational guidance services in a school setting. Studies involving students of all ages (i.e., preschoolers through graduate students and students in adult educational programs) are classified in this area.

Applied Psychology

Applied Psychology. This category includes those studies in which the occupational setting is relevant, as well as studies on driving and safety, and consumer behavior as it applies to marketing and advertising. Basic areas include vocational guidance in the work environment, occupational attitudes, interests, personnel selection and training, job performance and satisfaction, employee attitudes and occupational aspirations, work task analysis, industrial safety and accident prevention, engineering psychology (i.e., man-machine systems, visual search of displays and targets, aircraft design and controls, manual controls, aircraft instrumentation, and other controls and displays), organizational structure and climate, management

low enforcement pat

Cumulative Indexes

The **Author Index** contains references to authors who produced material that was summarized in 36 issues of **Psychological Abstracts**. As many as four authors are referenced for each entry. Thus, all the publications of individual investigators who conduct programmatic research in collaboration with others can be easily identified. Primary entries in the index contain up to four authors' names, title of article, and indication if the title has been translated from a foreign language, title of source document, year of publication, volume and issue numbers, inclusive pagination, and **PA** volume and record numbers. Secondary authors are listed by name only, with a cross-reference to the primary author and **PA** volume and record number (one volume).

	U.S. and other PLAS countries	Non-PLAS countries
Cumulative Subject Index to Psychological Abstracts, 1972-74 (two volumes).	\$380	\$390
Cumulative Author Index to Psychological Abstracts, 1972-74 (one volume).	\$235	\$245
Discount available by purchasing both indexes for 1972-74	\$485	\$495

PRICES FOR PREVIOUS EDITIONS OF CUMULATIVE INDEXES

The **Cumulative Subject Index to Psychological Abstracts, 1969-71** (two volumes) costs \$360 to residents of U.S. and other PUAS countries, \$390 to residents of non-PUAS countries.

The **Cumulative Author Index to Psychological Abstracts 1969-71** (one volume) costs \$220 to residents of U.S. and other PUAS countries, \$240 to residents of non-PUAS countries.

Discount prices are available by purchasing both indexes for 1969-71. The cost is \$465 to residents of U.S. and other PUAS countries; \$495 to residents of non-PUAS countries.

Earlier editions of the **Cumulative Indexes to Psychological Abstracts**, for the period 1927-68, may be obtained by writing to G. K. Hall & Company, 70 Lincoln Street, Boston, Massachusetts 02111. Do not write to APA to obtain information about these editions.

ORDERING INFORMATION

Also see page 15 for an order form.

Please send your request for the 1969-71 and 1972-74 editions accompanied by full payment or institutional purchase order to Publications Sales Department, APA, 1200 17th Street, N.W., Washington, D.C. 20036.

Thesaurus

The **Thesaurus of Psychological Index Terms** contains approximately 4,000 terms representing an unambiguous and hierarchically structured vocabulary used by psychology and related disciplines. This vocabulary will facilitate precise and structured content representation of psychological literature and allow for more flexibility in automated search and retrieval operations.

To assist the thesaurus user in selecting appropriate terms for different uses, the vocabulary has been displayed in three sections: the relationship section, the alphabetic section, and the hierarchical section. Each section is briefly described below, followed by an example.

Each thesaurus term shows the relationship of other terms conceptually associated with it. The major relationships noted are: synonymous, broader, narrower, and related. For example:

RELATIONSHIP SECTION

HIERARCHICAL SECTION

The Thesaurus contains 32 pages of terms and definitions. It is available to all orders. Incentives for those orders submitting a minimum of 100 abstracts are provided. Publications Sales Department, APA, 1200 17th Street, N.W., Washington, D.C. 20036.

ORDERING INFORMATION

Also see page 15 for an order form.

Psychological Abstracts Direct Access Terminal. The PsycINFO project is available through several national and international distribution networks. Institutions may lease terminals from a variety of providers with a minimum commitment of 12 months. Terminal speed (10 cps, 15 cps, 30 cps, 120 cps, or 480 cps) and other specifications. The cost of interacting with PA records varies with the type of terminal and the number of 15 minutes. Other data bases are available, including the Educational Resources Information Clearinghouse (ERIC), the National Technical Information Service (NTIS), and the Social Science Citation Index (SSCI). On-line print costs are 10¢ per record. For more information, contact:

- Manager of PsycINFO
American Psychological Association
1200 17th Street, N.W.
Washington, D.C. 20036
(202) 833-7624

PADAT

Psychological Abstracts Tape Edition Lease or License. Institutions may obtain PsycINFO tapes on a lease or license basis from APA. An institution may lease the tapes if it intends to serve only its members. If an institution wishes to provide services beyond its members, it must obtain the tapes on an individually negotiated license basis. For more information and current prices, contact:

- Manager of PsycINFO
American Psychological Association
1200 17th Street, N.W.
Washington, D.C. 20036
(202) 833-7624

PASAR

SAMPLE OF A PASAR SEARCH

Psychological Abstracts Search and Retrieval. PASAR is an innovative service designed to benefit the individual users of psychology-related information. It provides a comprehensive literature search capability at a level of complexity achievable only through automated retrieval techniques. The intellectual burden for conducting an effective search is shared by the requester and APA information specialists who formulate specific retrieval strategies, augmenting vocabulary and other search parameters supplied by the requester. Experience has provided APA information specialists with the skills to efficiently interact with the automated PsycINFO data base which contains records published in **Psychological Abstracts** from 1967 through the present.

Charges for processing **PASAR** requests are based on the amount of computer time required to perform a search. Typically these charges range from \$40 to \$60 and will not exceed \$100 unless the requester is contacted first. The total charge for a search is based on its complexity and is in most cases unrelated to the number of references retrieved. For example, a complex search strategy involving many variables or limiting factors may require more computer time and may result in fewer references retrieved than a broad search with few limiting factors.

DOC YEAR: 1973 VOL NO: 50 ABSTRACT NO: 03623

AUTHOR:
Stone, Sarihenne; Coughlan, Philippa M.

TITLE:
Four process variables in counselors with mentally retarded clients.

SOURCE DOCUMENT TITLE:
American Journal of Mental Deficiency

SOURCE DOCUMENT YEAR AND CITATION:
1973 Jan Vol. 77(4) 406-414

ABSTRACT:
Constructed rating scales to define and measure self and counselor and client behaviors that occur across a school year of counseling. The scales were used in an exploratory investigation of the interactive changes in the verbal behavior of 3 counselors and 3 institutionalized mentally retarded 11-16 yr. old clients in early (8th) and later (9th) counseling interviews. It was found that in later interviews, client and counselor focused on general rather than problem behavior, counselor self-extension increased, and client affective behavior decreased. Deviations of 3 counselor and 3 clients from that pattern are discussed. It is concluded that further research employing this approach appears warranted.

ORDERING INFORMATION

Also see pages 11 and 13
for search request forms.

When ordering a **PASAR** search, please read the guidelines on the reverse side of the request form before completing the form. A purchase order must accompany all institutional requests for a **PASAR** search. For individuals requesting a **PASAR** search, the signature of the person responsible for payment must appear on the request form. Send your request to **PASAR**, APA, 1200 17th Street, N.W., Washington, D.C. 20036.

P P P P P PASAR

is an innovative service designed to benefit the individual users of psychology-related information. It provides a comprehensive literature search capability at a level of complexity achievable only through automated retrieval techniques. The intellectual burden for conducting an effective search is shared by the requester and APA information specialists who formulate specific retrieval strategies, augmenting vocabulary and other search parameters supplied by the requester. Experience has provided APA information specialists with the skills to efficiently interact with the automated data base which contains records published in PSYCHOLOGICAL ABSTRACTS from 1967 through the present.

Charges for processing PASAR requests are based on the amount of computer time required to perform a search. Typically these charges range from \$40 to \$60 and will not exceed \$100 unless the requester is contacted first. The total charge for a search is based on its complexity and is in most cases unrelated to the number of references retrieved. For example, a complex search strategy involving many variables or limiting factors may require more computer time and may result in fewer references retrieved than a broad search with few limiting factors.

PASAR Search Request Guidelines

The PASAR Request Form has been designed to assist you in constructing a comprehensive statement of your requirements. However, it should not restrict your input. Provide whatever other information you feel will augment the information specialist's understanding of your requirements. These guidelines should help to clarify items on the Request Form.

ITEM 1. Narrative statement of search topic. Provide a detailed description of the subject matter you wish to be retrieved. Please avoid submitting multiple, discrete requests on a single PASAR Request Form, since such cannot be processed for a single fee. However, multiple aspects of a primary subject may be requested. The distinction is illustrated in the following examples:

Acceptable: "the effects of socioeconomic status, education level, or birth order on career motivation in women."

"Career motivation" is the primary element of this request, while the other elements serve merely to qualify or narrow the scope of this rather broad subject area.

Unacceptable: "the measurement of employee attitudes concerning wages and benefits. Also desire references dealing with the factors that influence management decision-making with respect to personnel policies and procedures."

Although these two topics are closely related to the design and administration of personnel policies and procedures, two separate search strategies would have to be executed to retrieve the specific information requested, and a separate charge for each would have to be made.

ITEM 2. Descriptor(s) relevant to dependent variable(s). Provide a list of words or phrases that indicate the subject matter of prime interest. Descriptors for the "acceptable" example (see Item #1) might include: career motivation, career preference, and career aspirations.

ITEM 3. Descriptor(s) relevant to independent variable(s). Provide a list of words or phrases that will qualify or narrow the scope of the dependent variable. Descriptors for the "acceptable" example (see Item #1) might include: socioeconomic status, social class, educational level, birth order, and women.

ITEM 4. Search qualifications. Once the subject matter of the search has been defined, you may wish to refine it with specific requirements such as population or time frame. These qualifications are often essential to the actual information need; however, they can unnecessarily limit the search, causing retrieval of few of the relevant records. Therefore, consider your requirements carefully.

ITEM 5. Sorting requirements. Please indicate whether you would prefer to have references sorted alphabetically by author or chronologically by year.

ITEM 6. Intended use of search results. Provide a description of how the references resulting from your search will be used (e.g., definition of a research project, preparation of an article, proposal preparation, dissertation, etc.).

Ordering information: When ordering a PASAR search, please read the above guidelines carefully before completing the request form. A purchase order must accompany all institutional requests for a PASAR search. For individuals requesting a PASAR search, the signature of the person responsible for payment must appear on the PASAR request form.

PASAR Search Request Guidelines

PASAR

Constructing a comprehensive statement of your requirements is the key to a successful search. The following guidelines are intended to help you formulate a clear and concise statement of your requirements. These guidelines should be followed in the Request Form.

ITEM 1. Narrative statement of search topic. Provide a description of the subject matter you wish to be retrieved. Please avoid the use of the term "PASAR" in the Request Form, since such cannot be processed for a single fee. However, multiple aspects of a primary subject may be requested. The distinction is illustrated in the following examples:

Acceptable: "the effects of socioeconomic status, education level, or birth order on career motivation in women."

"Career motivation" is the primary element of this request, while the other elements serve merely to qualify or narrow the scope of this rather broad subject area.

Unacceptable: "the measurement of employee attitudes concerning wages and benefits. Also desire references dealing with the factors that influence management decision-making with respect to personnel policies and procedures."

Although these two topics are closely related to the design and administration of personnel policies and procedures, two separate search strategies would have to be executed to retrieve the specific information requested, and a separate charge for each would have to be made.

ITEM 2. Descriptor(s) relevant to dependent variable(s). This is a list of words or phrases that indicate the subject matter of primary interest. Descriptors for the "acceptable" example (see Item #1) might include: career motivation, career preference, and career aspirations.

ITEM 3. Descriptor(s) relevant to independent variable(s). Provide a list of words or phrases that will qualify or narrow the scope of the dependent variable. Descriptors for the "acceptable" example (see Item #1) might include: socioeconomic status, social class, educational level, birth order, and women.

ITEM 4. Search qualifications. Once the subject matter of the search has been defined, you may wish to refine it with specific requirements such as population or time frame. These qualifications are often essential to the actual information need; however, they can unnecessarily limit the search, causing retrieval of few of the relevant records. Therefore, consider your requirements carefully.

ITEM 5. Sorting requirements. Please indicate whether you would prefer to have references sorted alphabetically by author or chronologically by year.

ITEM 6. Intended use of search results. Provide a description of how the references resulting from your search will be used (e.g., definition of a research project, preparation of an article, proposal preparation, dissertation, etc.).

Ordering information: When ordering a **PASAR** search, please read the above guidelines carefully before completing the request form. A purchase order must accompany all institutional requests for a **PASAR** search. For individuals requesting a **PASAR** search, the signature of the person responsible for payment must appear on the **PASAR** request form.

PSYCHOLOGICAL ABSTRACTS 1976 CHANGES

Content Classification. As the result of an extensive study of the psychological literature, a new classification system for 1976 has been developed which groups the literature in a manner more useful to the reader. This classification outline, showing major and minor subject areas, has become the new Table of Contents. The January 1976 issue of *PA* describes these new classifications and their contents in the *Guide to PsycINFO*.

Dissertation Abstracts International. In 1976, *PA* will resume coverage of *Dissertation Abstracts International (DAI)*. Since coverage was suspended in mid 1973, there will be a period of catching up to insure that all material will be included in the 1975-1977 Cumulative Index and that no gaps will appear in the retrospective data base. The relevant dissertations for the last half of 1973, all of 1974 and 75 will be cited in the 1976 issues of *PA*. In 1977, all relevant dissertations from 1976 and 77 will be covered. The 1978 issues will include *DAI* as one of the regularly scanned journals on a current basis.

GUIDE TO PsycINFO

The *Guide* describes innovations in *Psychological Abstracts (PA)* as well as derivative products and services designed to facilitate selective access to the world's scientific literature in psychology and related disciplines. Copies of the *Guide* are available upon request from:

PsycINFO
American Psychological Association
1200 17th Street, N.W.
Washington, D.C. 20036

Psychological Abstracts (PA) provides nonevaluative summaries of the world's literature in psychology and related disciplines. Over 850 journals, technical reports, monographs and other scientific documents provide material for coverage in *PA*. About 20% of the records published in *PA* are bibliographic citations or annotations which are used to cover books, articles peripherally relevant to psychology, or articles that can be represented adequately in approximately 30-50 words.

Issue. The monthly issues contain abstracts listed under 16 major classification categories, with some categories having subsections, as shown in the Table of Contents. Under each classification heading, the abstracts are arranged alphabetically by first author. Abstracts are numbered consecutively in the two volumes produced each year.

Indexes. An author and brief subject index appear in the issues. An expanded and integrated Volume Index is published every six months. Three-year cumulative indexes are also available.

PsycINFO. *PA* records published since 1967 are now on machine readable tapes which provide the basis for automated search and retrieval services known as *Psychological Abstracts Information Services (PsycINFO)*. For more information on these products, uses and costs, write to PsycINFO, American Psychological Association, 1200 Seventeenth St., N.W., Washington D.C. 20036.

Correspondence on copyright matters should be directed to the permissions office, on back issue sales to the order department, and on subscriptions and address changes to Anne Rodman, Subscription Manager. All correspondence should be addressed to the American Psychological Association, 1200 Seventeenth St., N.W., Washington, D.C. 20036.

Address changes must reach the Subscription Office, APA, 30 days prior to the actual change of address. Copies undelivered because of address change will not be replaced; subscribers should notify the post office that they will guarantee second class forwarding postage. Other claims for undelivered copies must be made within 4 months of publication. Address your claims to Subscription Manager, APA.

Subscriptions are available on a calendar-year basis only, beginning through December. Published monthly in two volumes (January through June, and July through December), each volume contains approximately 15,000 abstracts. Single volume orders are processed twice a year with separate order forms for each price including postage per year of \$35.00 domestic, \$40.00 foreign. To subscribe, write to Subscription Manager, APA.

JOURNAL ARTICLE ABSTRACT

1771. Canger, Anthony L. & Cole, John D. (Duke U) "Who's crazy in Manhattan: A reexamination of "Treatment of psychological disorders among urban children." *Journal of Consulting & Clinical Psychology*, 1974(Apr), Vol 4(2), 179-182. *Renalyzed data reported by T. S. Laanger et al (see PA Vol 52(150) on the prevalence of psychological disturbances in children from welfare and cross-section homes. Results indicate that the data show no meaningful differences in means or skew and a paradoxical greater heterogeneity among welfare children. Some of the difference in variance is clearly attributable to the differential reliability of final scores, and perhaps the remaining difference is due to between-rater differences. Unless other factors were operating, 2 possible conclusions are tenable: Either welfare children manifest both more health and more disturbance than cross-section children or there are no differences in disorder between the populations. A 3rd conclusion is also offered: The populations do actually differ, but the manner in which the disturbance was viewed, rated, and compared necessarily obscured any differences. *15 ref.)—*Journal Abstract*.

- 1—Record number
- 2—Author(s) or editor(s). As many as four are listed; if there are more than four, the first is listed followed by "et al." Succession marks (i.e., Jr., II, III, etc) are not given.
- 3—Affiliation of first-named author/editor only.
- 4—Article title, including subtitles: If the original article is in a foreign language, the translated title is given in brackets and the language of the original article is indicated in parentheses.
- 5—Primary publication title and bibliographic data.
- 6—Text of abstract.
- 7—Reference to a previous entry in *Psychological Abstracts*. If an abstract number is unavailable at time of publication, the issue number is given. Consult the Author Index of the PA issue noted in order to determine the record number for the article.
- 8—Summaries included in the primary publication are listed when in language(s) other than that of the article.
- 9—Number of references is included when there are 15 or more listed.
- 10—Abstract source.

BOOK CITATION

1703. Sugar, Max (Ed). (Louisiana State U, Medical School, New Orleans) "The adolescent in group and family therapy." New York, NY: Brunner/Mazel, 1975. *xvii, 286 p. \$13.50.

- 1—Record number.
- 2—Author(s) or editor(s). As many as four are listed; if there are more than four, the first is listed followed by "et al." Succession marks (i.e., Jr., II, III, etc) are not given.
- 3—Designation of editor.
- 4—Affiliation of first-named author/editor only.
- 5—Book title: If the book is in a foreign language, the original title is given followed by a translated title and the language of the book is indicated in parentheses.
- 6—Place of publication.
- 7—Publisher.
- 8—Year of publication.
- 9—Prepagination.
- 10—Total pagination.
- 11—Price.
- 12—Annotation occasionally follows.

BOOK CHAPTER CITATION

1641. Berkovitz, Irving H. & Sugar, Max. (U California, Los Angeles) "Indications and contraindications for adolescent group psychotherapy." In M. Sugar (Ed), *The adolescent in group and family therapy*. New York, NY: Brunner/Mazel, 1975. xvii, 286 p. \$13.50.

- 1—Record number.
- 2—Author(s) of cited chapter. As many as four are listed; if there are more than four, the first is listed followed by "et al." Succession marks (i.e., Jr., II, III, etc) are not given.
- 3—Affiliation of first-named author only.
- 4—Chapter title.
- 5—Referral to the whole book and its bibliographic data.

CONTENT CLASSIFICATION: PA has subsections for some of the 17 major classification categories. These are displayed in the Table of Contents and are designed to group all abstracts relevant to a narrower topic than the major categories under a single heading. Abstracts that are relevant to a major category but not to any of the subsections are listed first and followed by abstracts that are relevant both to a major category and also to the subsections. It is expected that this will help readers locate material related to their interests more quickly.

ABBREVIATIONS: In addition to commonly understood abbreviations* (including all units of measurement, educational degrees, standard statistical abbreviations, and standard Latin and reference terms), standard abbreviations used in *Psychological Abstracts* records are

CA	= chronological age
CNS	= central nervous system
CR	= conditioned response
CS	= conditioned stimulus
DRL	= differential reinforcement of low rates (of responding)
E	= experimenter
ECS	= electroconvulsive shock
EKG	= electrocardiogram (graph)
EMG	= electromyogram (graph)
EPPS	= Edwards Personal Preference Schedule
Exp	= experiment
FI	= fixed interval (reinforcement)
FR	= fixed ratio (reinforcement)
GPA	= grade point average
GSR	= galvanic skin response
ip	= intraperitoneal (ly) (injections)
iv	= intravenous (ly) (injections)
MA	= mental age
MAO	= monoamine oxidase
MMPI	= Minnesota Multiphasic Personality Inventory
NREM	= nonrapid eye movement
REM	= rapid eye movement
ROTC	= Reserve Officer's Training Corps
RT	= reaction time
S	= subject
SVIB	= Strong Vocational Interest Blank
TAT	= Thematic Apperception Test
UCR	= unconditioned response
UCS	= unconditioned stimulus
US	= United States of America
USSR	= Union of Soviet Socialist Republics
VI	= variable interval (reinforcement)
VR	= variable ratio (reinforcement)
WAIS	= Wechsler Adult Intelligence Scale
WISC	= Wechsler Intelligence Scale for Children
16 PF	= Sixteen Personality Factor Questionnaire

Computer languages and computer names will also be used without definition, e.g., ALGOL, COBOL, FORTRAN, IBM 360.

Language abbreviations used after translated titles are:

Afri	= Afrikaans	Iren	= Iranian
Alba	= Albanian	Ital	= Italian
Arab	= Arabic	Japn	= Japanese
Bulg	= Bulgarian	Lith	= Lithuanian
Chin	= Chinese	Norg	= Norwegian
Czec	= Czech	Poli	= Polish
Danh	= Danish	Port	= Portuguese
Duth	= Dutch	Romn	= Romanian

PSYCHOLOGICAL ABSTRACTS

Volume 55

February 1976

Number 2

GENERAL PSYCHOLOGY

1710. Bloch, Harry. (State U New York, Downstate Medical Ctr, Brooklyn) **Women's role in medicine in early colonial times.** *New York State Journal of Medicine*, 1975(Apr), Vol 75(5), 770-772.—Summarizes historical documents dealing with the role of women in medicine in the early colonies. Female illiteracy was common. In health care, however, women achieved status. Women collected and exchanged recipes for cures and treatments, grew and processed herbs, engaged in therapies and surgery, and nursed the ill. Obstetrics was, until the 18th century, an exclusively female practice.—P. R. Sweet.

1711. Crapanzano, Vincent. (Queens Coll, City U New York) **Saints, jnun, and dreams: An essay in Moroccan ethnopsychology.** *Psychiatry*, 1975(Mar), Vol 40(3), 145-159.—Uses dream and life history material from Moroccan Arabs to illustrate the consequences of the particular idiom they use to express psychological experiences. This idiom is employed to structure and evaluate reality and to express both the experience of reality and subjective experiences. The ways saints and demons are manifested in dreams are examined, and the relations between visitational dreams and conflict resolution are noted. The use of idiom to move conflict from the particularistic to the universal level is also examined. (24 ref)—R. Tomasko.

1712. Dale, Alan. (London Business School, England) **Coercive persuasion and the role of the change agent.** *Interpersonal Development*, 1974-1975, Vol 8(2), 102-111.—Uses literary methods and sources to examine dilemmas faced by applied behavioral scientists and other change agents. Many change agents appear to operate as pawns, both of the old cultures which they try to change and of the new cultures which they partly embrace. Some show signs of an inability to cope with reality, particularly the reality of power and responsibility. It is argued that, to escape from the status of pawn and remain mentally healthy, a person must take a position and refuse to be merely an agent for somebody else. In turn, those who seek to bring about changes should try to develop similar capacities in others, ultimately as a defense against authoritarian and totalitarian regimes.—*Journal abstract.*

1713. Moore, Michael. (Israel Inst of Technology, Haifa) **Some antecedents of scientific productivity.** *Journal of Behavioural Science*, 1974, Vol 2(2), 33-37.—Uses path analysis to identify some antecedents of the scientific productivity shown by 72 selected countries of the world, as well as by the 50 United States. It is found that an asymmetrical, causal model based on linear regression is highly efficient in predicting the number of

papers published by a country (or state). Prediction in both cases is based on gross national product (or its state equivalent) and on population. Other variables (science and calory intake, as well as infant mortality rate for the selected countries; illiteracy rate, estimated school expenditure, and infant mortality rate for the U.S.) show no direct influence over scientific productivity as here defined. (15 ref)—*Journal abstract.*

1714. Tang, Terry. (Chinese U Hong Kong) **A preface to experimental psychology in China.** *Psychologia: An International Journal of Experimental Psychology*, 1975(Mar), Vol 18(1), 30-34.—Notes that, except for conflicting interview reports as to whether or not psychology had been known outside the Peoples' Republic of China (PRC) about contemporary psychology in China. Recently, however, psychology has been known to exist in the PRC. The preface to the Chinese edition of R. W. Woodworth and H. S. Woodworth's *Experimental Psychology*. The preface to the Chinese edition of *Experimental Psychology* is translated and presented here, because it is regarded as denotative information on the nature of experimental psychology in China. This preface provides a delineation of the theoretical position of PRC psychology. Its contents and wide circulation within China suggest that psychology is both a science and a viable institution in that nation.—*Journal abstract.*

Parapsychology

1715. Brookes-Smith, Colin. **Paranormal electrical conductance phenomena.** *Journal of the Society for Psychical Research*, 1975(Jun), Vol 48(764), 73-86.—Reports results obtained at 19 sittings between January and August, 1973, which attempted to explore the notion that paranormal electrical conductance effects can occur during force displays of psychokinesis. Electrical effects reported developed from chance observations of signals unaccountably appearing on pen-chart transcriptions of data-tape records. It is concluded that said notion is a reasonable inference from the data. Descriptions of electrical recording material are provided, and a discussion of problems facing future experimentation.—G. J. Frankel.

1716. Honorton, Charles. (Maimonides Medical Ctr, Brooklyn, NY) **Psi and mental imagery: Keeping score on the Betts Scale.** *Journal of the American Society for Psychical Research*, 1975(Oct), Vol 69(4), 327-332.—Reviews 6 experimental studies relating ESP scores to individual differences in vividness of mental imagery as defined by the short form of the Betts Questionnaire upon Mental Imagery—the Vividness of Imagery Scale.

3 of these studies, involving forced-choice (guessing) ESP tasks, produced significant scoring differences between Betts-defined vivid and weak imagers, with superior performance by weak imagers in 2 of the 3 studies. No significant Betts-Psi relations were found in 3 free-response (imagery-mediated) Psi studies when controlled against artifacts associated with pre-Betts feedback of ESP scores. Other research with the Betts indicates that it lacks sufficient construct validity to warrant confidence as a measure of individual differences in mental imagery. It is concluded that a better measure of imagery is needed and that a converging operations approach, involving a combination of subjective, behavioral, and psychophysiological measures, may provide the most satisfactory resolution to the problem of measuring mental imagery.—*Journal abstract.*

1717. **Honorton, Charles.** (Maimonides Medical Ctr, Brooklyn, NY) **Objective determination of information rate in psi tasks with pictorial stimuli.** *Journal of the American Society for Psychical Research*, 1975(Oct), Vol 69(4), 353-359.—Presents a new method for evaluating free-response ESP data. The method provides an objective basis for assessing the information rate in Psi tests in terms of the information content of the target, the S's report, and the degree of correspondence between them. The method is based on the development of a special series of 1,024 target pictures, each of which represents a unique combination of elements from 10 content categories, such that each target trial constitutes 10 independent binary trials.—*Journal abstract.*

1718. **Maher, Michaelen & Schneider, Gertrude R.** (City U New York) **Quantitative investigation of a recurrent apparition.** *Journal of the American Society for Psychical Research*, 1975(Oct), Vol 69(4), 341-351.—Presents the case of a young woman who reported seeing a person in the hallway of the apartment where she lived with her mother, but subsequent search showed no one there. On the following evening, her mother reported a somewhat similar experience. To investigate the hypothesis that the apartment was "haunted," a floor plan of it was sectioned into comparable units, and a checklist was constructed of items both consistent and inconsistent with the witnesses' reports. 4 sensitives and 8 skeptics toured the apartment individually. Sensitives recorded impressions of where a ghost was, and skeptics reported where one might be "seen" by the credulous. 2 sensitives and 5 skeptics similarly marked the checklist. 2 sensitives' records showed significant correspondence to witnesses' reports ($p < .03$; $p < .04$), but no skeptic's record showed even a marginally significant correspondence. Further reports from the sensitives showed some qualitative resemblance to the witnesses' reports.—*Journal abstract.*

1719. **Palmer, John.** (U California, Davis) **Three models of psi test performance.** *Journal of the American Society for Psychical Research*, 1975(Oct), Vol 69(4), 333-339.—Attempts to clarify and make more explicit various implicit assumptions underlying the interpretation of ESP and psychokinetic test results. To this end, 3 models of Psi test performance are outlined. The first is a 2-factor model which assumes that mean chance expectation is the baseline for purposes of analysis. The second is a 1-factor model and assumes that zero is the

baseline. The third model is a complex 4-factor one in which 2 sets of 2 factors are postulated. Several examples are given for each model, and suggestions are made for conceptualizing more incisively the dependent variable in parapsychological research, the Psi test score.—*R. A. White.*

1720. **Panati, Charles.** **Precognition and time.** *Parapsychology Review*, 1975(Jul-Aug), Vol 6(4), 1-4.—Argues that the nature of time has a direct bearing on understanding precognition. Einstein's theory of relativity is examined with respect to motion, the effect of gravity, and antiparticles in relation to time. Fundamental laws of nature do not give a preferred direction to time so that precognition and retrocognition are not an impossibility. A conception of time as flowing only forward arises because conscious awareness of it depends on successive acts of attention. The individual notes cause, then effect, and feels a flowing; time is also marked on the basis of bodily rhythms. Perhaps this is why subjective time changes when the mind transcends the body.—*P. F. Grim.*

1721. **Price, Leslie.** **Some aspects of British psychical research.** *Parapsychology Review*, 1975(Jul-Aug), Vol 6(4), 25-28.—Surveys the current state of psychical research in Britain.

1722. **Schechter, Richard; Solfin, Gerald & McCollum, Rebecca.** (U California, Los Angeles, CA) **Psi and mental imagery.** *Journal of the American Society for Psychical Research*, 1975(Oct), Vol 69(4), 321-326.—A previous study claiming to implicate vivid mental imagery (as measured by a self-rating scale) in Psi-mediation is criticized for its inability to explain significant Psi-missing in "weak imagers" and the dubious attribution of the significant results obtained to the role of imagery as a mediating factor in the Psi process. An independent replication of the original study was performed. 48 Ss were each tested on 6 clairvoyance runs with standard ESP decks, followed by the administration of Sheehan's shortened version of the Betts Questionnaire upon Mental Imagery—the Vividness of Imagery Scale. Contrary to the previous study, the strong imagers showed a nonsignificant tendency toward Psi-missing, while the weak imagers showed significant Psi-hitting ($p = .002$). The difference between the ESP scores of the strong and weak imagers was also significant ($p = .005$). It is concluded that vivid mental imagery (self-rated) is neither necessary nor sufficient for the operation of Psi and, further, that self-rated weak imagery may prove to be more reliable in predicting the occurrence, if not the directionality, of Psi.—*Journal abstract.*

1723. **Schmidt, Helmut.** (Mind Science Foundation, San Antonio, Tx) **Toward a mathematical theory of psi.** *Journal of the American Society for Psychical Research*, 1975(Oct), Vol 69(4) 301-319.—Presents a mathematical model which permits a logically consistent discussion of a world with Psi. The model postulates the existence of "Psi sources" which act similarly to successful psychokinetic Ss. No attempt is made to reduce the properties of the Psi sources to some more basic Psi mechanism. Rather, these properties are specified by the "Psi axiom" in mathematically simple form, so that the structure of a world with Psi sources can be discussed in detail. The Psi

axiom leads automatically to space and time independence of Psi, and the different forms of Psi, like psychokinesis, precognition, and clairvoyance, appear as logical consequences of the 1 Psi axiom. The present model with its mathematically simple structure has a large number of testable implications and may serve as a useful basis for future theoretical and experimental studies.—*Journal abstract.*

History & Philosophies & Theories

1724. **Barker, John A.** (Southern Illinois U, Edwardsville) **Scriven on the logic of cause.** *Theory & Decision*, 1975(Feb), Vol 6(1), 43-55.—M. Scriven (1971) has presented a series of formidable arguments against the possibility of explicating the concept of cause in terms of the concepts of sufficient and necessary conditions. Some of his main arguments center on the difficulties of capturing the asymmetry of cause and effect and of handling a certain kind of overdetermination he calls linked overdetermination. Scriven's contention that there is no way to capture the asymmetry of cause and effect is countered in the present study by constructing a definition of the concept of causal priority in terms of the concepts of sufficient condition and necessary condition. His contention that the existence of linked overdetermination undermines the necessary condition features of the definition is countered by distinguishing 2 senses of necessary conditionship. This rebuttal indicates that the common sense view of the cause as a necessary and sufficient condition of its effects may yet prove to be at least roughly accurate.—*Journal abstract.*

1725. **Boneau, C. Alan.** (American Psychological Association, Washington, DC) **Paradigm regained? Cognitive behaviorism restated.** *American Psychologist*, 1974(May), Vol 29(5), 297-309.—Discusses a decision theory-information processing approach to traditional, behavioristically formulated problems as a way of bridging areas such as operant conditioning and information processing. A conceptual scheme is described using behavior-determining variables. It is applied to curriculum design, personality and life style, psychopathology, social psychology, learning theory, and pure cognitive functioning. Structuring the field of psychology from the viewpoint of this scheme is also briefly attempted. The individual is viewed as a gatherer, processor, and user of information rather than as a stimulus reactor to external events. (15 ref)—*R. Tomasko.*

1726. **de Peretti, André** [Structure of the personality and philosophy of man in the thought of Rogers.] (Fren) *Etudes Psychothérapiques*, 1974(Dec), No 18, 229-238.

Traces C. Roger's theorizing on the structure of the personality, showing the influence on Rogers of K. Goldstein and K. Lewin; and discusses Roger's writings on development, growth, and stability (homeostasis) of the personality.—*F. Auld.*

1727. **Ekstein, Rudolf.** (U California, Los Angeles) **Psychoanalytic precursors in Greek antiquity.** *Bulletin of the Menninger Clinic*, 1975(May), Vol 39(3), 246-267.—Attempts to see analogies between the state of affairs now and those during the time when Athens began to decline, in about 400 BC. It is suggested that the men of antiquity had institutions for emergency guidance or psychotherapy (crisis centers) to provide instant and

brief services based on a strong transference to the institution, the representative of the deity. Philosophers, such as Socrates, gave psychotherapeutic services; examples from classical literature are cited. It is not surprising that Freud found that the imagery, mythology, similes, and drama of Greek antiquity helped him formulate the principles that have become the core of mental health services today. (16 ref)—*J. Z. Elias.*

1728. **Erlanson, Douglas K.** (Johns Hopkins U) **The concepts of memory: A study in the philosophy of psychology.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2696-2697.

1729. **Fedida, P.** (U Paris VII, Lab of Pathological Psychology & Psychoanalysis, France) **[Depression and melancholy: Remarks concerning the foundations of a psychopathology.]** (Fren) *Bulletin de Psychologie*, 1974-1975, Vol 28(13-15), 678-683.—"Depression" is discussed with reference to the history of the meaning of the word and the history of the idea. The current forms under which the idea of depression is used functionally in the framework of psychoanalytic psychopathology are presented as questions for study. (16 ref)—*Z. M. Cantwell.*

1730. **Fetzer, James H.** **On the historical explanation of unique events.** *Theory & Decision*, 1975(Feb), Vol 6(1), 87-97.—Notes that philosophers argue that every historical event is actually unique, but that any event may be explained insofar as it happens to be one of a certain kind. Historians protest that this conception ignores the particularity of individual events and especially the fact that such an event may very well be the only one of its kind. As a result, historians tend to dismiss the philosopher's arguments as purely theoretical, while philosophers tend to dismiss the historian's retort as merely methodological. The present paper undertakes an arbitration of this dispute by indicating what appear to be the strengths and weaknesses of both positions, while suggesting the view that more is involved here than either side at various times has been prepared to admit.—*Journal abstract.*

1731. **Francis, John B.** (State U New York, Buffalo) **Theory vs. practice in high-level learning: A response to behaviorism.** *Journal of Individual Psychology*, 1975(May), Vol 31(1), 3-10.—Considers the role conflicts of a behavioral scientist who is studying the process of learning as well as attempting to inspire learning in his students. The possibilities of relating the usefulness of personal responsibility in learning to a rigorous conceptual basis are discussed. New demands and opportunities for responsibility and its personal and social aspects are considered. The behaviorist critique of personal responsibility is described, and strategies for the possible integration of theory and practice noted. The principle of complementarity is borrowed from modern physics to suggest the use of one construct for the theorist and another for the practitioner. (25 ref)—*R. Tomasko.*

1732. **Gagey, J.** (U Paris VII, Lab of Pathological Psychology & Psychoanalysis, France) **[Brief remarks on the concept of time in psychology.]** (Fren) *Bulletin de Psychologie*, 1974-1975, Vol 28(13-15), 660-664.—Presents a short descriptive statement regarding the place of the concept of time in psychology, especially genetic psychology, with reference to P. Fraisse's *The Psychology*

of Time. Distinctions are made between concepts of and of time. Z. M. Cantwell.

1733. Hudgins, Thomas B. (North Texas State U) A comparison of psychoanalysis and pragmatism as they relate to inquiry. *Dissertation Abstracts International*, 1974(Oct), Vol 34(4-A), 1703-1704.

1734. Korman, Thomas A. (Marquette U) Altered states of consciousness: A philosophical analysis of their psychological, ontological, and religious significance. *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2701.

1735. Lunana, Pierandrea. [Aggression and the death instinct from Freud to M. Klein: Theory and clinical comment.] (Ital) *Rivista di Psicoanalisi*, 1972, Vol 18, 135-178.—Reviews the history and development of Freud's thinking on aggression and the death instinct, together with the contributions of other psychoanalysts, especially M. Klein and her school. Following Freud, she studies psychic processes from the instinctual point of view, making the theory of the life and death instincts the link between the 2 thinkers. A clinical case illustrates the concept of destructive narcissism as the focus of the death instinct. (27 ref)—D. Araoz.

1736. Madden, Edward H. (State U New York, Buffalo) To justify or explain in history or social science? *Journal for the Theory of Social Behaviour*, 1975(Apr), Vol 5(1), 3-16.—Analyzes the concept of causality from the perspectives of philosophical psychology and the philosophy of science. The classical view of causality is stated, and the objections to it held by agency theories are noted. The agency theorists' objections are considered mistaken, based on criticisms of any analysis of cause and criticisms of a singularity theory of cause.—R. Tomasko.

1737. Malkin, Edward E. Stoicism and paranoia. *Psychiatry*, 1975(May), Vol 38(2), 186-192.—Discusses the occurrence of a paranoid strain in classical stoic utterances. Theories of paranoia stress a projective process involving male-female role anxiety which was not present in the culture of classical Greece, which accepted homosexuality. Stoicism is noted to have its greatest appeal in times of perplexity and peril that are characterized more by survival-oriented than gender-identification problems. Paranoia is considered culture-bound, arising from fears for survival mediated through opinion. (22 ref)—R. Tomasko.

1738. Materna, Pavel. (U Jan Evangelista Purkyně, Filosofická fakulta, Brno, Czechoslovakia) A formulation of the determinism hypothesis. *Theory & Decision*, 1975(Feb), Vol 6(1), 39-42.—Attempts to formulate, in mathematical terms, what a determinist believes to be true. The formulation is based on some concepts defined in a systems-theoretical manner, mainly on the concept of an experiment over the sets A^n (a set of n -tuples of 'input values') and B^n (a set of n -tuples of 'output values') in the time interval (t_0, \dots, t_n) (symbolically $E[t_0, \dots, t_n, A^n, B^n]$), on the concept of a behavior of the system S^n ($= (A^n, B^n)$) on the basis of the experiment $E[t_0, \dots, t_n, A^n, B^n]$ and indeed, on the concept of deterministic behavior. . . . The resulting formulation of the deterministic hypothesis shows that this hypothesis expresses a belief that we always "could find" some "hidden parameters."—*Journal abstract*.

1739. Mezurecky, Andrew W. (United States International U) Psychodramatics: The genealogy of a clinical modality. *Group Psychotherapy & Psychodrama*, 1974, Vol 27(1-4), 37-41.—Traces the history of archaic forms of psychodrama preceding the discovery of the contemporary method of J. L. Moreno. The use of psychodrama is traced from the ancient Greeks to 20th-century ethnological work done with American Indian tribes. Therapeutic aspects of citizen and audience participation in Greek theater are described, the contributions of J. C. Reil are noted, and the Indian notion that the seeing of what troubles you will take it from your mind is reviewed. It is considered that humans, when left to their own design, are able to create natural clinical modalities to activate their phenomenological insight and potential. (16 ref)—R. Tomasko.

1740. Mironenko, V. V. (Simferopol State U, USSR) [The history and present state of the psychology of expressive movements.] (Russ) *Voprosy Psikhologii*, 1975(May-Jun), No 3, 134-142.—Reviews the history of the study of physiognomy and emotional expression, from antiquity to the present. The views and work of contemporary Soviet psychologists in the area of expressive movements are presented. (21 ref)—L. Zusne.

1741. Moulton, Ruth. (William Alanson White Inst, New York, NY) Early papers on women: Horney to Thompson. *American Journal of Psychoanalysis*, 1975(Fal), Vol 35(3), 207-223.—Discusses K. Horney's early papers (1922-1932) criticizing Freud's phallus-centered point of view and his theory of female sexuality. Among other points, these papers emphasize the social disadvantages of women, stress the positive satisfactions of motherhood, and assert that the vagina plays an important role in female sexuality from early childhood on, and attribute to male narcissism the assumption that penis envy occurs in all females. The views of other prominent psychoanalysts of this period who tended to agree with Horney are summarized briefly. The beginnings of new studies of women in the 1940's dealing with previously neglected cultural factors are also described. (36 ref)—J. Adams-Webber.

1742. Platonov, K. K. (USSR Academy of Sciences, Inst of Psychology, Moscow) [Psychology of religion and atheistic education.] (Russ) *Voprosy Psikhologii*, 1975(May-Jun), No 3, 18-25.—Atheistic education is one of the essentials in developing the new Soviet man. Its scientific basis is the psychology of religion, which is part of social psychology. Various aspects of the psychology of religion are discussed, as are 5 types of Soviet citizens who may be counted as believers. Atheistic education should take into account individual differences and the different reasons for remaining or becoming a believer. The goal of atheistic education is to produce militant rather than passive atheists. (English summary) (18 ref)—L. Zusne.

1743. Postel, J. & Dhote, A. (U Paris VII, Lab of Pathological Psychology & Psychoanalysis, France) [Concerns of a psychotherapist at the end of the French revolution: A "magnetique" (hypnotic) cure in 1797.] (Fren) *Bulletin de Psychologie*, 1974-1975, Vol 28(13-15), 705-716.—Presents a case history illustrating some historical roots of psychoanalysis. Data are related also

to selected current concepts and practices in psychoanalysis. (15 ref)—Z. M. Cantwell.

1744. Postel, J. (U Paris VII, Lab of Pathological Psychology & Psychoanalysis, France) [History and clinical usages of paranoia.] (Fren) *Bulletin de Psychologie*, 1974-1975, Vol 28(13-15), 684-687.

1745. Rausky, F. (U Paris VII, Lab of Pathological Psychology & Psychoanalysis, France) [With regard to the birth of psychotherapy: The "Doctrine des Pères."] (Fren) *Bulletin de Psychologie*, 1974-1975, Vol 28(13-15), 694-704.—Presents an historical descriptive study, focusing on the early 18th century, of the role of the Faculty of Medicine of Paris in the evolving concepts of mental illnesses and the treatment of the mentally ill.—Z. M. Cantwell.

1746. Reisby, Niels. (Kommunehospitalet, Copenhagen, Denmark) **An anti-psychiatry debate of the 1890's.** *Acta Psychiatrica Scandinavica*, 1975, Suppl 261, 15-20.—Discusses the debate of the 1890's which focused, generally, on the relationship between psychiatrists and their patients and particularly that between Knud Pontoppidan, head of the psychiatric department of Kommunehospitalet in Copenhagen, and his patients. Some of the charges brought against Pontoppidan by some of his former patients and the physical conditions in the department at that time are described. The scientific argument in the debate was presented by P. A. Heiberg (1897) who held that by adopting a strictly scientific approach, psychiatry would be reduced to physiology, where mental illness becomes simply cerebral dysfunction; in contrast, an approach based on the humanistic science would include the concept of consciousness, a specific power of mind. Heiberg was the first person in the debate to question the connection between psychiatry and the medical natural sciences and the first to make the relationship with the patient the essential component of psychiatric therapy.—M. E. Pounsel.

1747. Sher, George. (U Vermont) **Charles Taylor on purpose and causation.** *Theory & Decision*, 1975(Feb), Vol 6(1), 27-38.—C. Taylor analyzes purposive action as involving both teleological explicability and intentionality on the part of the agent. This paper examines (a) the adequacy of this analysis of purposiveness and (b) an incompatibility that Taylor finds between purpose, thus analyzed, and causal explicability. It is concluded that there is at least one aspect of the concept of purpose that Taylor's analysis does not capture, and even if his account were correct, it would not rule out the possibility that all actions are caused. *Journal abstract.*

1748. Sugerman, Shirley. (Drew U, Graduate School) **Sin and madness: A transformation of consciousness.** *Psychoanalytic Review*, 1974-1975(Win), Vol 61(4), 497-516.—The concepts of madness as divine, as demonic possession, as unholy, and as a correlative of sin are reviewed in historical perspective, as seen by philosophers and theorists from the ancient Greeks to the present time. (18 ref)—G. S. Speer.

1749. Westmeyer, Hans. (Freie U Berlin, Inst für Psychologie im Fachbereich Erziehungswissenschaften, W Germany) **The diagnostic process as a statistical-causal analysis.** *Theory & Decision*, 1975(Feb), Vol 6(1), 57-86.—The model of statistical-causal analysis devel-

oped by W. Stegmüller (1973) with reference to W. C. Salmon (1970, 1971) is applied to the diagnostic process and suggested as a replacement for the model of inductive-statistical systematization in the context of normative diagnostics (H. Westmeyer, 1972). For a generalization of the model with respect to discrete random variables, an algorithmic construction of the diagnostic process is given generally and then elucidated by a simple example. It becomes apparent that this model avoids important problems which confront normative diagnostics relying on the model of inductive-statistical systematization. (32 ref)—*Journal abstract.*

1750. Yarnbevsikil, M. G. [A. A. Ukhtomskii and the problem of behavioral motivation.] (Russ) *Voprosy Psikhologii*, 1975(May-Jun), No 3, 3-17.—The physiologist Ukhtomskii (1875-1942) contributed to psychology not only his physiological explanation of attention, which is usually thought to be his main contribution, but also his concept of the dominant. The dominant combines the drive and energetic aspects of motivation and goal-directedness into a single concept. The motivational resources of an organism are not limited to instincts and unconditioned reflexes. During both phylogeny and ontogeny new motives appear. The main trend in the development of motives is toward ever-increasing mastery of the environment and not toward achieving an equilibrium with respect to it. (English summary)—L. Zusne.

Research Methods & Apparatus & Computer Applications

1751. Allmer, Henning. (Lehrstuhl für Psychologie, Cologne, W Germany) **Problems of taxonomy programs and automatic classification: A comparative study regarding their applicability.** (Germ) *Psychologische Beiträge*, 1974, Vol 16(4), 605-617.—Applied 2 taxonomic methods to a set of empirical data. On the basis of discriminant analysis, automatic classification led to a 2-group solution while application of the taxonomy program resulted in a main segregate with many single segregates (Taxo 1) as well as interrelated segregates not related to the main segregate (Taxo 2). Considerable agreement was noted between the methods used in groups with matched elements. The differences between group structures due to the methods employed (valid for a set of empirical data) correspond to those found in Baumann's Plasmodium study. (French summary) (16 ref)—*Journal summary.*

1752. Black, David R. **Current status of outcome in group psychotherapy.** *Group Psychotherapy & Psychodrama*, 1974, Vol 27(1-4), 110-118.—Examines reviews, research articles, and case studies to evaluate the problems of studying outcome in group therapy research. Topics considered include patient descriptions, therapeutic variables, clinical impressions, rating scales, sociometric assessment, psychometric tests, observable behavior changes, and long-term follow-up. 3 suggestions for investigators are made: (a) specifying the physical, educational, and personality components of the study population; (b) using a multiplicity of instruments to assess therapeutic effectiveness; and (c) using control and follow-up techniques. (50 ref)—R. Tomasko.

1753. Dimond, S. J.; Bureš, J.; Farrington, L. J. & Brouwers, F. Y. (Czechoslovak Academy of Sciences, Inst of Physiology, Prague) **The use of contact lenses for the lateralisation of visual input in man.** *Acta Psychologica*, 1975(Oct), Vol 39(5), 341-349. Conducted tests with 10 right-handed undergraduates to demonstrate the use of a new method of investigating lateralized hemisphere functions. Specially designed contact lenses were used, which directed visual input to either the left or the right cerebral hemisphere. These lenses are an advance on previous methods used in investigating hemisphere function in that they enable the S to react to stimuli without restrictions on movement and without time limitations on the exposure of stimuli. Investigations of language and visual spatial functions showed that the lenses appeared to be very effective in lateralizing verbal and spatial information.—*Journal abstract*.

1754. Legan, Donald R. (Northern Illinois U) **Differential effects of preexperimental patient-experimenter interpersonal relationships on the reinforced reaction time performance of process-schizophrenics.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2223-2224.

1755. Riegel, Klaus F. & Angleitner, Alois. (U Michigan) **The pooling of longitudinal studies of aging.** *International Journal of Aging & Human Development*, 1975, Vol 6(1), 57-66.—Describes the pooling of 5 longitudinal studies conducted during the last 20 yrs in West Germany. The pooling provides the following improvements: By increasing the number of participants the reliability and precision of the results are improved, and the sample becomes representative of the whole area. Both cohort and age comparisons are improved by extending their ranges, the time-of-testing range is increased from 5 to 17 yrs. It is considered that the extension of the time-of-testing range represents the most important contribution of the present work. Each study adds unique methods to the pool, thus supplementing the common explorations in a constructive manner.—*Journal abstract*.

1756. Sirois, François. (Hôtel-Dieu de Lévis, Canada) **The natural history of neuroses: Problems of methods and substance.** *Canadian Psychiatric Association Journal*, 1975(Jun), Vol 20(4), 273-280.—Considers the methodological problems involved in follow-up studies of neurosis, arguing that wider use of a few standardized measures of adaptation and of symptom patterns would facilitate the development of our knowledge. (French summary) (65 ref)

1757. Taguchi, Tokio. [The optimal probability of selection in some unequal probability samplings: A sampling design for a corporation survey in Japan.] (Japn) *Proceedings of the Institute of Statistical Mathematics*, 1975, Vol 22(2), 87-118.—Examines procedures for 2 basic random sampling methods with replacement: selection with equal probabilities and selection with size-proportionate probabilities; and evaluates 2 stratified random selections with replacement and varying probabilities of selection. Findings were as follows: (a) The conventional stratified sampling of corporations is more efficient than a sampling with equal probabilities of selection. (b) A size-proportionate probability selection from a Pareto population can be generalized to unequal

probabilities of selection with replacement. (c) Size-proportionate probabilities of selection, if they are equal to the logarithmic regression coefficient of X on Y, are best for sampling from a Gibrat population. (d) The logarithmic regression coefficient, logarithmic correlation coefficient, and some allied measurements may be expected to be more effective than the conventional correlation coefficient in choosing the best sampling method. A mixture of sampling methods with equal and size-proportionate probabilities of selection is proposed for actual use. (English summary)—S. Ashida.

1758. Triandis, Harry C. (U Illinois) **Social psychology and cultural analysis.** *Journal for the Theory of Social Behaviour*, 1975(Apr), Vol 5(1), 81-106.—Examines the types of theories and methods used in social psychology. An ideal theoretical framework and methodology are presented for cross-cultural studies which provide a promising paradigm for research. Deficiencies in current theoretical approaches are highlighted, such as the use of variables that account for too little variance in behavior, theories leading to experiments of limited generality, and theories not accounting for complex interactions. Key features of cross-cultural studies are described, including ecological functionalism, cultural general and cultural specific variables, and exploration vs confirmation. (3 p ref)—R. Tomasko.

PSYCHOMETRICS

1759. Bridges, George S. & Lisagor, Nancy S. (U Pennsylvania, Ctr for Studies in Criminology & Criminal Law) **Scaling seriousness: An evaluation of magnitude and category scaling techniques.** *Journal of Criminal Law & Criminology*, 1975(Jun), Vol 66(2), 215-221.—Attempts to display empirically the relationship between magnitude and category scales as measurements of delinquency, on the premise that insight in selecting scale types for delinquency research can be gained by examining whether similar seriousness scores result from these methods. Results indicate that magnitude and category scaling technique produce similar distributions and estimates of seriousness magnitude. This finding provides a validation of psychometric research; the log-linear relation between the scales was demonstrated by simple algebraic transformations of the scale data. More importantly, it assures the criminologist that magnitude and category scales provide similar estimations of the seriousness of delinquency. Both methods are suited to criminological research problems; each, however, has properties that are suitable to specific research needs and must be considered in future analyses.—R. Gunter.

1760. Bürl, A. & A. (Schweizerische Zentralstelle für Heilpädagogik, Lucerne, Switzerland) [Computer-assisted test administration and branched testing.] (Germ) *Psychologie: Schweizerische Zeitschrift für Psychologie und ihre Anwendungen*, 1975, Vol 34(2), 115-128.—Reviews the literature on computerized test administration, which could be highly efficient if techniques of branching or individually tailored testing were used. So far, however, only a few tests have been computer-adapted and administered in their standard version, but the problems of branching have been investigated separately by means

of experimental, theoretical, and simulation studies. Results so far demonstrate that branched testing produces a substantial reduction of test length and testing time at an equivalent level of validity. Little is known about the reliability of branched tests. (French summary) (2 p ref)—*English summary*.

1761. Coleman, John. (London Hospital Medical Coll, England) **Projective techniques: Where do we go from here?** *British Journal of Projective Psychology & Personality Study*, 1975(Jun), Vol 20(1), 29-30.—Discusses the current status of projective techniques in relation to widespread doubts concerning the validity of all psychological tests. It is predicted that future developments in projective testing will include techniques for (a) monitoring therapeutic and other forms of psychological change, (b) interpreting for the individual patient aspects of his own verbal behavior which he does not understand, and (c) studying group processes and crystallizing group interactions.—*J. Adams-Webber*.

1762. Lachenmeyer, Charles W. (St John's U, NY) **Measurement and investigation: Five demands for social science measurement.** *Journal of General Psychology*, 1975 (Oct), Vol 93(2), 173-182.—Presents a logical scheme for analyzing measurement as a social act. On the basis of this scheme, a list of 5 demands is presented that all true measurement satisfies. Among these demands are the following: repetition, planning, replication, unequivocal change, and relations between unequivocal changes in measures. S. S. Stevens' (see PA, Vol 32:4769) psychophysical law is matched against these demands and found to satisfy all but the last. It is concluded that most social science measurement is not as precise or adequate as this example.—*Journal abstract*.

1763. Mikk, Ya. A. (Tartu State U, USSR) **[A method for measuring the difficulty of a text.]** (Russ) *Voprosy Psikhologii*, 1975(May-Jun), No 3, 147-155.—Describes a new method for measuring reading difficulty. 8 measures of difficulty, obtained from the performance of a large number of Ss, were intercorrelated. Factor analysis yielded 2 factors. 30 physical measures of difficulty were correlated with the 8 performance measures, and a regression equation based on the correlational work was computed. Procedures for obtaining the data needed to evaluate the equation is described. It takes about 4 hrs to obtain the reading difficulty index for a text. The formula accounts for about 45% of the total reading difficulty. (46 ref)—*L. Zusne*.

1764. Washington, William N. (Trinity U) **A methodology for response style analysis of the semantic differential index.** *Journal of General Psychology*, 1975(Oct), Vol 93(2), 289-294.—Studied some of the S-related response styles of the semantic differential index (SDI), in order to develop a methodology that would provide more information concerning them. It was hypothesized that Ss would respond differently to familiar and unfamiliar stimuli, so that the responses for each separate stimulus and also the parallel scales combined across the stimuli should be studied. This hypothesis was tested using an analysis of variance design on the responses of 100 Ss (equally divided into 4 categories on the basis of age 8th grade vs college freshman sophomore and sex) to the SD scales and stimuli. Results of the study indicate that it was not the

stimulus per se that was the determining factor in response style investigations but rather the methodology that was used to analyze these responses. This indicates that a methodology similar to the one proposed by this study should be used in future response style analyses. (18 ref)—*Journal abstract*.

Test Construction & Validation

1765. Bottenberg, E. H. & Keller, J. A. **[Contribution to the empirical understanding of self-actualization.]** (Germ) *Zeitschrift für Klinische Psychologie und Psychotherapie*, 1975, Vol 23(1), 21-53.—Discusses the use of a questionnaire assessment in studying the problem of the empirical dimensionality of self-actualization. A factor analysis of 170 questionnaire items of self-actualization resulted in 4 (orthogonal) dimensions: labeled acceptance of self and world, positive reality perspective, existential feeling, and behavior and positivity of human behavior. 3 scales developed to measure the 1st 3 dimensions showed discriminating correlations to questionnaire indicators of 6 personality traits (e.g., neuroticism, extraversion, self-confidence, and achievement orientation).—*S. D. Babcock*.

1766. Burger, Gary K. (U Missouri, St Louis) **A short form of the California Psychological Inventory.** *Psychological Reports*, 1975(Aug), Vol 37(1), 179-182.—Reduced the number of items in the California Psychological Inventory (CPI) from 480 to 240 by selecting items representative of factors obtained by separate factor analyses of the 18 scales. Correlations of the short form with the standard scales (0.78-0.93), the factor structure of the short form, cross-validated regression equations to estimate standard scale scores, and test-retest reliability coefficients (10 days; 0.60-0.89) indicated that the short form is a reasonable alternative to the complete inventory in situations where time savings are required.—*Journal abstract*.

1767. Dittrich, A. (Psychiatrischen Universitätsklinik, Zürich, Switzerland) **[Construction of a questionnaire regarding abnormal mental states.]** (Germ) *Zeitschrift für Klinische Psychologie und Psychotherapie*, 1975, Vol 23(1), 12-20.—Describes the development of a questionnaire on altered states of consciousness, intended to assess experimentally-induced abnormal mental states in normals, and aspects of the psychopathology of endogenous psychoses.—*S. D. Babcock*.

1768. Dussan, Rafael D. (Pontificia U Javeriana, Bogotá, Colombia) **Standardization of the Rosenzweig Frustration Test in the adolescent population of Bogotá in the fifth and sixth years of the classical baccalaureate.** *Mysterium*, 1974, Vol 28(92-95), 137-158.—Administered the Rosenzweig Picture-Frustration Study (the adult form of the Frustration Test) to 864 Ss (405 males and 459 females, 14-21 yrs old) in Bogotá, Colombia, and compared these norms with the norms of an Argentine standardization. Results indicate significant differences between Argentine and Colombian norms. The norms of adolescents from Bogotá are considered applicable to the entire Colombian population. The test's ability to detect unconscious defense mechanisms is noted. (17 ref)—*Author abstract*.

1769. Good, Lawrence R. & Good, Katherine C. (Middle Tennessee State U) **A measure of self-esteem.**

Psychology, 1975(May), Vol 12(2), 32-34.—Presents the Self-Esteem Scale (SES), a self-report measure tested and evaluated with 100 normal subjects and 100 Ss under graduate level. The scale is designed for college and adult populations and is based on the assumption that low self-esteem is indicated by feelings of inferiority, inadequacy, unworthiness, and helplessness. The test results indicate males tend to report higher self-esteem than females. (19 ref.)—*R. L. Jones.*

1770. Heimann, H.; Bobon-Schrod, H.; Schmoecker, A. M. & Bobon, D. P. (Univeritat-Nervenklinik Tübingen, W. Germany). [Self evaluation of mood by a list of adjectives. *Bedürfnisheits Skala (BS) de Zerssen.*] (Fren) *Encephale*, 1975(Feb), NS Vol 1(2), 165-183.—Presents a complete French translation of the D. von Zerssen Self-Rating Scale (ZSRS). Calculations on the validity and reliability of the scale confirm the original German data. A number of other depression and mood scales are discussed in relation to the ZSRS. The ZSRS correlates 0.50 with the Beck Depression Inventory, 0.46 with Zung's Self-Rating Depression Scale, and 0.86 with the Hamilton Rating Scale for Depression. Factor analysis confirmed the ZSRS as a measure of the depths of depression. The test items and a highly reliable alternate form are presented. (45 ref.)—*K. J. Hartman.*

1771. Millman, Howard L. & Davis, J. Kent. (Children's Village, Psychological Services & Research, Dobbs Ferry, NY). Assessing behavioral change: A reliability study of the Devereux Child Behavior Rating Scale. *Devereux Forum*, 1975(Spring), Vol 10(1), 6-12.—Examined the Devereux Scale for use in a residential treatment center. The center children had less problem behavior with less variability than the standardization group. Interrater reliabilities were much lower than the standardization group; pooling data from pairs of raters increased the reliabilities. 5 factors were dropped because of low reliabilities.—*Journal summary.*

1772. Ray, John J. (U New South Wales, Sydney, Australia). Measuring environmentalist attitudes. *Australian & New Zealand Journal of Sociology*, 1975(Jun), Vol 11(2), 70-71.—Developed a scale to measure pro- and anti-environmentalist attitudes in Australia. The final scale of 20 items, with a coefficient alpha reliability of 0.85, is presented.—*R. Bristin.*

1773. Rimé, Bernard & Leyens, Jacques-Philippe. (U Louvain, Belgium). [Data on a self-esteem scale.] (Fren) *Bulletin de Psychologie*, 1974-1975, Vol 28(16-17), 784-787. Reports on a validation study of a French translation of the 23 items concerned with perception of social inadequacy on the self-esteem scale of K. Janis and P. B. Field. Ss were 185 boys and girls 11-13 yrs old. The 23 items appeared to discriminate among this sample within the limits of the study. (17 ref.)—*Z. M. Cantwell.*

1774. Steller, M. & Meurer, K. (U Kiel, Inst für Psychologie, W Germany). [On the reliability of the Q-sort method for measuring changes.] (Germ) *Psychologische Beiträge*, 1974, Vol 16(4), 618-624.—Studied reliability of Q-sort technique of the Self-Ideal-Ordinary Q-Sort. The reliability coefficients for the sorting of self-image and ideal-image can be accepted as satisfactory. The ideal-sort shows a higher temporal constancy than the self-sort. (French summary)—*Journal summary.*

1775. Wilkinson, Norman W. Spontaneous and defensive movement in the children's O.R.T. development of the self. *British Journal of Projective Psychology & Personality Study*, 1975(Jun), Vol 20(1), 15-21.—Describes the CORT, an experimental children's version of H. Phillipson's (1955) Object Relations Technique. Scoring and interpretation are based on a system of 5 categories: spontaneous movement, defensive movement, maturity of perception, areas of difficulty and conflict, and analysis of content. Normative data from the CORT records of 408 children—including normals, psychotics, subnormals, delinquents, and phobics—indicate (a) developing perceptual growth and skills in 2-yr age bands from 4 to 16, (b) sex differences in perception and approach, and (c) differences between children from normal and deprived family backgrounds. 2 case studies with complete CORT protocols are used to illustrate scoring procedures and interpretation.—*J. Adams-Webber.*

1776. Winnubst, Jacobus A. [Het Westerse Tijdsyndroom: Conceptuele integratie en eerste aanzet tot construct validatie van een reeks molaire tijdsvariabelen in de psychologie. (The Western Time Syndrome: Concept integration and preliminary scale construct validation from a survey of molar time variables in psychology.)] (Duth) Nijmegen, Netherlands: Stichting Studentenpers, 1975. 268 p.—Surveys the variables of time perspective, delayed gratification, time anxiety, and time competence in an effort to establish one comprehensive principle, the Western Time Syndrome. A preliminary integration of theoretical orientations is made, and a progress report on validation of the Western Time Attitude Scale is appended.

Statistics & Mathematics

1777. Costner, Herbert L. (Ed). (U Washington, Seattle) *Sociological methodology: 1973-1974*. San Francisco, CA: Jossey-Bass, 1974. xvi, 410 p.—Presents 12 papers which examine the various methodological issues that have been influenced by a causal models approach to sociology, from the assessment of validity to the study of social change. The influence of the causal model, path analysis, and structural equation models is assessed. (19½ p ref)

1778. Gnepp, Eric H. A mathematical reformulation of the persistence of the phobic response. *Psychology*, 1975(May), Vol 12(2), 51-52.—Presents a mathematical relationship between stimulus and response that unifies the concepts of motivation, cognition, and learning. Response is described as a summation over the external environment of several variables, including the threshold of perception, exteroceptor stimuli, feedback, motivation weighting factors, time, decay, and memory.

1779. Hughes, Francis P. (State U New York, Albany) *The robustness of the analysis of covariance to departure from the assumptions of homogeneous regression parameters and fixed and reliable covariate measures*. *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1129.

1780. Kumar, Binod. (Northern Illinois U) *A weighted sign test of significance for the ordinal and the ordered-metric levels of measurement*. *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1133-1134.

1781. Li, Shing T. & Hammond, Joseph L. (US Navy Electronics Lab, San Diego, CA) **Generation of pseudo-random numbers with specified univariate distributions and correlation coefficients.** *IEEE Transactions on Systems, Man, & Cybernetics*, 1975(Sep), Vol 5(5), 557-561.—Presents a procedure for generating correlated random variables with specified non-Gaussian probability distribution functions such as might be required for Monte Carlo simulation studies. Collections of typical numbers generated through the method are evaluated, all cases of which passed the chi-square tests.

1782. Peaucelle, J.-L. [**Dyadic models in sociometry.**] (Fren) *Mathématiques et Sciences Humaines*, 1975, No 48, 5-19.—A method for the Moreno sociometric test of intragroup preferences is presented based on a stochastic model of random choice with parameters estimated from observed data. Deviations from randomness are tested against Chi-square distributions taking into account the dyadic character of mutual attractions and heterogeneity of groups (subgroups). Examples are given for homogeneous and partitioned preference matrices.—M. G Strobel.

EXPERIMENTAL PSYCHOLOGY (HUMAN)

1783. Alegria, Jesus & Delhaye-Rembaux, Martine. (Université libre de Bruxelles, Lab de Psychologie expérimentale, Belgium) **Sequential effects of foreperiod duration and conditional probability of the signal in a choice reaction time task.** *Acta Psychologica*, 1975(Oct), Vol 39(5), 321-328.—Attempted to determine whether the negative relationship usually found between reaction time (RT) and foreperiod duration in the variable foreperiod paradigm is entirely due to sequential foreperiod effects. It has been shown that when a particular foreperiod has been preceded by a longer one on the previous trial, RT is longer than when the preceding foreperiod was equal or shorter. Results of the present study with 12 paid university students show that, when sequential effects were controlled by the elimination of all trials where the foreperiod was shorter than the preceding one, the negative slope of the RT foreperiod function diminished but did not disappear. Results suggest an interpretation of the role of conditional probability of stimulus arrival in terms of variation in the tendency to reprepare when the moment initially chosen for preparation appears to fall short of the moment at which the stimulus is actually presented. (16 ref) —*Journal abstract.*

1784. Cairney, Peter T. (Flinders U, School of Social Sciences, Bedford Park, Australia) **Bisensory order judgement and the prior entry hypothesis.** *Acta Psychologica*, 1975(Oct), Vol 39(5), 329-340.—Used nonparametric signal detection methods to analyze results of 3 order-judgment experiments conducted with a total of 38 undergraduates Ss judged the order of visual and auditory signal pairs. Under one condition they only made the order judgment; under others they made both the order judgment and a decision about the visual or the auditory signal. No tendency to report the attended signal as coming first was evident under the latter conditions, contradicting the predictions of the prior

entry hypothesis, although a significant decrease in sensitivity was observed (18 ref) —*Journal abstract.*

1785. Gorukaya, G. B. (Scientific Research Inst of General & Pedagogical Sciences, Moscow, USSR) [**The effect of EMG feedback on speech muscle afferentation under conditions of mental activity.**] (Russ) *Voprosy Psichologii*, 1975(May-Jun), No 3, 116-122.—Recorded EMG from the extrinsic muscles of the tongue in adult Ss during problem solving. 10 of the Ss who had the most pronounced subvocal speech were then trained to control it through EMG feedback from the tongue muscles. All Ss learned to reduce muscular involvement in thinking. Problem-solving time also decreased with training, but when the EMG began to reach baseline, problem-solving time increased again.—L. Zisner.

1786. Holender, Daniel & Bertelson, Paul. (Inst de Psychologie expérimentale, Bruxelles, Belgium) **Selective preparation and time uncertainty.** *Acta Psychologica*, 1975(Jun), Vol 39(3), 193-204.—Conducted 4 discrete 2-choice reaction time (RT) experiments with a total of 46 19-30 yr old students. Experiments were performed under 2 time-uncertainty conditions provided by constant foreperiods of either 5 or 0.5 sec. The studies were designed to determine whether selective preparation can be maintained over time or whether it is a short-term process. Selective preparation of 1 of the 2 stimuli was induced through a monetary incentive in Exp I and through frequency unbalance in Exp II; it was assessed through prediction in Exps III and IV. With all 3 manipulations the effects of selective preparation and of time uncertainty were found to combine additively. Results support the idea that selective preparation can be maintained over time. On the other hand, the improvement in RT due to a reduction of time uncertainty was achieved by a short-term preparatory adjustment which is not stimulus-specific.—*Journal abstract.*

1787. Indlin, Yu. A. (Scientific Research Inst of Cinematography, Moscow, USSR) [**Observer's activity in the detection situation.**] (Russ) *Voprosy Psichologii*, 1975(May-Jun), No 3, 73-83.—The statistical decision theory has been applied to the psychophysical detection task on the assumption that the observer computes a likelihood ratio that serves as a criterion in decision making. Experimental data produced in support of this assumption have always yielded a good qualitative but not a quantitative fit. A decision-making criterion is identified in the observer which permits an explanation of experimental data not only qualitatively but also quantitatively. This criterion does not require that the observer calculate a likelihood ratio. It is concluded that for this reason the theory of signal detection must be revised since it is based on an incorrect assumption. (English summary) (21 ref)—L. Zusne.

1788. Kirby, N. H. (U Adelaide, Australia) **Sequential effects in an eight choice serial reaction time task.** *Acta Psychologica*, 1975(Jun), Vol 39(3), 205-216.—Data from 6 undergraduates in an 8-choice serial reaction time (RT) experiment using 2 different response-stimulus intervals were examined for sequential effects by separating out the mean RTs for each stimulus following every other stimulus. This analysis revealed differences in performance under the 2 response-stimulus interval conditions not shown by the conventional partitioning of the RTs

into those for repetitions and for nonrepetitions. Results support an explanation of sequential effects in terms of a saving in stimulus identification time, due to the last stimulus acting temporarily as a reference point. —*Journal abstract.*

1789. Mallikarjunan, M. (U Madras, India) **Intra-individual consistency and certain parameters of sequential reaction time.** *Indian Journal of Applied Psychology*, 1974(Jan), Vol 11(1), 18-23.—Conducted 3 experiments with a total of 52 male university graduate and undergraduate students and staff to examine reaction time (RT) consistency and the parameters of sequence arrangement, color coding of a sequence, feedback, and instructional set, in the performance of a discrimination task. Results show that there was intraindividual consistency over days in the complex sequential RT task and that the parameters studied had no effect on sequential RT. —*Journal abstract.*

1790. Singh, B. N.; Thakur, R. C. & Kumar, K. (L. S. Coll, Muzaffarpur, India) **The interactional effects of KR, set and sense modality on reaction time.** *Indian Journal of Applied Psychology*, 1974(Jul), Vol 11(2), 43-46.—Investigated the interdependence of knowledge of results (KR), set, and sense modality and the dependence of these factors on reaction time. 40 psychology undergraduates were used in a $2 \times 2 \times 2$ factorial design experiment. Results indicate that the effects of sense modality and KR were independent of the other factors, while the effect of set depended on KR. —*Journal abstract.*

Perception & Motor Processes

1791. Bertera, J. H.; Callan, J. R.; Parsons, O. A. & Pishkin, V. (Oklahoma City VA Hosp, OK) **Lateral stimulus-response compatibility effects in the oculomotor system.** *Acta Psychologica*, 1975(Jun), Vol 39(3), 175-182.—Measured eye movement reaction time (RT) in simple and choice RT situations in which monaural tones were presented to the left or right ear of 12 right-handed male 22-39 yr olds. In the choice RT conditions, tones of one frequency signaled a left looking response and tones of another frequency signaled a right looking response. In the simple RT condition, tones were presented in 2 blocks signaling right or left looking responses. RTs were measured by electro-oculogram, with electrodes placed over the outer canthus of each eye. In the choice condition, oculomotor RTs were faster when the tones signaling right or left looking were presented in the ears corresponding to the direction of looking than when they occurred in the opposite ear. No such correspondence was present in the simple RT condition. Ss also performed a manual choice RT task. The lateral stimulus response compatibility effects obtained were of the same magnitude as those obtained in the oculomotor response modality. Asymmetry in correlations between oculomotor and manual compatibility effects suggests differential hemispheric mediation. —*Journal abstract.*

1792. Borg, Gunnar. (U Stockholm, Inst of Applied Psychology, Sweden) **On a general scale of perceptive intensities.** *Reports from the Institute of Applied Psychology*, U Stockholm, 1974, No 55, 6 p.—Describes a general scale designed to facilitate intermodal and interindividu-

al comparisons of perceptive intensities. The "maximal" perceptive intensity and the range to the maximum are equal for all Ss and all modalities. The scaling method rests upon the notion of a maximal subjective intensity in one modality (e.g., the taste of sourness) as a reference intensity for all the others. By using a method of cross-modal estimates and calling the notion of the maximum for "100," simple percentage estimates can be obtained making possible direct interindividual comparisons of different perceptions. A pilot study was conducted in which 20 males were required to use this estimation method to rate the degree of physical exertion when working on a bicycle ergometer. The subjective estimates thus assessed were correlated with category ratings according to the Ratings of Perceived Exertion Scale (G. Borg, 1970) and with heart rates. Significant positive correlations were obtained giving support to the validity of the scale. A psychophysical function was also adjusted to the data, giving a power function with an exponent of 1.6, which corresponds to that found in previous studies. —*Journal abstract.*

1793. Krishna, K. P. & Sinha, J. K. (Magadh U, Bodhgaya, India) **Personality adjustment and time perception in normal adolescents.** *Indian Journal of Applied Psychology*, 1974(Jan), Vol 11(1), 24-27.—Hypothesized (a) that sex would not have a significant effect on time estimation in 50 male and 34 female Indian 11th graders and (b) that well-adjusted Ss would estimate time more accurately than would poorly adjusted Ss. Ss were administered the Mohsin-Shamshad Adaptation of the Bell Adjustment Inventory. Time perception was measured by a production method in which Ss were asked to estimate a period of 30 sec by counting aloud at the rate of 1 count/sec. Findings confirm both hypotheses. (17 ref)—*Journal abstract.*

1794. Petit, Anne-Marie. (CNRS Lab de Psychologie Expérimentale, U Provence, Aix-en-Provence, France) **[Adaptation of the equinormal decision model to psychophysics.]** (Fren) *Cahiers de Psychologie*, 1974, Vol 17(1), 1-24.—Discusses the sensorial and decisional aspects of using the equinormal model of signal detection theory in psychophysical experimentation. Based on the hypothesis that response variability can emanate from the presence of internal sound, any perception task is considered not as a task of pure sensory reception but as one of signal detection within sound. The S must choose a criterion to which he refers the sensory data as he receives it; thus a measure of statistical inference is required of him. In a psychophysical procedure, a fixed criterion model is suggested, regardless of the signal magnitude. The indices to be used in the study of the psychometric function and the processes described by these measures are specified (English summary)—E. E. Brown.

1795. Rai, S. N. (Meerut U, Inst of Advanced Studies, India) **A comparison of the time-estimation of music, noise, light-filled and unfilled intervals.** *Indian Journal of Psychology*, 1973, Vol 48(4), 37-43.

1796. Wagenaar, Willem A. (INO, Inst for Perception, Soesterberg, Netherlands) **Stevens vs Fechner: A plea for dismissal of the case.** *Acta Psychologica*, 1975(Jun), Vol 39(3), 225-235. Notes that (G. I.) Fechner's law is based on the assumption that just

noticeable differences (jnd's) can be concatenated to obtain a measure of sensation. S. S. Stevens (1957) argued that measurement of sensation by measuring jnd's is indirect. His direct methods, however, appear to be much less direct than originally assumed. Stevens' implicit assumption that Ss use numbers on an absolute scale appears to be especially unwarranted. Ratio scaling is therefore nothing more than cross-modality matching between the number scale and another modality. This view has 2 consequences. First, it is quite natural to find power functions by cross-modality matching, even when Fechner's law holds for both modalities. Second, if Stevens' power law is true, there will be an overestimation of all exponents by a factor of 2.5. All typical power functions will be concave downward after correction for this effect. It is argued that the discussion boils down to a discrimination between 2 quite similar curve families: log functions and power functions with an exponent below 0.6. The practical significance of this discussion is doubted. (18 ref)—*Journal abstract*.

Visual Perception

1797. Avant, Lloyd L. & Lyman, Paul J. (Iowa State U) **Stimulus familiarity influences perceived duration in prerecognition visual processing.** *Journal of Experimental Psychology: Human Perception & Performance*, 1975(Aug), Vol 104(1)(3), 205-213.—3 experiments with a total of 70 undergraduates further explored the L. L. Avant et al (see PA, Vol 54:2261) finding that, during prerecognition processing, differences in Ss' familiarity with letters, words, and nonwords generate differences in the apparent duration of tachistoscopic flashes. Results replicate and extend the earlier findings, showing apparent duration differences with a variety of verbal stimuli over a range of tachistoscopic exposure intervals. Results also suggest that exposures of stimuli on early trials of an experiment reduce differences in preexperimental stimulus familiarity such that unfamiliar stimuli come to be processed more nearly like familiar stimuli. Familiarity acquired on early trials appears to accumulate at prerecognition levels of processing and to reduce apparent duration differences among stimuli on later trials. (19 ref)—*Journal abstract*.

1798. Beck, Jacob. (U Oregon) **The perception of surface color.** *Scientific American*, 1975(Aug), Vol 233(2), 62-75.—Several experiments suggest that the perception of surface color is determined not only by the wavelength composition of reflected light but also by factors such as illumination cues, surface composition and texture, organizational tendencies, and the viewer's attitude.

1799. Beck, Jacob. (U Oregon) **The relation between similarity grouping and perceptual constancy.** *American Journal of Psychology*, 1975(Sep), Vol 88(3), 397-409. In 2 experiments on whether similarity grouping is based on the retinal or the perceived slopes of lines, a total of 37 observers judged the grouping of diagonal lines when a display of vertical and diagonal lines was presented upright and when it was slanted 75° toward the floor. The floorwise slanting of the display improved grouping, as would be expected if the spontaneous organization of a field into groups is strongly influenced by the

projection-level representation of stimuli. It is suggested that similarity grouping occurs at the readout stage of stimulus processing and involves segregating a field into groups on the basis of extrafoveal stimulus differences that are responded to in parallel or, if sequentially, very quickly and independently of focal attention.—*Journal abstract*.

1800. Bonnet, Claude. (CNRS, U René Descartes, Lab de Psychologie Experimentale et Comparée, Paris, France) **A tentative model for visual motion detection.** *Psychologia: An International Journal of Psychology in the Orient*, 1975(Mar), Vol 18(1), 35-50.—Presents a model which assumes that visual detection of a motion depends on 2 separate systems having different processing requirements. The movingness analyzing system (MAS) would process on the basis of spatiotemporal summation of the impinging energy, while the displacement analyzing system (DAS) would process changes in positions, comparing the actual position of the object with the trace of a previous position. Hypotheses are developed which provide criteria for making distinctions between conditions in which one or the other system is the prominent processor. The MAS would predominate in peripheral vision, at low levels of luminance, short exposure times, fast velocities, and small areas of the object. The DAS would predominate in foveal vision, when the visual motion contains stationary positions and stationary references close enough to the motion track. Data are reviewed which can be handled in the present model. (65 ref)—*Journal abstract*.

1801. Cahill, Mary-Carol. (Fordham U) **Apparent reversals seen by three types of perceiver of the Ames trapezoid illusion.** *Journal of General Psychology*, 1975(Oct), Vol 93(2), 269-279.—3 groups of Ss with normal vision (3 right-handed, right-eye-dominant males in each group), differing in the overall extent to which they perceived illusory oscillation with A. Ames's (see PA, Vol 26:3192) rotating trapezoidal window, were tested for their susceptibility to parameters of the illusion previously shown relevant in unselected samples. Differential response of these 3 perceiver groups to variations in viewing distance and target form was demonstrated; but target pattern produced no significant effects. It is concluded that consideration should be given to the distribution of these perceiver "types" in samples taken to study illusions of oscillatory motion. (18 ref)—*Journal abstract*.

1802. Gauthier, Gabriel M. & Robinson, David A. (U Provence, Lab de Psychophysiologie, Marseilles, France) **Adaptation of the human vestibulo-ocular reflex to magnifying lenses.** *Brain Research*, 1975, Vol 92(2), 331-335.—Presents findings from a study in which 1 S was fitted with telescope lenses with a magnification of 2.1 × and wore them for 5 full days. Vestibulo-ocular reflex (VOR) gains were measured before, during, and after the adaptation period. Results confirm the finding that the VOR is plastic and responds adaptively to any disturbance, external or internal, that creates vestibulo-ocular dysmetria. This adaptation also appears to create internal changes which cause Ss to mislocate objects in space and suggests an interesting method for separating out the ways in which various signals are used by the

brain in calculating the relative location of seen objects.

—L. Gorsev.

1803. **Kaufser, Irene; Morais, Jose & Bertelson, Paul.** (Université libre de Bruxelles, Brussels, Belgium) **Lateral differences in tachistoscopic recognition of bilaterally presented verbal material.** *Acta Psychologica*, 1975(Oct), Vol 39(5), 369-376.—When Ss have to report verbal material presented tachistoscopically simultaneously on both sides of a fixation point, right visual field superiority has been obtained in previous studies using a central task technique (i.e., where a stimulus presented at the fixation point had to be identified before reporting the rest of the material). Without a central task, left visual field superiority has generally been obtained. Exp I, with 16 right-handed paid young adults, tested whether the central task modifies the order of attentional scanning. With 2 normally printed words, right visual field superiority was obtained with a central task and left visual field superiority without it. It was predicted that with mirrored words, the opposite pattern would be obtained, yet here right visual field superiority was obtained both without and with a central task. Exp II, with 8 Ss, showed that the latter result is dependent on scanning order, for it was completely inverted through recall order instructions. It is concluded that lateral differences observed with bilateral presentation cannot be explained without taking account of optional processing priorities.—*Journal abstract.*

1804. **Mack, Arien.** (New School for Social Research, Graduate Faculty, New York, NY) **Perception during pursuit eye movements.** *Psychologia: An International Journal of Psychology in the Orient*, 1975(Mar), Vol 18(1), 51-62.—Discusses a series of illusions which occur during pursuit eye movements (PEMs) and which suggest a complete loss of position constancy during pursuit. An attempt is made to describe these illusions as instances of an underconstancy of perceived position during PEMs rather than as a complete loss of constancy. It is suggested that the underconstancy may result from an underregistration of information concerning PEM rate which is used by a postulated position constancy mechanism in evaluating retinal image displacement in terms of eye movement information. Supporting evidence is presented, and an alternative explanation is briefly considered. (26 ref)—*Journal abstract.*

1805. **Rock, Irvin & Gilchrist, Alan.** (Rutgers State U, Inst for Cognitive Studies) **Induced form.** *American Journal of Psychology*, 1975(Sep), Vol 88(3), 475-482.—By moving a textured background, the impression of motion in the opposite direction was induced in an opaque rectangle containing a narrow slit; the effect of induced form was then tested with 40 undergraduate observers. As a result of this and a vertical displacement of rectangle and background, a stationary element seen within the slit appeared to many observers to be the successive portions of a stationary extended figure revealed by a slit passing in front of it. Results demonstrate that the effect is one of induced form.—*Journal abstract.*

1806. **Rossi, Jean-Pierre.** (CNRS, Lab de Psychologie expérimentale et comparée, U René-Descartes, Paris, France) **[Lateral inhibition and metacontrast.]** (Fren)

Année Psychologique, 1975, Vol 75(1), 7-21.—Conducted 3 experiments (a) to study the evolution of metacontrast as a function of the distance separating masking stimulus and stimulus test, (b) to determine precisely how inhibition processes can disrupt stimulus test identification, and (c) to establish how individual differences already recorded can be modified when Ss are placed in a rapidly changing perceptual situation. The masking figure plays an important role in metacontrast. The effects of masking stimulus on stimulus test were analyzed according to N. Weisstein's inhibition theory, presenting the Ss with stimuli identical to those they are supposed to perceive when they are placed in a situation of metacontrast. The validity of this repetition was justified in the analysis of individual differences found both in this situation and in those dealing with metacontrast. It is concluded that lateral inhibition, even if it explains metacontrast, is not as simple as Weisstein suggests.—*G. Rubin-Rabson.*

1807. **von Benda, Helmut.** (Technische U München, Inst für Psychologie, W Germany) **[Is the structure of mixed up matrices (as the result of a tachistoscopic identification experiment) invariant compared with the degree of the disturbance?]** (Germ) *Psychologische Beiträge*, 1974, Vol 16(4), 526-548.—Under the assumption that the classical tachistoscopic experiment involves a disturbed transaction system in which the disturbance consists of a complication of the perceptual process through short-time visual presentations, covariance of structure of stimuli permutation with degree of disturbance was investigated. Covariance was observed. It is concluded that results of comparable perceptual experiments may not be generalized without qualifications, since the variable of disturbance is not controlled. (French summary)—*Journal summary.*

Auditory & Speech Perception

1808. **Budohoska, Wanda & Szymański, Leszek.** (Nencki Inst of Experimental Biology, Warsaw, Poland) **Backward and forward masking between two speech-like sounds.** *Acta Neurobiologiae Experimentalis*, 1974, Vol 34(6), 723-736.—Studied the interactive effects on 10 normally hearing undergraduate and graduate students of 2 sounds extracted from stationary sounds of natural speech, differing in spectrum only. Each sound lasted 50 msec. Ss became familiar with 20 sounds presented in isolation. Sounds presented in pairs were separated by intervals of 10, 60, 110, and 310 msec, and Ss were required to identify members in each pair. The shorter the interval the stronger was the interference of the 2nd sound in the perception of the 1st sound in a pair. At intervals lasting 310 msec, the 1st sound interfered more strongly with the perception of the 2nd sound. Results suggest that the 1st excitation was extremely susceptible to interference during 10-60 msec, whether the 2nd sound was identified or not. During perception of the 1st sound, the input seemed to be blocked for further incoming stimuli. (19 ref) *Journal abstract.*

1809. **Eckel, K.** (U Salzburg, Physiologie Psychologischen Inst, Austria) **[Tachistaphony measurement of fusion frequency in hearing.]** (Germ) *Zeitschrift für Klinische Psychologie und Psychotherapie*, 1975, Vol 23(1),

6-11.—Worked out through tachistaphony a method for understanding the physiological measurement of speech by means of a rhythmic succession of sound impulses. With binaural stimulus, the understanding of words was retained if the change between the right and left ear occurred at least 300 times/sec. With monaural stimulus 2 new thresholds of time were found. (a) Words could still be understood when the intervals between the sound impulses were 7 times as long, provided that the frequency of change did not fall below 20 cps. The sum of the duration of the single sound impulses within a second must retain a value of $1/6$ – $1/8$ sec to enable the understanding of words. (b) A threshold of time was found within a range of $1/18$ – $1/16$ sec, relating 18 cps to 16 cps frequency of impulse change, where the understanding of words was lost again. This frequency is defined as the fusion frequency for hearing.—S. D. Babcock.

1810. Hillman, Ralph E. (Pennsylvania State U) **A correlational study of selected vocal-verbal behaviors and the test of English as a second language (TOEFL).** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1397.

1811. Karjalainen, Seppo. (U Oulu, Finland) **Monaural and binaural equal-loudness matches for tones of different frequency by automatic audiometry.** *Acta Otolaryngologica*, 1974, Suppl 325, 43 p.—14 14-29 yr old normal Ss compared tones through earphones at sensation levels of 20, 40, 60, and 80 db. Ss regulated the test tone to follow the loudness of a reference tone. Results indicate that a reduction of the initial loudness level differences took place in frequency pairs in which one of the test frequencies was 125 or 250 Hz. Balancing occurred with a sensation level difference exceeding 5 db at only 1,000-4,000 Hz and 1,000-8,000 Hz. A way of establishing recruitment in cases of hearing impairment is suggested. (36 ref)—R. Tomasko.

1812. Long, Glenis R. (J. W. Goethe-Universitat, W Germany) **Some temporal factors in the successive comparison of auditory amplitudes.** *Acta Psychologica*, 1975(Oct), Vol 39(5), 377-392.—Notes that under certain conditions the discrimination of successively presented auditory amplitudes appears to be primarily a function of the time intervals between stimulus onsets rather than of either the duration of the stimulus or the silent interval between the tones (interstimulus interval). Results of the present study, conducted with 3 paid male high school students, are interpreted in terms of a model containing an acquisition process which continues for a set interval (about 600 msec) subsequent to the onset of the stimulus, even if stimulus offset occurs prior to this time. The onset of another stimulus during this period terminates acquisition. The model also includes a memory process which does not start until acquisition is complete. (28 ref) *Journal abstract.*

1813. Marcer, Donald. (U Southampton, England) **The acoustic similarity effect.** *Acta Psychologica*, 1975(Jun), Vol 39(3), 237-239.—Measured the latency of reading 5-word sequences of 3 levels of acoustic similarity (high, low, or zero) using 30 Ss. Highly similar sequences had longer latencies than sequences of low similarity or control sequences. Implications of this

finding for the acoustic similarity effect in short-term memory are discussed.—*Journal abstract.*

1814. Shor, Ronald E. (U New Hampshire) **An auditory analog of the Stroop test.** *Journal of General Psychology*, 1975(Oct), Vol 93(2), 281-288.—With the use of a tape-recorded auditory method of stimulus presentation, 112 undergraduates were required to identify the tonal concepts of high and low when these concepts were symbolically coded both in terms of high and low pitches of voice and by the spoken words "high" and "low." Trials consisted of 44-item sequential identifications of the concepts. Results are consistent with those in other realms. With use of a speeded accuracy criterion, it was found that Ss could identify the concepts faster from word symbols than from pitch symbols and faster from the 2 types of symbol information correctly matched than from either component type alone. More interference was produced when half of the symbols on a trial were mismatched and the other half matched than when all of the symbols were mismatched. Interference effects in both directions were found, but there was a larger interference of words on pitch than of pitch on words. (20 ref)—*Journal abstract.*

1815. Sullivan, Jane E. (State U New York, Albany) **The effect of dialect interference and response focusing on the assessment of auditory discrimination.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1141.

Cognitive Processes

1816. Bonoma, Thomas V. (Illinois Mental Health Inst, Inst for Juvenile Research, Chicago) **A methodology for the study of individual and social choice behaviour.** *Journal for the Theory of Social Behaviour*, 1975(Apr), Vol 5(1), 49-62.—Studied the adequacy of a subjective expected utility model of human choice behavior. Rather than measuring probability or utility scales from Ss' choice behaviors, this information was provided, and choice behavior measured directly. A modified choice dilemma opinion questionnaire was administered to over 300 Ss, and the instrument was considered an effective way of accounting for choice behavior. Results indicate that the sex role-appropriateness of the decision task promoted decision differences rather than the phenotypic sex of the Ss. (25 ref)—R. Tomasko.

1817. Chiseri, Michael J. (George Mason U) **Amenability to incorrect hypothesis in the extinction of conservation of weight in college students.** *Merrill-Palmer Quarterly*, 1975(Apr), Vol 21(2), 139-143.—Examined the possibility that Ss showing high rates of abandonment of conservation may have been affected by pretests which sensitized them to the issue of conservation. An apparent violation of weight conservation was demonstrated to 47 college students, 25 of whom had been given a pretest survey on the concept of conservation. The pretested group was significantly more likely to accept the "disproof" as factual. It is concluded that past studies showing high rates of extinction of conservation have been affected by this artifact.—W. R. Street.

1818. Chmut, T. K. (USSR Academy of Pedagogical Sciences, Scientific Research Inst of General & Pedagogical Psychology, Moscow) **[The assessment of the**

probability of events in the process of search by children.] (Russ) *Voprosy Psikhologii*, 1975(May-Jun), No 3, 103-110.—Studied probabilistic choices in 22 Ss aged 10-11. The task was to ascertain the connections between a lamp and a number of keys, one or several of which could turn it on. The lamp-key connections and the allowable search strategies were varied. In the initial stage of search, Ss tested hypotheses in the following order of preference: hypotheses about key groups consisting of 1-3 keys, hypotheses about key groups containing contiguous and extreme elements in a row, and hypotheses about key groups yet to be searched. The probabilistic structure of the situation, preferences of the Ss, the complexity and difficulty of the problems, and the order of their presentation also affected the dynamics of probability assessment. Spatial preferences influenced response variability more than the qualitative factors of the search situations. (English summary) (17 ref)—*L. Zuse.*

Montreal, July 28-August 4, 1974.] (Fren) *Bulletin de Psychologie*, 1974-1975, Vol 28(16-17), 827-830.—Summarizes the content of research papers on cognitive processes organized under these themes: general studies, explicit use of selected variables, and studies in individual differences in performance.—*Z. M. Cantwell.*

1826. **Gray, Gail S.** (Pennsylvania State U) The effects of sentence transformations and semantic relationships on ease of sentence processing. *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1127.

1827. **Gude, Chris & Zechmeister, Eugene B.** (Loyola U, Chicago) Frequency judgments for the "gist" of sentences. *American Journal of Psychology*, 1975(Sep), Vol 88(3), 385-396.—108 undergraduates were shown a series of sentences in which some sentences were repeated in either identical or paraphrased form and with 0, 4, or 8 sentences between repetitions. At test, frequency judgments were requested on the basis of either the exact wording or the underlying meaning, the gist, of the sentences. Results indicate that frequency can be indexed independently for both wording and meaning. A spacing effect was found for the judgments of repeated identical sentences but not for those of repeated gists of sentences.—*Journal abstract.*

1828. **Harris, Mary B.** (Ohio State U) Modeling influences on creative behavior. *School Psychology Digest*, 1975(Win), Vol 4(1), 29-33.—Discusses the influence of modeling on creative behavior in language, anagram problem solving, and divergent thinking. Conclusions drawn from past studies conducted by the author indicate that (a) modeling can influence the amount of complex, flexible, divergent, or creative behavior shown by Ss; (b) modeling effects operate over a wide age span; and (c) external pressures to imitate are not necessary for modeling to affect cognitive and creative behaviors.—*J. Prus.*

1829. **Hussy, Walter.** (Universität Trier, W Germany) Information processing and human sequential predictive behaviour. *Acta Psychologica*, 1975(Oct), Vol 39(5), 351-367.—Analyzes human sequential predictive behavior in relation to information theory and information processing theory. The problem consists of the sequential prediction of stochastic-ergodic series of symbols. These sequences are described in terms of information theory (objective structure of the task) and the problem solving process in terms of information processing theory (problem space). The predictions of the behavior of 80 18-26 yr old paid students, deduced from task environment and problem space, were confirmed by statistical analyses of the observed experimental behavior. (19 ref)—*Journal abstract.*

1830. **Ishiguro, Keiko.** [Deprivation and satiation effects of a social reinforcer and the behaviors of the recipient.] (Japn) *Japanese Journal of Educational Psychology*, 1975(Jun), Vol 23(2), 78-86.—Studied the effect of satiation and recovery on task performance of 20 6-yr-old children. In Exp I, the differential effect of satiation in relation to different length of recovery periods was examined. In Exp II, the experimental group was given a reading task during the recovery period, while the control group consistently engaged in the same activity (card sorting). Results indicate that the social deprivation-satiation effect depends not only on stimulus

conditions but also on relevant cognitive variables. (English summary) (17 ref)—S. Chao.

1831. Kieras, David F. & Greeno, James G. (Carnegie Mellon U) **Effect of meaningfulness on judgments of computability.** *Memory & Cognition*, 1975(Jul), Vol 3(4), 349-355.—Conducted 3 experiments with a total of 130 undergraduates in which, after memorizing a set of 4 equations, Ss were given problem frames specifying an unknown variable and 2, 3, or 4 given variables. The task on each item was to judge whether the presented variables corresponded to a problem that could be computed. The main finding was a strong interaction: With formulas consisting of uninterpreted letters, judgments of uncomputable items were much slower than judgments of computable items; however, the difference between positive and negative items was much smaller when formulas consisted of meaningful concepts. Attempts to remove the interaction by presenting the nonsense formulas as an integrated network or by using a format allowing easy chunking of the variables in each formula did not succeed. It appears most promising to investigate effects of meaningfulness on basic component processes, such as decisions about whether pairs of items come from the same formula.—*Journal abstract*.

1832. Křivánek, Zdeněk & Zdráhal, Artur. (U Karlova, Pedagogická fakulta, Prague, Czechoslovakia) [Individual differences in solving a problem situation of a geometrical nature.] (Czec) *Československá Psychologie*, 1974, Vol 18(2), 127-140.—Studied individual and group differences in solving individual games and a set of 7 geometric mosaics. No significant differences were found as a function of intelligence, as measured by the Progressive Matrices (Raven). Individual games were solved by rapid rational analysis or perception and by trial and error. Analysis of the 7-game sets identified 3 types of solutions: (a) characterized by the ability to perceive interrelationships at the beginning of the test; (b) in which the algorithms of solution were found during the test; and (c) where solutions were not found within the same limits. Performance improved most in the 1st games of the series with a decrease in the use of advantageous strategies in the following games. (Russian & English summaries)—P. Babarik.

1833. Matova, M. A. (Scientific Research Inst of General & Pedagogical Psychology, Moscow, USSR) [Capacity for mental work under conditions of maximum intensity of muscular activity.] (Russ) *Voprosy Psikhologii*, 1975(May-Jun), No 3, 47-55.—Observed the solution of simple arithmetic problems during extreme physical exertion in 12 female and 19 male sportsmen. Ss were urged to work to the limits of their endurance on an exerciser that required ever-increasing effort. Tests of mental performance were given before, during, and after the exercise. Time required for solving the problems and errors made were recorded. Several relationships between mental performance and stages of extreme physical exertion were noted, as well as individual differences in behavior under physical stress. In most cases mental failure set in before physical exhaustion. Another unexpected finding was temporary echolalia in the final stages of exertion. (English summary) (18 ref)—L. Zusne.

1834. Mayer, Richard E. & Greeno, James G. (Indiana U) **Effects of meaningfulness and organization on problem solving and computability judgments.** *Memory & Cognition*, 1975(Jul), Vol 3(4), 356-362.—4 experiments were conducted in which, when a total of 140 female and 24 male paid undergraduates were required to calculate answers for computable problems and answer questions, an interaction was found corresponding to that obtained by D. E. Kieras and J. G. Greeno (see PA, Vol 55: Issue 2) from judgments of computability. With nonsense formulas, much longer times were required to identify noncomputable problems than to compute answers, with a much smaller difference when formulas consisted of meaningful concepts. The better performance on noncomputable problems and questions with meaningful formulas corroborates an interpretation that those items test the connection of algorithms with general conceptual knowledge. For relatively complex problems, solution times and time to judge computability were longer if nonsense formulas were learned in separate sets than if they were learned in a single set; however, no such effect was found with meaningful formulas. It is concluded that learning conditions influenced the integration of cognitive structure in the case of nonsense formulas, while Ss were able to adjust organization of the meaningful formulas.—*Journal abstract*.

1835. Millar, K. (U Dundee, Scotland) **Processing capacity requirements of stimulus encoding.** *Acta Psychologica*, 1975(Oct), Vol 39(5), 393-410.—Examined processing capacity requirements of stimulus encoding in the light of conflicting evidence from studies by M. I. Posner and S. Boies (see PA, Vol 47:2073) and by E. M. Comstock (see PA, Vol 51:10353). Capacity demand was assessed by impairment in performance of 32 graduate and undergraduate students on a secondary probe detection task at the moment of encoding on the primary task. Results support Comstock's conclusion that stimulus encoding does require processing capacity, and relate capacity demand to the level of encoding difficulty. Evidence suggests that it costs more capacity to share attention between 2 modalities rather than within one. The importance of secondary task sensitivity in assessing capacity requirements is illustrated. (19 ref)—*Journal abstract*.

1836. Mistler-Lachman, Janet L. (U Houston) **Queer sentences, ambiguity, and levels of processing.** *Memory & Cognition*, 1975(Jul), Vol 3(4), 395-400.—45 paid student volunteers judged linguistic strings to be "meaningful" or "meaningless." Meaningful sentences were identical for all Ss; however, for each of 5 groups, meaningless foils containing different kinds of linguistic violation were interspersed among the meaningful sentences. Type of foil influenced processing time for meaningful items, suggesting that laboratory language processing may be determined by the entire set of linguistic material used. Effect of foil type on comprehension depth for meaningful items was assessed from the extent to which 3 kinds of ambiguity slowed judgments on those items as compared to unambiguous sentences. Foil type appeared to affect depth of meaningful sentence processing in such a way as to support a "levels of analysis" view of sentence compre-

bension. Foil type and kind of ambiguity interacted to suggest that sentence comprehension requires computation of underlying logical relationships prior to computation of surface structural relationships and the unequivocal determination of word meanings.—*Journal abstract.*

1837. Moeser, Shannon D. (Memorial U Newfoundland St John's, Canada) **The effect of reference field organization on language processing.** *Memory & Cognition*, 1975(Jul), Vol 3(4), 370-374.—Exposed 40 paid undergraduates to a miniature artificial language in which auditorily presented nonsense words were correlated to a visually presented reference field. Both the organization of the reference field and the order of words were manipulated to test whether Ss were encoding on the basis of an English-based semantic code or a code based on the nonverbal reference field. Results indicate that the code used was based on the organization of the nonverbal reference field. (18 ref)—*Journal abstract.*

1838. Natadze, R. G. [Methods for the experimental study of concept formation.] (Russ) *Voprosy Psikhologii*, 1975(May-Jun), No 3, 143-146.—Presents the 1st part of a 2-part paper dealing with the approach to the study of concept formation used by the Georgian school of psychology. Traditional approaches are examined and their defects noted. The abstraction of common elements presented by an E in conjunction with artificial concepts is contrasted with the abstraction of meaningful communalities that characterizes concept formation in natural situations. The requirements to be met by experimental designs for laboratory study of concept formation are enumerated.—*L. Zusne.*

1839. Paivio, Allan. (U Western Ontario, London, Canada) **Imagery and synchronic thinking.** *Canadian Psychological Review*, 1975(Jul), Vol 16(3), 147-163.—Argues that imagery involves synchronously organized informational structures that contribute to the richness of content, flexibility, and speed of thinking. By contrast, verbal processes are characterized by a higher degree of sequential constraint, which limits memory content and flexibility but contributes logical direction to thinking. Specific experimental evidence is presented on the implications of these views in regard to the encoding, storage, and retrieval of organized cognitive information. (1½ p ref)—*Journal abstract.*

1840. Rosch, Eleanor. (U California, Berkeley) **Reply to Loftus.** *Journal of Experimental Psychology: General*, 1975(Sep), Vol 104(3), 241-243.—Replies to E. F. Loftus's (see PA, Vol 55:Issue 1) objections to the author's research which studied the structure and content of cognitive representations of semantic categories. Loftus's methodological, conceptual, and theoretical objections are rebutted, and the post hoc nature of Loftus's attempt to apply a spreading-activation theory to the author's findings is discussed.

1841. Tokayer, Sidney S. (U North Carolina, Chapel Hill) **Cognitive style: Its relationship to quantity of information processed.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2402-2403.

1842. Van der Heijden, A. H. & Wolters, G. (Rijksuniversiteit Leiden, Psychologisch Inst, Netherlands) **[Coquettish glances toward reading.]** (Duth) *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1975(Jun), Vol 30(4-5), 303-335.—Discusses the processing

of visual information (VI). This processing indicates that the visual image of objects (VIO) operates slightly longer than eye contact with the object (G. Sperling, 1970). The VIO endures 1-2 sec. The VI is coded as auditive-linguistic representations in the immediate memory. The VIO lasts only about 400 msec, and the immediate memory is too short for the recognition process to occur. A buffer is postulated to exist between the VIO and the immediate memory. Also, a multistore characteristic of memory is suggested to consist of sensory information, immediate memory, and long-term memory. A model of a storage system of memory postulated that all information is organized in parallel patterns and operates in several stages of activation (D. A. Norman, 1968). In long-term memory, automatic associations and relationship in the activation process between stimuli can be established. Parts of the activation process, based on expectancy patterns, are selected for further processing. The reading process illustrates the operations of the model. (113 ref)—*A. J. Ter Keurst.*

1843. Yukawa, Takako. [Effect of affiliative interaction with a model on a classification task.] (Japn) *Japanese Journal of Educational Psychology*, 1975(Jun), Vol 23(2), 119-124.—Modified a previous study by T. Yugawa (1974) which verified children's identification with a model in learning vocabularies. 20 3-person groups of 2nd graders, assigned to 1 control and 2 experimental groups, classified geometric figures under 3 different conditions: (a) with a model who had previously had personal affiliation with Ss, (b) with a model who was familiar but had no personal affiliation, (c) with an unfamiliar model. Results support the hypothesis that affiliative interaction between a model and children in which children recognize cognitive characteristics of the model facilitates children's identification with the model.—*S. Choe.*

Learning & Memory

1844. Albert, D. & Schulz, U. (Philipps U, Fachbereich Psychologie, Marburg/Lahn, W Germany) **A model for free recall of two lists: Individual recall sequences and the effect of list-2-dominance.** *Acta Psychologica*, 1975(Jun), Vol 39(3), 161-174. Outlines a free recall model which assumes a probability search for 2 kinds of items within 1 search set. For testing the model, data of an experimental group in Exp II by D. Albert (1973) were reanalyzed using 24 Ss. Predictions for individual recall sequences are derived, and an explanation for the effect of list 2 dominance is suggested. An index of dominance is also given. (21 ref) *Journal abstract.*

1845. Armelius, Bengt-Ake & Armelius, Kerstin. **Integration rules in a multiple-cue probability learning task with intercorrelated cues.** *Umea Psychological Reports*, 1975, No 80, 17 p. Studied how Ss use cues in multiple-cue probability learning (MCPL) tasks by having 24 undergraduates complete a questionnaire about how they had made their predictions. The questionnaire was administered after Ss had completed learning of a 2-cue suppressor variable task for 100 trials. For 19 Ss, it was possible to develop 3 models on the basis of their verbal reports: linear, configural, or estimated weights models. Goodness of fit of the models

and the actual responses of the Ss was satisfactory. 10 Ss reached a higher level of performance than expected if they used only the information provided by the cue criterion correlations. Performance was highest for Ss using a linear model, while achievement for Ss using an estimated weights model was low due to low consistency. Performance of Ss using configural models was relatively poor because of the low validity of configural models in the present task. Configural models, however, were as easy to follow as linear models. It is concluded that it is possible to use Ss' verbal reports to study strategies used in MCPL tasks and that it is probably necessary to do so since very different psychological processes may be expressed in the same mathematical model. 1846. Bellezza, Francis S.; Winkler, Henry B. & Andrasik, Frank. (Ohio U) **Encoding processes and the spacing effect.** *Memory & Cognition*, 1975(Jul), Vol 3(4), 451-457.—Conducted 3 experiments with a total of 112 undergraduates to test the differential encoding theory of the spacing effect, using E. Martin's (see PA, Vol 43:294) encoding variability notion in which it is hypothesized that low-meaningfulness items are more variable in their encodings than are high-meaningfulness items. Using a continuous paired-associate learning task, it was predicted that the spacing vs performance curves for consonant-consonant-consonant items would show a faster improvement in performance than would the curves for high-meaningfulness consonant-vowel-consonant items. None of the experiments supported this prediction. In addition, it was found that items recognized on their 2nd presentation were more likely to be recalled than were those items not recognized. It is concluded that an item's repetitions are more effective if 1 code is formed and elaborated with each repetition rather than if more than 1 code is formed. (23 ref)—*Journal abstract.*

1847. Bhatnagar, Meenakshi & Sen, Anima. (U Delhi, India) **The effect of the Von-Restorff phenomenon on different temporal positions in free learning.** *Indian Journal of Psychology*, 1973, Vol 48(4), 53-63.—Studied the Von Restorff effect in a free learning and memorizing task, in terms of the order of retrieval of items when isolation was introduced in different positions of the stimulus field. 8 college students were Ss; 3 lists and a 4×4 Latin square design were used. Results show that the order of retrieval was not favored in any of the stipulated positions.—*B. Roy.*

1848. Bhatnagar, Meenakshi & Sen, Anima. (U Delhi, India) **The effect of the Von-Restorff phenomenon on different temporal positions in serial learning.** *Indian Journal of Psychology*, 1973, Vol 48(4), 44-52.—Isolation was introduced in the 2nd, 8th and 14th positions of 3 different lists and a control list. Data were collected from 8 college students, using a 4×4 Latin square design. Results indicate that the nature of the classical serial position curve can be changed through introduction of isolation in the middle of the list.—*B. Roy.*

1849. Bol'shunov, Ya. V. (Ulyanovsk Pedagogical Inst, USSR) [Differences between brief and full reproduction of a text in young schoolchildren.] (Russ) *Voprosy Psikhologii*, 1975(May-Jun), No 3, 56-61.—Observed recall of narratives by 56 schoolchildren in the 2nd and 3rd grades. The narratives were presented twice to each

S, who then retold them under 2 sets of instructions: (a) to give just the main points or (b) to retell the story fully. While most children were able to retell the story in full detail (the frequency of reproduction of the 29 main ideas varied from 48 to 98%), presenting only the main points created considerable difficulty. The various types of omission and alterations in the abbreviated narratives were analyzed in terms of the specific mental operations involved. In general, it was observed that the retelling of narratives by young schoolchildren shows the same characteristics as the solution of mental problems. (English summary)—*L. Zusne.*

1850. Brewer, William F. (U Illinois, Champaign) **Memory for ideas: Synonym substitution.** *Memory & Cognition*, 1975(Jul), Vol 3(4), 458-464.—In 3 experiments a total of 172 undergraduates memorized sentences that contained a word with a synonym in English. There were large numbers of synonym substitution responses in recall (varying from 6.0% in Exp I to 27.7% in Exp III). Synonym substitution responses tended to be unidirectional and occurred with roughly equal frequency in abstract and concrete sentences. Results are interpreted as opposed to surface structure theories of sentence memory, since explanation in terms of word associations and sequential dependencies proved unsuccessful. Results are also taken to be opposed to image theories of sentence memory, since image theories predict few if any synonym substitution responses for abstract sentences, while Exp III found large numbers of synonym substitutions in both abstract and concrete sentences. Findings support the position that memory for sentences is in terms of nonlinguistic, nonimage, abstract representations (ideas). (20 ref)—*Journal abstract.*

1851. Burgess, Ian S. (Manchester Polytechnic, School of Psychology, England) **Some problems associated with response-independent reinforcement.** *Journal of Behavioural Science*, 1974, Vol 2(2), 25-31.—Response-independent reinforcement (RIR) has been seen as an alternative method of extinction. Evidence is presented from the literature which suggests that this is not the case. There is now good ground for differentiating between RIR and conventional extinction. It is also shown that the grounds for asserting that RIR is indeed response independent are none too firm. Basic information on RIR is needed, and several lines of research are suggested. 1852. Burrows, David & Solomon, Barry A. (State University Coll New York, Brockport) **Parallel scanning of auditory and visual information.** *Memory & Cognition*, 1975(Jul), Vol 3(4), 416-420.—Presented 76 undergraduates in Exp I with memory sets of 1, 2, or 4 stimuli and then with a test item to be classified as belonging or not belonging to the memory set. In Condition 1 each memory stimulus was a single auditorily presented letter. In Condition 2 each memory stimulus was a visually presented letter. In Conditions 3 and 4 each memory stimulus was a pair of letters, one presented visually and the other auditorily. Mean reaction time (RT) for the classification task increased as a function of number of memory stimuli at equal rates for all 4 conditions. This is interpreted as evidence for a parallel scanning process in Conditions 3 and 4 where the auditory and visual items of each memory stimulus pair could be scanned

simultaneously. Exp II with 16 Ss compared memory retrieval for a simultaneous condition in which auditory and visual memory items were presented as pairs, with a sequential condition in which mixed auditory-visual memory sets were presented 1 item at a time. RTs were shorter for the simultaneous condition. This is interpreted as evidence that parallel scanning may depend upon memory input parameters.—*Journal abstract.*

1853. Degouys, J. (CNRS, Equipe de Recherche, Lab de Psychologie, U Poitiers, France) [**Specificity in learning and memorizing sentences.**] (Fren) *Année Psychologique*, 1975, Vol 75(1), 87-96.—40 Ss studied 20 highly specific (Sp+) and weakly specific (Sp-) sentences, each containing the name and characteristic of an object, and their recall was tested 3 wks later. Sp+ sentences were better remembered than Sp- sentences, but more frequent use of Sp+ sentences may account for the difference more than does the degree of specificity; however, the superiority was less clear after 3 wks. An explanation lies in the subjective organization of semantic memory.—G. Rubin-Rabson.

1854. Denis, Michel. (U Paris X, Lab de Psychologie de la Culture, Nanterre, France) [**Memorization of imaged or verbal material in terms of imagery activity preliminary to learning.**] (Fren) *Année Psychologique*, 1975, Vol 75(1), 77-86.—Under 3 conditions (no imagery, and 1 or 2 successive periods of imagery), 168 17-29 yr old students learned a list of 30 familiar objects presented either as nouns or verbs, after a preliminary learning of the same objects by an imagery task. Pictures were recalled better than nouns. The imagery task had a positive effect on relearning, clear on noun learning and weaker on pictures. Results are interpreted in terms of interference effect between S's own images preliminary to learning and specific imaginal representations elaborated from figural components of picture stimuli. (16 ref)—G. Rubin-Rabson.

1855. Ehrlich, Marie-France. (CNRS, Lab de Psychologie expérimentale et comparée, U Paris, France) [**Methods of learning and long term memory of sentences.**] (Fren) *Année Psychologique*, 1975 Vol 75(1) 97-107.—Studied the influence of modality of presentation on the learning of 8 sentences comprising 7 elements, 3 nuclear and 4 modifying, each S receiving 10 trials. In Group 1 (cumulative method), nuclear elements were presented at the 1st 2 trials, and the modifiers were introduced progressively over successive trials. In Group 2 (classical method), all elements were presented at the 1st trial. The 2 groups showed identical performance at the final learning trial. However, a week later Group 1 showed better performance. Progressive introduction of new elements into the nuclear sentence appeared to facilitate the organization of strong structures, hence leading to better retention. (18 ref)—G. Rubin-Rabson.

1856. Epstein, William; Wilder, Lucinda & Robertson, Lynn. (U Wisconsin, Madison) **The effect of directed forgetting on the time to remember.** *Memory & Cognition*, 1975(Jul), Vol 3(4), 401-404.—In 2 experiments with a total of 61 university students, a recognition memory task was used to determine whether the search set is reduced by cuing S to forget a part of the input. Correct recognition reaction time (RT) was used to infer

the size of the search set. The principal results show that RT on forget trials was faster than RT on remember trials and that RT was fastest when the forget cue was presented at the outset of the trial rather than after the material had been presented. These findings are generally consistent with the hypothesis that selective search is responsible for the enhancement of recall produced by forget instructions in earlier studies.—*Journal abstract.*

1857. Fraisse, Paul & de Matzkin, Celia. (CNRS, Lab de Psychologie expérimentale et comparée, U René Descartes, Paris, France) [**Mnemonic and numerical span of two successive collections of letters or dots.**] (Fren) *Année Psychologique*, 1975, Vol 75(1), 61-75.—Explored the limits of apprehension span by successive tachistoscopic presentations of 2 cards of letters and dots. Span increase was observed when the interval between the cards was at least 200 ms, a duration necessary for decoding information on the 1st card before presentation of the second. An interval of 650 ms doubled the numerical span but increased letter span by only 50%. It is concluded that letter span is limited by storage and short-term memory processes, but these factors do not limit the numerical span for memorizing only 2 digits. (24 ref)—G. Rubin-Rabson.

1858. Freeman, John F. (U Arizona) **Differential clues employed in word recognition for known and unknown words.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1126.

1859. Gakhar, S. & Luthra, Sushma. (Guru Nanak U, Amritsar, India) **Serial learning as a function of anxiety.** *Indian Journal of Applied Psychology*, 1974(Jul), Vol 11(2), 39-42.—Grouped 135 9th- and 10th-grade females into high, average, and low anxiety categories according to their scores on S. Sharma's manifest anxiety scale. Ss were given a serial verbal learning task using a reproduction method. Results demonstrate the poor performance of the high anxiety group.—*Journal abstract.*

1860. Giambra, Leonard M. (National Inst of Child Health & Human Development, Gerontology Research Ctr, Baltimore, MD) **Altering the concept learner's desire for nonexemplars of the concept: The effect of nonexemplar initial instances.** *Journal of General Psychology*, 1975 (Oct), Vol 93(2), 213-232.—Performed 5 concept attainment experiments with 340 university students: the selection procedure was used. The effect of initial instance was studied under (a) the attribute identification and complete learning tasks, (b) 2 kinds of criteria of success, (c) different amounts of experience with each type of initial instance, (d) a history of all-exemplar or all-nonexemplar initial instance, (e) 1 or 2 irrelevant dimensions, and (f) 2 or 3 values for each dimension of the stimulus universe. Furthermore, the effects of certain interactions of the variables of (a) to (f) were investigated. The generality of any effects across concept rules was ascertained by using the affirmation, negation, conjunction, alternate denial, inclusive disjunction, joint denial, conditional, exclusion, biconditional, and exclusive disjunction rules. The general finding that nonexemplar initial instances enhanced desire for nonexemplar stimulus instances was moderated by the other independent variables, singly and in concert. *Journal abstract.*

1861. Goel, Manju & Sen, Arun K. (U Delhi, India) **Retroactive inhibition as a function of temporal position of interpolated task.** *Indian Journal of Applied Psychology*, 1974(Jul), Vol 11(2), 51-59.—Studied retroactive inhibition in relation to 3 different temporal positions of an interpolated task in an experiment with 32 17-25 yr olds matched for age, sex, and memory span for digits. Ss were divided into 1 control and 3 experimental groups. Results show that (a) intervening activity interfered with the reinstatement of the previously acquired performance, (b) an equal amount of retroactive inhibition was noted when interpolated activity occurred immediately after original learning and just prior to recall, and (c) greatest retroactive effects were observed when interpolated activity occurred between learning and recall tests. Serial position effects were also analyzed, and the results are in agreement with J. W. McCrary and W. S. Hunter's (see PA, Vol 27:7637) generalization. (18 ref)—*Journal abstract*.

1862. Halff, Henry M. (U Illinois, Champaign-Urbana) **Stimulus presentation after successes and errors in concept identification.** *American Journal of Psychology*, 1975(Sep), Vol 88(3), 421-430.—M. Levine's (1966, 1969) theory of concept identification suggests that more extensive processing follows errors than successes. The role of memory for the stimulus in this processing was studied by asking 40 practiced female college students to solve 16 simultaneous discrimination problems, each of which had 8 dimensions, one of them relevant. Hypotheses were monitored by Levine's blank-trials technique, and each S was run in 1 of 4 conditions depending on whether the stimulus (the positive member of the display pair) was or was not (re-)presented after successes or errors (during success or error feedback). Stimulus presentation after errors increased overall learning rate, global consistency, and local consistency; after successes, it had no effect. Results suggest that memory for the stimulus seems crucial to the revision of hypotheses after errors.—*Journal abstract*.

1863. Hermann, Douglas J.; McLaughlin, John P. & Nelson, Billie C. (Hamilton Coll) **Visual and semantic factors in recognition from long-term memory.** *Memory & Cognition*, 1975(Jul), Vol 3(4), 381-384.—In recognition tests, physical and semantic relationships between targets and distractors have been shown, in separate manipulations, to affect the latency of S's decision. The present experiment tested the recognition of 16 undergraduates for distractors which were visually similar or dissimilar to targets and which belonged to the target categories or to nontarget categories in order to examine the interaction of these dimensions. Rejection latency was longer for target category than for nontarget category distractors. Latency was also longer for visually similar than visually dissimilar distractors, but only when combined with target category probes. This interaction can be explained by the hypothesis that word recognition depends on the analysis of several dimensions of the probe stimulus, and rejection can occur before all such analyses have been completed.—*Journal abstract*.

1864. Honeck, Richard P.; Riechmann, Paul & Hoffman, Robert R. (U Cincinnati) **Semantic memory for metaphor: The conceptual base hypothesis.** *Memory & Cognition*, 1975(Jul), Vol 3(4), 409-415.—Examined

the idea that people can encode and use an extremely abstract and general form of a complex linguistic (proverb) input. In Exp I, with 32 undergraduates, each proverb was accompanied by either a conceptually related (good, mediocre, or poor) or an unrelated interpretation. The related interpretations were more effective recall prompts than were the unrelated, but only for high-imagery proverbs. In Exp II 20 Ss wrote interpretations of the proverbs and then received either the proverb subject-noun or a brief story as a prompt. As was the case for the interpretations in Exp I, the stories did not share any major vocabulary or propositional structure with their proverb source. Nonetheless, the stories were as effective as the nouns. Also, quality of proverb interpretation and of recall performance were positively related, with the correlations involving low-imagery proverbs, and stories, tending to be higher. Both experiments support the conceptual-base notion and underline the importance of interpretive context. (21 ref)—*Journal abstract*.

1865. Kimmel, H. D. (U South Florida) **Instrumental conditioning of autonomically mediated responses in human beings.** *American Psychologist*, 1974(May), Vol 29(5), 325-335.—Reviews foundations of the belief that autonomically mediated responses are not instrumentally modifiable in the work of Jerzy Konorski, Stefan Miller, and Skinner. Later research confirming the conditionability of the human galvanic skin response is cited, along with confirmation of the reliability of instrumental heart rate conditioning. Implications for basic conditioning theory and for the treatment of psychosomatic disorders are noted. A revision of the traditional categories of conditioning is suggested. (74 ref)—R. Tomasko.

1866. Klinger, Nancy N. (Pennsylvania State U) **Hierarchical organization and memory.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1132-1133.

1867. MacLeod, Colin M. (U Washington, Seattle) **Release from proactive interference: Insufficiency of an attentional account.** *American Journal of Psychology*, 1975(Sep), Vol 88(3), 459-465.—The attentional hypothesis claims that the release from proactive interference is due to increased processing when Ss perceive a change in the items to be remembered. The present study manipulated attention by inserting a color cue before the final trial of a sequence in a paradigm used to study release from proactive interference developed by D. D. Wickens et al (1963). 192 undergraduates served as Ss. Relative to the corresponding conditions with no such cue, the cue affected performance neither when a category shift (release) nor when no category shift (control) was involved. Results disconfirm the prediction made by the attentional hypothesis.—*Journal abstract*.

1868. Marteniuk, R. G. & Diewert, G. L. (U Waterloo, Canada) **Decay and interference effects in motor short-term memory.** *Acta Psychologica*, 1975(Jun), Vol 39(3), 217-223.—Investigated trace decay and interference effects in motor short-term memory by contrasting the predictions of 2 recent models, one proposed by R. L. Pepper and L. M. Herman (see PA, Vol 44:4545) and the other by G. J. Laabs (see PA, Vol 51:10455) in regard to these 2 variables. Ss were 48 undergraduates. Laabs' prediction that forgetting in motor short-term memory is

indexed by greater variability of reproduction was supported in that movement reproduction after a 20-sec retention interval, either filled or unfilled, produced greater variable error. His model was again supported in that analysis of constant error over 5 movement extents indicated interference effects through formation of an adaptation level which caused short movements to be overshoot and long movements to be undershoot. Pepper and Herman's concept of spontaneous trace decay indexed by a negative shift in constant error was not supported as was their prediction that interpolated activity would alter the strength of the criterion trace through an assimilation process. Some evidence was found supporting the view that a memory trace can be strengthened through proprioceptive feedback entering through an unattended channel.—*Journal abstract.*

1869. McNally, Lawrence E. (Hofstra U) **Accommodation of conceptual tempo to methods of presentation in a free recall task.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1706.

1870. Misra, Girishwar & Srivastava, Km. Bindu. (U Gorakhpur, India) **Effects of verbal labelling on recognition of random shapes.** *Indian Journal of Applied Psychology*, 1974(Jan), Vol 11(1), 35-38.—Studied the recognition of random shapes under equivalence and distinctiveness training conditions using 3 types of labels (meaningful words, nonsense syllables, and 3-digit numbers). 60 undergraduate females performed J. M. Vanderplas and A. E. Garvin's (1959) recognition test. Results show that recognition was better after distinctiveness pretraining and that the number of correct recognitions was contingent upon the type of label used during pretraining.—*Journal abstract.*

1871. Mohan, Jitendra & Kumar, Ashok. (Guru Nanak U. Amritsar, India) **Task specificity and reminiscence.** *Indian Journal of Psychology*, 1973, Vol 48(4), 7-10.—Administered Eysenck's scale to 30 school girls to measure substitution, reverse alphabet writing, and figure writing. Reminiscence was found to be fairly task-specific.—*B. Roy.*

1872. Newman, Morris I. (Southern Illinois U) **Delay of information feedback and the retention of meaningful connected discourse.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1708.

1873. Newman, Slater E. (North Carolina State U) **The effects of isolation and articulation on response-term recall.** *American Journal of Psychology*, 1975(Sep), Vol 88(3), 483-487.—120 Ss were given 1 study trial on a paired associate list in which a response term for 1 of the pairs was isolated for half of the Ss; for the remaining Ss, none of the response terms was isolated. During the study trial, half the Ss in each treatment articulated all response terms; the rest articulated none. On the test of free recall of the response terms, the isolated response term occurred more often than its nonisolated counterpart, independent of whether it had been articulated. Response-term articulation facilitated response-term recall. It is suggested that (a) response-term isolation facilitates paired-associate learning by enhancing both response recall and associative learning and (b) response-term articulation also enhances response recall but interferes with associative learning. (19 ref)—*Journal abstract.*

1874. Nilsson, Lars-Göran; Wright, Edmund & Murdock, Bennet B. (U Uppsala, Sweden) **The effects of visual presentation method on single-trial free recall.** *Memory & Cognition*, 1975(Jul), Vol 3(4), 427-433.—In 2 experiments with a total of 64 undergraduate volunteers, 4 different conditions of visual presentation were studied with the purpose of furthering the understanding of the role of temporal and spatial factors underlying modality effects in single-trial free recall. Enriching spatial factors in the visual presentation did not produce a higher performance in the recency part of the serial-position curve, and it was therefore concluded that the modality effect could not be due to any visual handicap. A lag distribution measure was suggested and applied to the data to characterize output order (the order of recall) in single-trial free recall. The 2 experiments used a within-Ss and a between-Ss design, respectively, and illustrate the importance of the methodological difference between these 2 designs. (15 ref)—*Journal abstract.*

1875. Picek, James S.; Sherman, Steven J. & Shiffrin, Richard M. (Indiana U. Bloomington) **Cognitive organization and coding of social structures.** *Journal of Personality & Social Psychology*, 1975(Apr), Vol 31(4), 758-768.—In 2 experiments a total of 216 undergraduates read stories containing pairwise sentiment relationships among 4 people. The stories were either complete (all 6 relationships stated) or incomplete (only 4 relationships stated). When complete they were either balanced or imbalanced; when incomplete they were either balanceable or nonbalanceable. After reading 2 stories, Ss attempted to recall whether each relationship had been presented, and if so which sentiment was involved. Generally, Ss recalled balanced stories better. However, Ss sometimes recalled pairwise sentiments not stated in the (incomplete) stories. For balanceable stories, those misrecalls balanced triads containing them; for nonbalanceable stories, they imbalanced triads containing them. The data support an encoding model for the storage of social information rather than a model positing a generalized drift toward balance. (17 ref)—*Journal abstract.*

1876. Pomm, Hermann P. **[A model for an information-psychological concept of memory.]** (Germ) *Psychologische Beiträge*, 1974, Vol 16(4), 549-553. Proposes a model of memory as a currently undetermined, limited number of discrete storage levels in which information is linearly stored. A double logarithmic dependence is shown to exist between the intake of information, involving several storage levels, and respective storage times. A similar dependence is observed between forgetting time and the amount of information that can be remembered. 3 classical investigations appear to confirm the model. (French summary)—*Journal summary.*

1877. Psotka, Joseph. (U Waterloo, Canada) **Simplicity, symmetry, and syntely: Stimulus measures of binary pattern structure.** *Memory & Cognition*, 1975(Jul), Vol 3(4), 434-444. Elaborates a simple parameter-free algorithm based solely on the sequential run and alternation structure of binary sequences. The algorithm measures the sequence's syntely, the degree to which past consequences within a sequence converge on the continuation of that sequence's terminal run. Results of 3

experiments with a total of 126 undergraduates show that the algorithm predicted Ss' expectancies in a sequential prediction task using short binary sequences. Other algorithms measuring the symmetry and simplicity of short binary patterns are demonstrated, and their measures shown to be correlated with each other, but not correlated with syntely. The syntely algorithm was successful in predicting the error profiles of Ss learning short recurrent patterns of binary sequences. The success of the syntely algorithm, even though it may embody the principle of induction only imperfectly, provides good evidence that this principle is a useful normative guide for understanding the human processing of contingencies in binary sequences, making complicated schemes of rules and hypotheses unnecessary. (33 ref)—*Journal abstract*.

1878. Rabenou, Bijan & Kanak, N. Jack. (U Oklahoma) **Learning to learn and interitem associations in verbal-discrimination learning.** *American Journal of Psychology*, 1975(Sep), Vol 88(3), 467-473.—72 undergraduates learned 4 lists under Condition AR (interitem associations among the right items of each list), Condition AW (interitem associations among the wrong items), or Condition C (no associations), the 1st and 4th lists being run to a criterion of 2 successive errorless trials and the 2nd and 3rd lists for 5 trials. Results fail to support either frequency theory or the hypothesis that Ss learn higher-order approach or avoidance strategies with the presentation of successive, functionally equivalent lists. There was significant learning to learn in all conditions, but no main effect of condition and no interaction of condition by list (i.e., 1st, 2nd, 3rd, or 4th) on a measure of errors over 5 trials. (15 ref)—*Journal abstract*.

1879. Rowe, Edward J. (Memorial U Newfoundland, Saint John's, Canada) **The effect of imagery on rehearsal strategies in verbal-discrimination learning.** *American Journal of Psychology*, 1975(Sep), Vol 88(3), 431-442.—Measured Ss' rehearsal strategies in learning a 32-pair mixed list of high- and low-imagery pairs of nouns during the 4 study trials in an alternating study-test presentation. In Exp I, 20 undergraduates were asked to press 1 or 2 buttons to indicate their attention to right and wrong intrapair items; in Exp II, 20 Ss gave their rehearsals aloud; in Exp III, 40 Ss pressed buttons to indicate covert rehearsals. Substantially more rehearsals were given to right than to wrong items, but this difference was not affected by the imagery of pairs, even though high-imagery pairs were consistently easier to learn. Exp IV, with 20 Ss, suggested that a rehearsal strategy is used more for low-imagery pairs and an imagery strategy is used more for high-imagery pairs. Results suggest that the effect of imagery in verbal-discrimination learning is not readily explained in terms of differential rehearsal processes as was suggested in a study by W. P. Wallace et al (see PA, Vol 51:10416).—*Journal abstract*.

1880. Santa, John L. & Baker, Linda. (Rutgers State U, Douglas Coll) **Linguistic influences on visual memory.** *Memory & Cognition*, 1975(Jul), Vol 3(4), 445-450. The Whorf-Sapir (Whorfian) hypothesis has raised considerable controversy in the literatures of psychology and anthropology. Several misconceptions of the hypothesis are reviewed. In the present experiment with 37

undergraduates, the hypothesis was tested and supported in a visual reproduction paradigm. Ss were first given label training for a set of figures and were then asked to recall by drawing the shapes. Training with categorized labels resulted in a 25% improvement in recall when compared to a condition with nonword (paralog) labels. Even stronger evidence of linguistic influence on visual memory was obtained by examining the order of recall. The conceptual relationships among labels strongly influenced the sequence of reproductions. (20 ref)—*Journal abstract*.

1881. Saxena, A. K. & Tewari, R. K. (U Gorakhpur, India) **Role of semantic and conceptual similarity on retroactive interference.** *Indian Journal of Applied Psychology*, 1974(Jul), Vol 11(2), 60-63.—Studied retroactive interference when stimulus members in paired-associate learning were identical and response terms were varied. It was hypothesized that the effect of semantically similar interpolated learning or retroactive interference would be greater than the effect of conceptually similar interpolated learning. A memory drum apparatus was used with 60 undergraduates. Results show no significant differences between semantic and conceptual similarity.—*Journal abstract*.

1882. Schwartz, Marian. (U Wisconsin, Madison) **The effect of constant vs. varied encoding and massed vs. distributed presentations on recall of paired associates.** *Memory & Cognition*, 1975(Jul), Vol 3(4), 390-394.—The variables of coding (constant vs varied) and spacing (massed vs distributed) were factorially combined in an independent-groups design with 96 undergraduates. 16 nominal pairs were presented twice, with the 2 presentations being either massed or distributed. A given nominal pair (e.g., AR-LE) was accompanied either by the same word-pair code on both presentations (e.g., arm-leg) or by a different code on each presentation (e.g., arm-leg; arrive-leave). On a subsequent recall test, the nominal stimulus only was shown. Better recall of the nominal response was found after constant coding and after distributed presentations, and there was no interaction between the spacing and coding variables. Results (a) support none of the current proposed explanations for the distributed practice effect and (b) suggest that the critical factor in determining the probability of response recall is the strength of the strongest potential route to the response, not the number of different routes. (15 ref)—*Journal abstract*.

1883. Singh, B. N. & Thakur, R. C. (U Bihar, Langat Singh Coll, Muzaffarpur, India) **Effect of KR on verbal learning as a function of the learning task and the method of learning.** *Indian Journal of Applied Psychology*, 1974(Jan), Vol 11(1), 28-31.—Conducted an experiment with 40 male college students which involved 3 independent variables (knowledge of results, learning task, and learning method) during the performance of 2 verbal learning tasks (3-letter nonsense syllables and 3-digit figures) under 8 different experimental conditions. Analysis of variance showed that the effects of knowledge of results, learning task, and learning method on verbal learning were independent of each other.—*Journal abstract*.

1884. Solso, Robert L. & Biersdorff, Kathleen K. (Loyola U, Chicago) **Recall under conditions of cumulative**

cues. *Journal of General Psychology*, 1975 (Oct), Vol 93(2), 233-246.—In 2 experiments with a total of 318 university students, recall of common words was examined under 3 types of cues: initial letter, rhyme, and associative cues. After initial exposure to a list of to-be-remembered words, each cue was presented to 3 independent groups in a recall task. Then all possible combinations of 2 cues were given to Ss, followed by all 3 cues. In Exp I, Ss were immediately prompted after exposure to the target words, while in Exp II, Ss were given the opportunity to free recall target words before being prompted. Recall was greatly facilitated under multiple cuing conditions. It was postulated that prompted recall consists of priming implicit associative responses and matching these responses with items in memory. Multiple cuing restricts the number of generated responses which serve as the basis for search and match of immediate memory. (18 ref)—*Journal abstract*.

1885. Sommerkamp, Thomas R. (U Missouri, Columbia) **Transfer of training as a function of ability.** *Dissertation Abstracts International*, 1973 (Sep), Vol 34(3-A), 1140-1141.

1886. Tzeng, Ovid J. (U California, Riverside) **The effect of category size: Scanning or degree of learning?** *American Journal of Psychology*, 1975 (Sep), Vol 88(3), 443-453.—40 undergraduates learned 24 words from 2 categories to either a lenient or a stringent criterion and were then tested in an identification task. One category contained 16 words and the other contained 8 words. With the lenient criterion, category size had a negative effect on identification time; with the stringent criterion, it had a positive effect. The validity of scanning models that employ data on reaction time to support their proposals is questioned. It is concluded that a strength theory is better than any scanning model to accommodate the existing data. (16 ref)—*Journal abstract*.

1887. Uchida, Nobuko. [The effects of external and internal verbalization on memory and comprehension of a story in pre-school children.] (Japn) *Japanese Journal of Educational Psychology*, 1975 (Jun), Vol 23(2), 87-96.—Tested 3 hypotheses: (a) External verbalization facilitates learning formal aspects of sentences. (b) Internal verbalization facilitates learning semantic aspects of sentences. (c) Verbalization, either external or internal, enhances pilot comprehension. 2 experimental groups and 1 control group of 51 5-yr-old Ss each were exposed to the 3 different experimental conditions in which a story was presented 3 times with different instructions. Memory of the story was tested and analyzed. Results support the hypotheses. (English summary)—*S. Choe*.

1888. Underwood, Benton J. & Reichardt, Charles S. (Northwestern U) **Implicit associational responses produced by words in pairs of unrelated words.** *Memory & Cognition*, 1975 (Jul), Vol 3(4), 405-408. Conducted a study with 160 undergraduates to determine if implicit associational responses (IARs) occur to individual words presented as pairs for associative learning. The occurrence of IARs was determined by a "yes-no" recognition test, and IARs for words presented singly for study provided a baseline. For all conditions, false recognitions to assumed IARs occurred, the magnitude was equivalent for words presented for study as pairs, as for the same words presented singly. No evidence was found

that IARs occurred during the testing phase.—*Journal abstract*.

1889. Walker, Zlmarian S. (U Massachusetts) **The interactive effects of eye movement patterns with modes of stimulus presentation on the recall of paired-associate learning sequences.** *Dissertation Abstracts International*, 1973 (Oct), Vol 34(4-A), 1719-1720.

1890. Ward, L. Charles & Maisto, Albert A. (Murray State U) **A comparison of anticipation and recall procedures in serial learning.** *Journal of General Psychology*, 1975 (Oct), Vol 93(2), 207-212.—20 psychology students learned 2 serial lists, 1 by serial anticipation and 1 by serial-recall. Standard serial learning procedures were modified in order to equate the 2 methods for time per trial. Faster learning in terms of trials-to-criterion was observed under serial-recall. In addition, the shapes of the serial-position curves differed for the 2 methods. The standard bow-shaped curve was obtained for serial-anticipation. The curve for serial-recall was similar but with significantly more errors occurring at the last 3 serial positions.—*Journal abstract*.

1891. Warshaw, Susan C. (Columbia U) **Intelligence and children's recall for paired-associate materials.** *Dissertation Abstracts International*, 1973 (Nov), Vol 34(5-A), 2404.

1892. Wilson, Margaret P. (U Minnesota) **Individual differences and instructional variables in the acquisition of structure.** *Dissertation Abstracts International*, 1973 (Nov), Vol 34(5-A), 2405.

1893. Wittrock, M. C. & Carter, John F. (U California, Los Angeles) **Generative processing of hierarchically organized words.** *American Journal of Psychology*, 1975 (Sep), Vol 88(3), 489-501.—90 individually run undergraduates learned and were tested for their free recall of a conceptually unrelated hierarchy of words, a randomly arranged, or a properly arranged, conceptual hierarchy, under instructions to process the words either by generating hierarchical associations among them or by copying them. As predicted, recall of every type of hierarchy increased markedly with generative instructions, with the greatest gain occurring for the randomly arranged hierarchy. Type of hierarchy also affected recall. Results tend to support the generative model of encoding, a model which emphasizes the active construction of distinctive as well as semantic associations. (16 ref)—*Journal abstract*.

Motivation & Emotion

1894. Kruglanski, Arie W. et al. (U North Carolina, Chapel Hill) **Can money enhance intrinsic motivation? A test of the content-consequence hypothesis.** *Journal of Personality & Social Psychology*, 1978 (Apr), Vol 36(4), 744-750.—Presents 2 conceptual replications of an experiment designed to test the hypothesis that when monetary payments are inherent to the task's content their presence (vs absence) increases intrinsic motivation, whereas when they constitute the task's consequence their presence (vs absence) decreases intrinsic motivation toward the task. Ss were a total of 128 male 14-16 yr olds. Data of both experiments strongly support the hypothesis. The findings are consistent with the assumption that intrinsic motivation ensues whenever the actor causally attributes his per-

formance of the task to the task's content and are inconsistent with the proposal that intrinsic motivation be identified with internal (or self-) attributions and extrinsic motivation with attributions to the external environment.—*Journal abstract.*

1895. Narayanan, S. & Natarajan, P. (U Madras, Chepauk, India) **Questionnaire defined drive levels and performance in simple discriminative and choice reaction tasks.** *Indian Journal of Applied Psychology*, 1974(Jul), Vol 11(2), 47-50.—Studied the effect of anxiety on performance. 100 14-16 yr old males were given Taylor's Manifest Anxiety Scale and were measured using a reaction time apparatus. Results suggest that the questionnaire manipulation of the drive variable is not an effective way to affect K. W. Spence's (1958) levels of drive.—*R. Tomasko.*

Attention & Consciousness States

1896. Briggs, Gary G. (Duke U, Medical Ctr) **A comparison of attentional and control shift models of the performance of concurrent tasks.** *Acta Psychologica*, 1975(Jun), Vol 39(3), 183-192.—Superimposed a concurrent verbal task upon the performance of a practiced bimanual motor skill by 8 male and 8 female right-handed Ss. Addition of the verbal task did not increase the total number of errors; however, a significant $\text{ands} \times \text{Condition}$ interaction was observed. The right hand made significantly more errors under the verbal condition, while the left hand made nonsignificantly fewer errors under that condition. Findings support an attentional model rather than a model which proposes that addition of the verbal task causes control of the right hand to shift to the nonverbal right hemisphere. (15 ref)—*Journal abstract.*

1897. Knox, V. Jane; Crutchfield, Lila & Hilgard, Ernest R. (Queen's U, Kingston, Canada) **The nature of task interference in hypnotic dissociation: An investigation of hypnotic behavior.** *International Journal of Clinical & Experimental Hypnosis*, 1975(Oct), Vol 23(4), 305-323.—Ss were 15 highly hypnotizable college students (determined from scores on the Harvard Group Scale of Hypnotic Susceptibility, Form A) capable of performing a manual task (keypressing according to a simple pattern) following a posthypnotic signal, with the task out of awareness ("subconscious"). The subconscious task was sometimes performed alone, while S was presumably resting, and sometimes simultaneously with color naming, always "conscious." Control conditions included conscious keypressing, both alone and simultaneous with color naming. Most of the effects were in errors in keypressing beyond those in the conscious condition alone: when conscious pressing was attempted simultaneously with color naming; equally when subconscious keypressing was performed alone; by a greater amount when performed subconsciously with color naming. It is concluded that maintaining dissociation apparently requires cognitive effort, hence adding to task interference. Individual differences were noted in departures from the average findings, with no evidence for performances in any Ss improved substantially by hypnotic dissociation. (German, French, & Spanish summaries)—*Journal abstract.*

1898. Lewis, Marc; Honeck, Richard P. & Fishbein, Harold. (Case Western Reserve U) **Does shadowing differentially unlock attention?** *American Journal of Psychology*, 1975(Sep), Vol 88(3), 455-458.—Tested the assumption that auditory attention is locked onto a shadowed (verbally tracked) message. In a dichotic listening task, 40 undergraduates showed a general decrease in ability to attend to the content of the shadowed message. Results indicate that shadowing unlocks (rather than locks) attention.—*Journal abstract.*

1899. Ruch, John C. (Mills Coll) **Self-hypnosis: The result of heterohypnosis or vice versa?** *International Journal of Clinical & Experimental Hypnosis*, 1975(Oct), Vol 23(4), 282-304.—Developed quantitative measures of self-hypnosis and used them with 88 undergraduates to investigate how effective self-hypnosis is, both without initial training and following heterohypnosis. Ss first received group adaptations of the Harvard Group Scale of Hypnotic Susceptibility, Form A (HGSHS:A), and the Stanford Hypnotic Susceptibility Scale, Form C (SHSS:C); the "conventional" group received the usual standardized inductions, the "1st-person" group received rephrased inductions, and the "self-instructed" group supplied their own inductions. All Ss then received a self-instructed SHSS:C and a conventional HGSHS:A. The self-instructed scales yielded entirely satisfactory measurements, both objective and subjective. Untrained self-hypnosis was as effective as heterohypnosis. Conventional heterohypnosis inhibited later self-hypnosis, but 1st-person versions did not. Initial self-hypnosis facilitated later heterohypnosis. Findings contradict a stereotype of hypnosis based on heterohypnosis of a passive S by an active hypnotist, with self-hypnosis a derivative of this. They suggest instead a reconceptualization in which active self-hypnosis is the primary phenomenon, heterohypnosis is in effect guided self-hypnosis, and a hypnotist is as capable of being inhibitory as helpful. (German, French, & Spanish summaries) (30 ref)—*Journal abstract.*

1900. Shainberg, David. **On the role of knowledge.** *Contemporary Psychoanalysis*, 1975(Jul), Vol 11(3), 311-319.—Distinguishes the concepts of knowledge, needing to know, and knowing, and illustrates the transformations (physical, mental, and emotional) from one to another as they take place during long distance running.

1901. Tart, Charles T. & Fadiman, James. (U California, Davis) **The case of the yellow wheat field: A dream-state explanation of a broadcast telepathic dream.** *Psychoanalytic Review*, 1974-1975(Win), Vol 61(4), 607-618.—Describes an unusual case of the telepathic influence of one man's emotion on the dreams of at least one other man. Possible reasons for its occurrence are explored. Besides the 1st man's intense emotion, telepathic echoes in the 2nd man's dream may have been created by factors of suppressed emotion and atmospheric conditions. On the basis of the factors and incidents discussed, an experiment is suggested involving hypnosis and hypnotically trained Ss. It is felt that the experimental design described would lead to a high degree of telepathic success.—*G. S. Speer.*

EXPERIMENTAL PSYCHOLOGY (ANIMAL)

1902. Bernstein, Irwin S. (U. Georgia) Activity patterns in a gelada monkey group. *Primates*, 1975, Vol 23(1-2), 105-112. —Studied 56 cases of urination on hands or feet during 270 hrs of field observation of 6 troops ($n = 109$) of howler monkeys. Both sexes and all age classes showed urine-rubbing, adults (especially males) more often than immatures. Urine-rubbing was often associated with troop movement or stress. Possible functions discussed are troop identification, elicitation of aggression, communication of estrus, temperature regulation, and insect repulsion. (23 ref)—W. K. Redican.
1903. Chivers, D. J.; Raemackers, J. J. & Aldrich-Blake, F. P. (U Cambridge, England) Long-term observations of siamang behaviour. *Folia Primatologica*, 1975, Vol 23(1-2), 1-49.—Investigated behavior of feral *Symphalangus syndactylus* apes. Daily activity cycles, vocalizations, and ecology are discussed. (37 ref)
1904. Heymer, Armin. (Lab d'Ecologie Générale, Biologie, France) [The phylogenetic importance of the behavior of *Epallage fatime* Charp: 1840.] (Germ) *Zeitschrift für Tierpsychologie*, 1975(Mar), Vol 37(2), 161-83. Describes the behavior of this dragonfly (including a short ethogram) and compares it with other species of dragonflies as an approach toward an understanding of the phylogeny of *E. fatime* (English & French summaries) (21 ref)—P. Capretta.
1905. Kenya, V. M. (Lomonosov State U, Moscow, USSR) [Physiological analysis of intra-species interrelations of monkeys.] (Russ) *Zhurnal Vysshei Nervnoi Deyatelnosti*, 1975(Jan-Feb), Vol 24(1), 111-115. Studied the formation of complex chain reflexes between 2 monkeys when one was performing a food attainment behavior by pressing a lever while the other S, in an adjoining cage was receiving reinforcement. Experiments were made in 3 pairs of Ss placed in 2 adjoining cages. Results show that monkeys pressed on the lever when their mate did not receive any reinforcement or when it was not present in the adjoining cage. The nature of the observed relationships is discussed in terms of physiological mechanisms involving complex chain reflexes. (English summary) (28 ref)—L. V. Majovski.
1906. Kuhl, Patricia K. & Miller, James D. (Central Inst for the Deaf, St Louis, MO) Speech perception by the chinchilla: Voiced-voiceless distinction in alveolar plosive consonants. *Science*, 1975(Oct), Vol 190(4209), 69-72.
1907. Mason, William A. (U California, Davis) Comparative studies of social behavior in *Callicebus* and *Saimiri*: Strength and specificity of attraction between male-female cagemates. *Folia Primatologica*, 1975, Vol 23(1-2), 113-123.—Compared strength and specificity of attraction between males and females of 10 pairs each of titi (*Callicebus*) and squirrel (*Saimiri*) monkeys. Paired-comparison and single-stimulus tests showed stronger and more specific attractions in titi monkeys. Sex differences were evident only in squirrel monkeys; females were more strongly attracted to strangers than were males, and they preferred female strangers to either male strangers or male cagemates. —W. K. Redican.

(New York U) Urine-rubbing behavior in the mantled howler monkey *Alouatta palliata*. *Folia Primatologica*, 1975, Vol 23(1-2), 105-112. —Studied 56 cases of urination on hands or feet during 270 hrs of field observation of 6 troops ($n = 109$) of howler monkeys. Both sexes and all age classes showed urine-rubbing, adults (especially males) more often than immatures. Urine-rubbing was often associated with troop movement or stress. Possible functions discussed are troop identification, elicitation of aggression, communication of estrus, temperature regulation, and insect repulsion. (23 ref)—W. K. Redican.
1910. Schleidt, Wolfgang M. (U Maryland) How fixed is the fixed action pattern? *Zeitschrift für Tierpsychologie*, 1974, Vol 36, 184-211.—The fixedness or stereotypy of fixed action pattern (FAP) has become the most important diagnostic criterion of such behavior. 3 kinds of stereotypy are distinguished: (a) the degree of completeness with which constituent elements of the pattern are present, (b) the degree of coupling between those elements in their concurrence or succession, and (c) the degree of variability of the various physical characteristics of the patterns as a whole, or of its constituents. Various methods of measuring stereotypy are described, all involving some estimate of intra- and/or interindividual variability. As a strategy for future research on such elementary processes it is proposed that more attention be given to quantitative measurements of stereotypy and that the concept of FAP not be abandoned on the grounds that the term is incompatible with the notion of variability. (German summary) (2 p ref)—P. Capretta.
1911. Schuler, Werner. (U Göttingen, Zoologisches Inst und Museum, W Germany) [The influence of the resemblance between mimic and model and of alternate prey upon the effectiveness of artificial Batesian mimicry.] (Germ) *Zeitschrift für Tierpsychologie*, 1974, Vol 36, 71-127.—The response of caged starlings to artificial Batesian models and mimics was investigated by means of an automated feeding device. Birds were first taught to accept painted and unpainted palatable mealworm pupae; then they learned to avoid painted unpalatable models in addition to identically painted mimics. Among the conclusions, it is stated that under normal conditions (i.e., when palatable alternate prey is abundant) even rather imperfect mimics will be well protected since starlings probably do not discriminate as precisely as they are able to do. However, if only unpalatable prey, or very little acceptable alternate prey is available, the birds will probably discriminate accurately between model and mimic, greatly reducing the protection afforded to the latter. 1913. Wehner, R. & Horn, E. (Zürich, Zoologisches Inst., Switzerland) The effect of object distance on pattern preference in the walking fly *Drosophila melanogaster*. *Journal of Experimental Psychology*, 1973, Vol 81(1), 1-11.

1914. Zablocka, Teresa. (Nencki Inst. of Experimental Biology, Warsaw, Poland) Go no go differentiation to visual stimuli in cats with different early visual experiences. *Acta Neurobiologica Experimentalis*, 1975, Vol 35(4), 389-398. —Ss were hooded since birth and 7 unhooded control Ss in a play box during 2 experiments. Results indicate that in Ss deprived of pattern vision, go-no-go differentiation was seriously impaired. This suggests that the impairment of simultaneous object discrimination cannot be explained as a result of a deficit in the spatial orientation of hood-reared Ss. —*Journal abstract*

1915. Zablocka, Teresa, Nomorski, Jerry & Zernicki, Buguslaw. (Nencki Inst. of Experimental Biology, Warsaw, Poland) Visual discrimination learning in cats with different early visual experiences. *Acta Neurobiologica Experimentalis*, 1975, Vol 35(4), 389-398. —In an experiment with 18 control and 23 hood-reared experimental cats, simultaneous object discrimination learning in an alimentary situation was strongly impaired in Ss deprived from birth of patterned visual experience. The same impairment was observed in Ss with experience limited to those objects that were used later in the discrimination task. Some impairment was also present in Ss which were reared with opened eyes in the laboratory as compared with normal Ss that spent the early period of life outside of the laboratory. It is concluded that the deprived Ss were impaired mostly because of the lack of opportunity during early development to use visual cues in alimentary tasks. —*Journal abstract*

Learning & Motivation

1916. Bilbrey, John & Winokur, Stephen. (Texas Christian U.) Conditioned reinforcement: Effects of temporal contingency and percentage of pairing. *Journal of General Psychology*, 1975(Oct), Vol 93(2), 247-260. —Conducted 5 experiments with 3 King pigeons. Exp I investigated the effects of noncontingent unconditioned reinforcement and the effects of noncontingent pairing of a neutral stimulus and food on the establishment of a conditioned reinforcer for pigeons. Results indicate that a temporal contingency between a neutral stimulus and a food reinforcer was necessary to establish that stimulus as a conditioned reinforcer. Exp II examined the effects of making food response-contingent while concurrently presenting a noncontingent neutral stimulus. Data indicate that a temporal contingency between the stimulus and food was a necessary condition to establish that stimulus as a conditioned reinforcer. Exps III-V investigated the effects of varying the frequency of pairing a neutral stimulus and food on the maintenance of the stimulus as a conditioned reinforcer. As the percentage of pairings decreased from 100 to 10%, responding for response-contingent conditioned reinforcement increased, while responding for a stimulus which was not previously contingently paired with food remained near zero. (22 ref)—*Journal abstract*.

1917. Chumova, Arnold S. (Stirling U., Scotland) Failure to find rhesus observational learning. *Journal of Experimental Psychology*, 1974, Vol 82(1), 39-41.

1918. Dobrzeczka, Czeslawa. (Nencki Inst. of Experimental Biology, Warsaw, Poland) The effect of postural reflexes on the acquisition of the left foreleg right foreleg differentiation in dogs. *Acta Neurobiologica Experimentalis*, 1975, Vol 35(4), 361-367. —Trained a group of 3 dogs to perform a placing movement of the right or left foreleg on a platform. The Ss learned to discriminate between the ipsilateral hindlimbs. The Ss learned this task with difficulty. In another group of 4 Ss the method of crossed reflexes was applied. As a correct response to the right tactile stimulus, the movement of the left foreleg was required, and vice versa. This task was solved rapidly. It is suggested that this was due to the facilitatory effect of the Sherringtonian postural reflexes. —*Journal abstract*

1919. Ishida, Masato. (Hiroshima U., Japan) [Resistance to extinction of the partial delay of reward concerning the few-trial PRE.] (Japn) *Journal of Animal Psychology*, 1975(Mar), Vol 24(2), 63-71. —Studied the partial reinforcement effect (PRE) in the rat. 44 Ss learned to approach food in a runway for 5 or 48 trials, of which 3 or 24 trials were immediately reinforced, but the remaining 2 or 24 trials were reinforced either immediately, after 5 sec, after 44 sec, or not at all. During the subsequent extinction trials, the continuous reinforcement group was extinguished promptly, whereas the partial reinforcement group maintained fast running, thus demonstrating that PRE occurs even when the number of training trials was small enough to make the frustration of nonreward insignificant. The partial-delayed reinforcement groups showed intermediate levels of resistance to extinction. The stimulus after-effect arising from a long delay of reinforcement is more similar to that arising from nonreward and more readily generalized in the extinction situation than that arising from a short delay. (English summary) (18 ref)—S. Nakajima.

1920. McCroskery, James H. (State University Coll New York, Oswego) Comparisons between discrimination and nondiscrimination training on resistance to extinction and stimulus control. *Journal of General Psychology*, 1975(Oct), Vol 93(2), 183-197. —Rats received either discrimination or simple instrumental nondiscrimination training in operant chambers with food reinforcement. In Exp I, 32 female Sprague-Dawley rats were given either 3 or 13 sessions of acquisition training, and in Exp II, 24 male Holtzman rats were given 6 sessions of acquisition training before being tested for resistance to extinction and stimulus control. In neither experiment was there a difference in number of responses during

extinction as a function of acquisition training, whereas in both experiments discrimination training produced an S+ response tendency which persisted through extinction. It is argued that with discrimination training, interactions between S+ and S- are limited to performance factors (e.g., behavioral contrast) and not conditioning factors (e.g., resistance to extinction).—*Journal abstract*.

1921. **Mitani, Keiichi.** (Okayama U, Japan) [Enhancement of general activity in the white rat through rearing in enriched environment.] (Japn) *Annual of Animal Psychology*, 1975(Mar), Vol 24(2), 73-85.—Studied the effects of the rearing environment on activity level of rats. 9 experimental males lived in a large pen with a number of objects for a period from the 25th to 110th postnatal days, while 6 littermate males (control group) and 12 females remained in group cages, 6 to a cage. The experimental Ss were smaller and more active in an open field than the controls. There was no significant difference in running wheel activity, or in urination and defecation. Results are in agreement with findings by others. (English summary) (36 ref)—S. Nakajima.

1922. **Pietrzykowska, Bozena & Soltysik, Stefan.** (Nencki Inst of Experimental Biology, Warsaw, Poland) A failure to train the "same-different" differentiation of photic stimuli in dogs. *Acta Neurobiologiae Experimentalis*, 1975, Vol 35(1), 27-38.—5 dogs were unable to learn "same-different" differentiation of pairs of photic stimuli when continuous light (CL) and pulsing light (PL) were presented in 4 combinations: CL-PL and PL-CL served as reinforced stimuli, whereas CL-CL and PL-PL were inhibitory stimuli. In Exp II, 4 dogs initially learned the differentiation task with tones, but were unable to transfer to photic stimuli. In Exp III, differentiation between CL and PL singly as reinforced and inhibitory stimuli was easily acquired by 4 dogs, showing that the stimuli were readily discriminable.—*Journal abstract*.

1923. **Pietrzykowska, Bozena & Soltysik, Stefan.** (Nencki Inst of Experimental Biology, Warsaw, Poland) Transfer of the "same-different" differentiation task in dogs. *Acta Neurobiologiae Experimentalis*, 1975, Vol 35(1), 39-50.—4 dogs, previously trained to perform a "same-different" differentiation with tones, transferred readily to the same task with new stimuli of the same (auditory) modality. The data are interpreted as support for a hypothetical mechanism involving correct performance based on "matching" the memory of a 1st stimulus with the perceptual image of the 2nd (within a pair) and using the feature of sameness and difference as the inhibitory stimulus and the positive stimulus respectively. The data did not confirm the notion of "conditioned switching." (17 ref)—*Journal summary*.

1924. **Schnur, Paul.** (Fordham U, Lincoln Ctr) The number of trials of compound conditioning: Its effect on latent inhibition in rats. *American Journal of Psychology*, 1975(Sep), Vol 88(3), 411-419. In 2 experiments with a total of 24 male albino Sprague-Dawley rats, nonreinforced tests for the strength of the preexposed and nonpreexposed elements of a compound CS were interspersed throughout conditioning. The nonreinforced exposures and the conditioning trials were superimposed on an appetitive operant baseline, and conditioned

suppression of the Ss' barpressing was the dependent variable. In both experiments, the preexposed element failed to suppress responding and failed to gain strength over trials. The nonpreexposed element at first suppressed responding completely but gradually lost control of responding, even while the compound continued to suppress responding asymptotically. Results are discussed in terms of loss of salience and discrimination hypotheses.—*Journal abstract*.

1925. **Yagi, Ben; Shinoda, Akira; Shinohara, Shoichi & Hirata, Akitsugu.** [Analysis of color-form cue problem in the Japanese monkey (*Macaca fuscata yakui*): I. Oddity problem.] (Japn) *Annual of Animal Psychology*, 1975(Mar), Vol 24(2), 87-98.—Studied the dominance of a stimulus dimension as a cue in solving oddity discrimination problems. 4 Ss were 10-13 yr old males and females, all with previous experience of discrimination learning. Training was to respond to 1 object which was different in both color and form from 2 other identical objects; testing was to choose 1 object out of 3, all of which were different in either color or form. In transfer tests with 3 objects, more correct responses were made when all objects were different in color but identical in form than when they were different in form but identical in color. The dominance of color in *Macaca fuscata* agrees with findings in other old-world monkeys. (English summary) (17 ref)—S. Nakajima.

Social & Instinctive Behavior

1926. **Bartoshuk, Linda M. et al.** (Yale U, John B. Pierce Foundation Lab) Taste rejection of nonnutritive sweeteners in cats. *Journal of Comparative & Physiological Psychology*, 1975(Oct), Vol 89(8), 971-975.—Cats reject saccharin and cyclamate and are indifferent to dulcin, although they, like other mammals, prefer sucrose. The rejection threshold for saccharin found for 10 cats in the present 2 experiments, 0.0001 M, was about 2 log steps lower than a previously reported rejection threshold for sodium saccharin. Water produced a taste in Ss adapted to their own saliva. The high sodium saccharin was masked by the taste of the water solvent; however, saccharin may also be somewhat more aversive to the cat than sodium saccharin. Saccharin may produce an aversive taste because it stimulates receptor sites sensitive to substances bitter to man as well as those sensitive to sugars. In addition, saccharin may not be an effective stimulus for all sugar-sensitive sites. (17 ref)—*Journal abstract*.

1927. **Bradbury, Jack W. & Emmons, Louise H.** (Rockefeller U, NY) Social organization of some Trinidad bats: I. Emballonuridae. *Zeitschrift für Tierpsychologie*, 1974, Vol 36, 137-183. Long-term observations on 3 species of neotropical emballonurid bats showed that (a) social units of *Saccoptery bilineata* were based on male dominated harems, each male actively defending a territory on the side of the roost (cavities of trees, or abandoned buildings) and performing elaborate vocal, visual, and presumably olfactory displays to attract and retain females; (b) social units of *S. leptura* were smaller (the most common unit being a male female pair) and the males did not defend territories at the roost (boles of forest trees); (c) a third sympatric species, *Rhynchonycteris naso*, appeared to be similar in behavior

to *S. leptura*, but formed much larger groups on the sides of cliffs or on trees along rivers. (German summary) (16 ref)—*P. Capretta*.

1928. Clutton-Brock, T. H. (U Sussex, Ethology & Neurophysiology Group, Brighton, England) Feeding behaviour of red colobus and black and white colobus in East Africa. *Folia Primatologica*, 1975, Vol 23(3), 165-207.—Compared feeding behavior of 204 red colobus (*Colobus badius tephrosceles*) and 37 black-and-white colobus (*C. guereza wellensis*) in forest habitats, and investigated the relationship between selection and availability of food. It is suggested that species differences in group size and range may be related to differences in dispersion of food. (40 ref)—*W. K. Redican*.

1929. Emlen, Stephen T. (Cornell U) The stellar-orientation system of a migratory bird. *Scientific American*, 1975(Aug), Vol 233(2), 102-111.—Describes several experiments which suggest that night-migrating birds develop a north-south reference axis as a result of early exposure to celestial rotation. Birds obtain redundant directional information from star patterns. The precise direction of migration depends on the hormonal and physiological state of the bird and not on seasonal differences in star positions.—*P. Tolin*.

1930. Floody, Owen R. & Arnold, Arthur P. (Bucknell U) Uganda kob (*Adenota kob thomasi*): Territoriality and the spatial distributions of sexual and agonistic behaviors at a territorial ground. *Zeitschrift für Tierpsychologie*, 1975(Mar), Vol 37(2), 192-212.—Studied aggressive and reproductive behaviors of this African antelope within its territorial ground (TG) in Ruwenzori National Park, Uganda. Male residents of a TG occupy exclusive areas, with agonistic behaviors occurring most frequently along territorial boundaries nearest areas of high sexual activity. Territoriality in kob seems to function primarily to control access of males to reproductively active females. Such control is most effective over short periods since several males perform nearly all matings at the TG. Over long periods, the rapid turnover of males in active territories, matings during brief territorial intrusions, and low rates of mating in inactive territories may result in a more uniform distribution of successful matings. (German summary)—*Journal summary*.

1931. Fricke, Hans W. (Max-Planck-Institut für Verhaltensphysiologie, Seewiesen, W Germany) [Eco-ethology of the anemone fish *Amphiprion bicinctus* (field studies in the Red Sea).] (Germ) *Zeitschrift für Tierpsychologie*, 1974, Vol 36, 429-512.—Presents a quantitative analysis of the ecology, biotope-oriented activities, social behavior and social organization of the monogamous anemone fish, with a discussion of the methodology of comparative eco-ethological adaptation research. (English summary) (2 p ref)—*P. Capretta*.

1932. Hendry, L. B. et al. (Pennsylvania State U) The oak leaf roller (*Archips semiferanus* Walker) sex pheromone complex: Field and laboratory evaluation of requisite behavioral stimuli. *Experientia*, 1975, Vol 31(6), 629-631.—Studied sexual behavior of the oak leaf roller (OLR) in an attempt to control reproduction of this tree-defoliating moth. Laboratory electroantennograms (EAGs) and field tests (forest traps) were

conducted to test responsivity to 21 acetate monomers identified in the attractant portion of female abdominal extracts. Poor correlations between field trapping and EAG pointed out the complex nature of sexual communication in the OLR. A mixture of several monomers may be necessary to influence sexual communication in this pest. (German summary)—*J. L. Andreassi*.

1933. Johnston, Robert E. (Cornell U) Scent marking by male golden hamsters (*Mesocricetus auratus*) III. Behavior in a seminatural environment. *Zeitschrift für Tierpsychologie*, 1975(Mar), Vol 37(2), 213-221.—Describes dominance relationships, food hoarding, and marking behavior which developed between 4 pairs of male hamsters housed for 2-3 wks in a compartmentalized Plexiglas cage. (German summary)—*P. Capretta*.

1934. Johnston, Robert E. (Cornell U) Scent marking by male golden hamsters (*Mesocricetus auratus*). I. Effects of odors and social encounters. *Zeitschrift für Tierpsychologie*, 1975(Feb), Vol 37(1), 75-98.—Tested scent or flank marking by male hamsters in different odorous environments and during and after encounters with other hamsters. Findings indicate that (a) males marked more in cages previously occupied by other hamsters than in identical clean cages; (b) males marked at lower rates in the cages of females on Days 1 and 2 of estrous than on Days 3 and 4; (c) when males were tested in the empty cages of estrous females their low rate of marking was reduced further by females, encounters with an estrous female before the test session (i.e., sexual motivation and marking are negatively correlated); (d) agonistic encounters between males and nonestrous females seem to stimulate marking by males; (e) marking is higher in dominant than in subordinate males; (f) marking usually occurs just after contact between 2 individuals; (g) marking occurs both in social (high frequency and intensity) and nonsocial (low frequency and intensity) encounters, the causes probably being different from situation to situation. (German summary) (2 p ref)—*Journal summary*.

1935. Joubert, S. C. (Kruger National Park, South Africa) The mating behaviour of the tsessebe (*Damaliscus lunatus lunatus*) in the Kruger National Park. *Zeitschrift für Tierpsychologie*, 1975(Mar), Vol 37(2), 182-191.—Describes typical sequences in the mating behavior of this African antelope, including the "nose and neck stretch" posture of the courtship display of the bull when approaching a cow, the role of olfactory stimuli which are derived from either smelling at the base of a cow's tail or from the ground where a cow had rested or urinated, the spontaneous ejaculation of the bull in response to such stimuli, and mounting. The dominance display ("nose forward-upward posture") and the courtship display are distinguished. Comparative notes on the mating behavior of congeneric species (i.e., the blesbok, bontebok, and topi) are also given, with a discussion of the conflicting interpretations of courtship display in these different species. (German summary)—*Journal summary*.

1936. Klingel, Hans. (Zoologisches Inst der Technischen U Braunschweig, W Germany) [Social organization and behavior of Grevy's zebra (*Equus grevyi*).] (Germ) *Zeitschrift für Tierpsychologie*, 1974, Vol 36, 37-70.—Observations of individually recognized zebra in Northern

Kenya revealed among other things that (a) adult stallions are territorial, territories being kept for years and their owners oriented to them by means of conspicuous permanent dung piles; (b) territorial stallions are dominant, while all other adults are equally low rank with subadults and foals below them; (c) when migrating, the groups are led by a passive leader who often gives way to any member who may induce the group to move; (d) individual recognition between mares and their foals seems to occur by smell and sight, and possibly by voice. A number of other behavior patterns are described: vocal communication, marking, grooming, play, fighting, mating, and resting. (English summary) (36 ref)—*P. Capretta*.

1937. Koeniger, N. & Fuchs, S. (Inst für Bienenkunde, Zoologisches Inst der Techn, Darmstadt, W Germany) [Colony defense in Asian honey bees.] (Germ) *Zeitschrift für Tierpsychologie*, 1975(Feb), Vol 37(1), 99-106.—Determined by analysis of film that *Apis cerana* colonies show defense behavior in response to the movements of a dark object before a light background (almost regardless of the object's shape). Various other mechanical and chemical stimuli did not release such behavior. Continued stimulation for 90 min reduced the number of responding bees by 80%. The colony's ability to discriminate between returning forager bees and other flying insects is discussed. (English summary)

1938. Krige, Penelope D. & Lucas, J. W. (U Natal, Durban, South Africa) **Aunting behaviour in an urban troop of *cercopithecus aethiops*.** *Journal of Behavioural Science*, 1974, Vol 2(2), 55-61.—During observations of a free-ranging troop cholinolytic 56 vervet monkeys, females other than the mother often handled the young infants and sometimes removed them from their mothers by force. These findings differ from other reports of aunt behavior by subadult female monkeys. The aunts in this study were mainly adult females, often with infants of self-stimulation own. Necessary changes to existing theories about the adaptive significance of aunting behavior are discussed. (16 ref)—*Journal abstract*.

1939. Lill, Alan. (Monash U, Clayton, Australia) **Sexual behavior of the lek-forming white-bearded manakin (*Manacus manacus trinitatis* Hartert).** *Zeitschrift für Tierpsychologie*, 1974, Vol 36, 1-36.—Describes the traditional mating forum, or lek, of this fruit-eating bird in Trinidad, West Indies, with emphasis on the determinants of its distribution, and the effect of mating outside the lek on the evolution of the lek. (German summary) (44 ref)—*P. Capretta*.

1940. Lill, Alan. (Monash U, Clayton, Australia) **Social organization and space utilization in the lek-forming white-bearded manakin, *M. manacus trinitatis* Hartert.** *Zeitschrift für Tierpsychologie*, 1974, Vol 36, 513-530.—Detailed observations of 2 mating forums, or leks, over 3 different breeding seasons (March through July) revealed that most males of this fruit-eating bird underwent a progression in social status at the lek with age from visitor to intruder to territorial resident. Some residents regressed to intruder status again in the months preceding death. Resident males occupied a restricted home range around their lek. Females tended to nest near the lek at which they mated in any given season but generally ranged more widely than males both within

and between seasons. Manakins are not gregarious away from the arena and social interactions at bathing and feeding sites where birds meet briefly probably do not exert a major influence on social relationships at the lek. (German summary) (25 ref)—*P. Capretta*.

1941. Luttenberger, Franz. (U Vienna, I. Zoologischen Institute, Austria) [On yawning in reptiles.] (Germ) *Zeitschrift für Tierpsychologie*, 1975(Mar), Vol 37(2), 113-137.—Field observations and laboratory experiments with various lizards and tortoises indicate that yawning increases in the presence of carbon dioxide, fatigue, and (probably) hunger. (English summary) (58 ref)—*P. Capretta*.

1942. Maple, Terry. (Emory U) **On the need for investigations of inter-species social behavior within the order of primates.** *Journal of Behavioural Science*, 1974, Vol 2(2), 63-66.—Presents results from a 60-day observation period during an ongoing, long-term investigation of the social behavior of an adult heterosexual baboon-macaque pair. Ss have developed a mutually understood vocal communication system, using sounds from each S's respective species. The female baboon has shown an active sexual interest in the male macaque which is not reciprocated. The male exhibits many female-like behaviors due to his subordinate role in the pair. Further long-term studies of intergenus infant pairs have been initiated. (15 ref)—*B. McLean*.

1943. Maple, Terry; Erwin, J. & Mitchell, G. (Emory U) **Separation of adult heterosexual pairs of rhesus monkeys: The effect of female cycle phase.** *Journal of Behavioural Science*, 1974, Vol 2(2), 81-86.—4 heterosexual pairs of adult monkeys were divided into 2 groups: those united at the onset of menstrual bleeding by the female member of the pair and those united on the day when ovulation was expected. Ss were observed during a 7-day period consisting of 3 distinct phases: preseparation (union), separation, and postseparation (reunion). Differences were observed according to the conditions of the females, with males showing different forms of affiliative behaviors depending on the condition of the female, and females showing greater interest in the ovulation condition.—*Journal abstract*.

1944. Maurus, M.; Kühlmorgen, B.; Hartmann-Wiesner, E. & Pruscha, H. (Max Planck Inst for Psychiatry, Munich, W Germany) **An approach to the interpretation of the communicative meaning of visual signals in agonistic behavior of squirrel monkeys.** *Folia Primatologica*, 1975, Vol 23(3), 208-226.—Visual agonistic signals of squirrel monkeys (*Saimiri sciureus*) were quantitatively divided into classes according to communicative meaning. The intensity and function of each class are discussed. (23 ref)—*W. K. Redican*.

1945. Platz, Franz. (U Friburg, Anatomisches Inst der Albert-Ludwigs, W Germany) [The ontogeny of social behavior patterns and the development of calls in the red-crested pochard (*Netta rufina* Pallas), with a contribution to the anatomy of the vocal apparatus.] (Germ) *Zeitschrift für Tierpsychologie*, 1974, Vol 36, 293-428.—Wild populations of ducks living on Lake of Constance as well as 23 hand-reared birds were observed with emphasis on the development of the greeting ceremony and the courtship display. It was found, for example, that from the 1st day after hatching until about

8-13 wks of age, both sexes greet parent and sibling companions with certain movements, accompanied by trilling vocalizations. In females, the orientation and meaning of such behavior begin to change at 8-15 wks into that used for choosing a potential mate or for appeasing aggressive males. The ontogeny of the Red-crested Pochard represents precursors of behavior patterns in adults. Results are discussed in relation to the probable evolutionary development of the behavior. (3% p ref) (English summary)—*P. Capretta*.

1946. Reese, Ernst S. (U Hawaii) A comparative field study of the social behavior and related ecology of reef fishes of the family Chaetodontidae. *Zeitschrift für Tierpsychologie*, 1975(Feb), Vol 37(1), 37-61.

1947. Rhine, Ramon J. (U California, Riverside) The order of movement of yellow baboons (*Papio cynocephalus*). *Folia Primatologica*, 1975, Vol 23(1-2), 72-104. —Studied the spatial organization of 32 feral baboons in Amboseli Reserve, Kenya, during troop movements. The protective function of troop structure is discussed. Spatial position by demographic class was similar to that previously found for 3 troops of anubis baboons in 2 different habitats. (39 ref)—*W. K. Redican*.

1948. Studer-Thiersch, Adelheid. (Max-Planck-Institut für Verhaltensphysiologie, Seewiesen, W Germany) [The courtship of the flamingo genus *Phoenicopterus*, especially of *Ph. ruber roseus*.] (Germ) *Zeitschrift für Tierpsychologie*, 1974, Vol 36, 212-266.—Examined various aspects of courtship behavior in several species of captive flamingoes and compared this to a free-living species (*roseus*) found in Spain. (English summary) (2 p ref)—*P. Capretta*.

1949. Tachibana, Toshiaki. (Waseda U, Tokyo, Japan) Social influence on eating behavior of albino rats in an approach-withdrawal situation: II. Effect of the presence of an anesthetized rat. *Annual of Animal Psychology*, 1975(Mar), Vol 24(2), 99-103.—Studied the factors affecting the enhancement of food intake in the presence of another animal. 29 female rats learned to eat from a food cup, and then received 6 trials of footshock. When tested individually, none of the Ss ingested any food. The presence of a demonstrator rat, which ate from the same food cup, facilitated food consumption in the shocked Ss. A lesser but significant degree of facilitation occurred when an anesthetized S was placed near the food cup, but not when it was placed at a distance from the cup. —*S. Nakajima*.

1950. Todt, D. (U Freiburg, Biologisches Inst (Zoologie), W Germany) Effect of territorial conditions on the maintenance of pair contact in duetting birds. *Experientia*, 1975, Vol 31(6), 648-649.—Studied the singing behavior of the central African thrush to determine to what extent similarity of song in a potential mate would cause that bird to be chosen for a partner, as a function of whether the potential mate was inside or outside the territorial area. Similarity of song pattern was a factor as long as the male was within the females' territorial area. However, similarity lost its effect in maintaining pair contact once the male with the more similar song was placed outside the female's territory; i.e., she chose the closer male regardless of whether this male's song was coordinated with her own pattern. (German summary) —*J. L. Andreassi*.

1951. Waser, Peter M. (Rockefeller U, New York, NY) Spatial associations and social interactions in a "solitary" ungulate: The bushback *Tragelaphus scriptus* (Pallas). *Zeitschrift für Tierpsychologie*, 1975(Feb), Vol 37(1), 24-36.—18 recognizable individuals in a population of bushback in Rwenzori National Park (Uganda), were followed between June 20 and July 30, 1971 (during the dry season), using census sightings and longitudinal observations. The latter confirm that most bushback spend most of their time alone, and that the most frequent associations are those between adult females and immatures (tending to be permanent and exclusive of others) and between adult males and females (short-lived and not exclusive). Male-male associations also occur along with more complex groupings. Little aggression was observed; home range overlap was considerable and no evidence of exclusive occupancy of space, even among males, was seen. A comparison between the length and frequency of initiation of actual associations vs those one might expect if the animals were moving randomly and independently does not support the hypothesis that bushback avoid each other. The definition of the "solitary" state is discussed in view of these findings. (German summary)—*Journal summary*.

1952. Wickler, Wolfgang. (Max-Planck-Institut für Verhaltensphysiologie, Seewiesen, W Germany) [Influence between partners in duetting songs of the robin chat (*Cossypha bengalensis* Hartlaub).] (Germ) *Zeitschrift für Tierpsychologie*, 1974, Vol 36, 128-136.—Examined influence that robin chat partners have on one another through changes in singing speed (females influence males but not vice versa) and singing motif (males can change the singing of females by singing a certain motif). (English summary)—*P. Capretta*.

PHYSIOLOGICAL PSYCHOLOGY

1953. Anisman, Hymie. (Carleton U, Ottawa, Canada) Task complexity as a factor in eliciting heterosis in mice: Aversively motivated behaviors. *Journal of Comparative & Physiological Psychology*, 1975(Oct), Vol 89(8), 976-984.—10 mice from each of 3 inbred strains (A/J, DBA/2J, and C57BL/6J) and their 6 reciprocal F₁ hybrids were tested in activity levels before and after shock, inhibitory avoidance, 1-way avoidance, and shuttle avoidance. In the activity and inhibitory situations the hybrids generally exhibited an intermediate pattern of inheritance. In the 1-way avoidance task complete dominance was the rule, whereas in the shuttle task overdominance was apparent in all the hybrid strains. Overdominance was more evident in tasks requiring increased versatility of associative processes. It is suggested that when the task involves relatively simple contingencies or reflexive behaviors, increased versatility is not necessary and consequently the hybrid advantage is not apparent. When the task involves integrative capacities, the hybrid advantage emerges. (25 ref) —*Journal abstract*.

1954. Caddy, K. W. & Biscoe, T. J. (U Bristol, Medical School, England) Preliminary observations on the cerebellum in the mutant mouse Lurcher. *Brain Research*, 1975, Vol 91(2), 276-280.—Investigated the

structural genetic defect in the cerebellum of the heterozygote Lurcher mouse in an attempt to relate the behavioral change to the structural lesion. The development of the lesion at various ages is described, and it is suggested that the widespread nature of the lesions may indicate a nonspecific lesion of either the vascular system or the astrocytes.

1955. Galambos, Robert. (U California, San Diego) **Anatomy, physiology and biochemistry of auditory processing.** *Acta Symbolica*, 1974, Vol 5(2), 19-35. —Discusses selected problems in auditory processing: hereditary deafness, cochlear biochemistry, central chemical events, electrical responses from the human brainstem, the efferent auditory system, and brain waves in attention and decision-making. (53 ref)—*M. Cynamon*.

1956. Gould, James L. (Rockefeller U, NY) **Genetics and molecular ethology.** *Zeitschrift für Tierpsychologie*, 1974, Vol 36, 267-292.—With regard to the genetic basis of behavior, 2 levels of analysis are being pursued in ethology: the first asks what aspects of behavior are genetically controlled (the answers have been traditionally sought through observation); the second asks how the genome expresses itself as behavior (this is accomplished by creating different mutations which block the same behavior, and then asking which step each mutant gene controls). The relevance of this latter approach to ethology lies in the expectation that behavior as a complex phenomenon appears out of the interactions of many basic processes, which are sufficiently simple in themselves for their genetic and biochemical details to be understood. (German summary) (3 p ref)—*P. Capretta*.

1957. Polikanina, R. I. & Urmancheyeva, T. G. (USSR Academy of Medical Sciences, Brain Inst. Moscow) **[Reaction to color stimuli in young rhesus monkeys.]** (Russ) *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1974 (Jan Feb), Vol 24(1), 147-156. Studied the effect of color stimuli presented to 5 young macaque, rhesus monkeys ranging in age from 3 mo 11 days to 7 and one-half mo in order to assess the ability of their color-sensitive eye apparatus to differentiate visual stimuli of differing frequencies. Rhythmical green and red flashes of equal latency and intensity were used to evoke different shifts in EEG and autonomic conditioned responses in the Ss. Results show that the direction of EEG and other parameters corresponded to that of shifts evoked by the same color stimuli in newborn children (i.e., green showed a "sympathicotropic" effect on the S which elicited accelerated heart and respiration rates with desynchronization of brain potentials while red stimuli produced a "parasympathicotropic" effect which resulted in deceleration of pulse and respiration and synchronization of brain potentials). The possible causes and underlying mechanisms accounting for differences in the reactions observed in young monkeys and children are discussed. (English summary) (26 ref)—*L. V. Majovski*.

Neurology & Electrophysiology

1958. Alexandrova, J. G. & Schlafer, T. P. (USSR Academy of Medical Sciences, Inst of Experimental Medicine, Leningrad) **[Responses of the hen hippocampal neurons to conditioned acoustic stimuli and stimuli of ecological significance.]** (Russ) *Zhurnal Vyssheĭ*

Nervnoi Deyatel'nosti, 1974 (Jan-Feb), Vol 24(1), 42-47. —Studied responses of hippocampal neurons in hens to a tonal stimulus. Responses were measured in 6 Ss exposed to a shriek uttered by a seized hen and 7 Ss who responded to a tone produced at 2,000 cps, 80 db, of equal intensity with the shriek. Results show a difference in response pattern of the conditioned responses of the hippocampal units to the shriek and tone. The responses of the hippocampal cells to the shriek was found greater than to the tone. Trace processes after the action of the shriek vs the tone were found more stable. Explanation of responding to acoustic stimuli and stimuli of ecological impact by hippocampal neurons is discussed. (English summary) (17 ref)—*L. V. Majovski*.

1959. Aminev, G. A.; Buyankina, V. V. & Buyankin, V. V. (Kazan State U, USSR) **[The relationship between the parameters of evoked potentials and memory span with single presentation of verbal information.]** (Russ) *Voprosy Psikhologii*, 1975 (May-Jun), No 3, 129-130. —Studied relationship between evoked potentials in frontal and occipital lobes and short-term memory. 9 Ss, 16 and 17 yrs old, listened to lists of 10 words read once, then repeated them. Before each list 10 flashes from a photostimulator were presented and the Ss' EEGs recorded. Best and worst trials were analyzed. A relationship was established between memory span and evoked potentials in the frontal lobes. It was less pronounced for the visual association areas. Poor memory was accompanied by a large quantity of low amplitude components in the evoked potential and an extension of its late components. Findings are in agreement with neuropsychologists' conceptualization of the role of the frontal lobes in voluntary memory.—*L. Zusne*.

1960. Andreassi, J. L. & Greco, J. R. (Baruch Coll, City U New York) **Effects of bisensory stimulation on reaction time and the evoked cortical potential.** *Physiological Psychology*, 1975 (Jun), Vol 3(2), 189-194. Studied reaction times and evoked cortical potentials (EPs) to visual and auditory stimuli alone and to the 2 in combination (bisensory stimulation), using 8 human Ss (22-32 yrs old). Bisensory stimulation resulted in significantly faster reaction times than those obtained with visual or auditory stimulation alone. Auditory reaction times were faster than visual. The amplitudes of EPs were significantly higher at both recording sites (O₁ and C₂) under conditions of bisensory as compared to unisensory stimulation. EP latencies were in the expected direction, i.e., all conditions using auditory stimulation resulted in shorter latencies than the visual stimulation alone condition. It is concluded that evidence for sensory interaction (facilitative) had been obtained in this experiment, and that the amplitude increases with bisensory stimulation were reflected in faster reaction times. No definitive statement regarding the CNS locus of this sensory interaction is made. (16 ref)—*Journal abstract*.

1961. Andreassi, J. L.; de Simone, J. J.; Friend, M. A. & Grota, P. A. (Baruch Coll, City U New York) **Hemispheric amplitude asymmetries in the auditory evoked potential with monaural and binaural stimulation.** *Physiological Psychology*, 1975 (Jun), Vol 3(2), 169-171. Examined auditory evoked potentials (AEPs)

in 5 male and 4 female students under 3 conditions of auditory stimulation: left ear, right ear, and the 2 ears simultaneously. It was hypothesized that the white noise stimulus would result in higher amplitude AEPs in the contralateral hemisphere as compared to the ipsilateral. This was confirmed. There were no latency differences in AEPs recorded from over ipsilateral and contralateral hemispheres. Results appear to provide further evidence for the predominance of the contralateral pathways of the auditory system.—*Journal abstract.*

1962. **Arbib, Michael A.** (U Massachusetts, Ctr for Systems Neuroscience, Amherst) **From automata theory to brain theory.** *International Journal of Man-Machine Studies*, 1975 (May), Vol 7(3), 279-295.—Surveys 8 levels of neural modeling, coupled with an extensive bibliography. The 8 levels are form-function relations in single neurons, lateral inhibition, mode selection, statistical mechanics, adaptive neural networks, holography, control theory, and cognitive modeling. 1963. **Arezzo, Joseph & Vaughan, Herbert G.** (Albert Einstein Coll of Medicine, Rose F. Kennedy Ctr for Research in Mental Retardation & Human Development, Yeshiva U) **Cortical potentials associated with voluntary movements in the monkey.** *Brain Research*, 1975, Vol 88(1), 99-104.—Attempted to define the morphology and timing of motor potentials (MP) and identify their sites of origin using direct recordings from the cortex of 4 adult rhesus monkeys which performed repetitive wrist extension movements on a VR schedule. The morphology and distribution of the monkey MPs are in agreement with earlier studies of the human MP and support the idea that the human N2 component is generated in the precentral gyrus.

1964. **Brazhnikov, A. N. & Holodnaya, E. I.** (Medical Inst, Zaporozhye, USSR) **[Conditioned responses, electrical activity and the state of some enzyme systems in the cerebral cortex of dogs during experimental neurosis.]** (Russ) *Zhurnal Vyssheĭ Nervnoĭ Deyatel'nosti*, 1974 (Jan-Feb), Vol 24(1), 103-110.—Studied the effects of experimental neurosis produced in 6 dogs on shifts of conditioned activity, electrical activity of motor, auditory and visual cortical areas, and the enzymatic state in neuronal electrochemical cells these areas. Data were recorded in 2 observation periods. Results show that considerable fluctuations in the magnitude of conditioned reflexes as well as in the cortical electrical activity occurred in the beginning phase due to overstrain of excitatory processes and development of transmarginal inhibition. Later results show diminished working capacity of the cortex and the conditioned reflexes were almost completely inhibited. EEG changes showed a reduction of amplitude and the frequency of its slow activity pattern. Enzyme activity of cortical neurons revealed a disturbance of metabolism involved in oxidative phosphorylation processes. These data and their relation to altered electrochemical and electrical activity due to induced experimental neurosis are discussed. (English summary) (24 ref)—*L. V. Majovski.*

1965. **Duff, Thomas A. & Cohen, David H.** (U Virginia, Medical School) **Optic chiasm fibers of the pigeon: Discharge characteristics in response to whole field illumination.** *Brain Research*, 1975, Vol 92(1), 145-148.—Experiments performed with 6 White Car-

neux pigeons support the conclusion that the high proportion of ganglion cell axons responsive to changes in whole field illumination is not unique to the retinotectal projection and that with respect to whole field illumination, the on/off type discharge pattern which is characteristic of the retinotectal system may in fact be representative of the overall retinal output with the ganglion cells behaving as a rather homogeneous population under such stimulus conditions.

1966. **Frey, Allan H.; Feld, Sondra R. & Frey, Barbara.** (Randomline, Inc, Huntingdon Valley, PA) **Neural function and behavior: Defining the relationship.** *Annals of the New York Academy of Sciences*, 1975 (Feb), Vol 247, 433-439.—Describes research on the relationship between neural function and behavior. 18 female rats were used in experiments which studied brain permeability, brain fluorescence, and behavior. Results lead to the conclusion that there is an association between behavioral modification and brain permeability change when similar energy parameters are employed.—*R. S. Albin.*

1967. **Hunt, Darwin P.** (New Mexico State U) **Measurements of a single galvanic skin response based upon its rate topography.** *Journal of General Psychology*, 1975 (Oct), Vol 93(2), 155-171.—Describes methods for the identification of the points of transition among 3 states (nonresponse, response, and recovery) of a single GSR. It is proposed that the topography of the rate of change of the skin resistance provides a basis for both the identification of the initiation and termination of a simple GSR and the estimation of the GSR magnitude. Data selected from a study in differential GSR conditioning suggest, for the present purposes, the desirability of a trichotomous classification of GSRs depending upon the response rates which typify the nonresponse state of a particular S under a particular set of conditions. Comparisons among estimates of the time of GSR initiation and termination and of the GSR magnitude by 3 different methods were made for each of the 3 classes. It is suggested that some of the current methods—in contrast to the proposed method of estimating the GSR magnitude, latency, and recruitment—may increasingly misestimate their values as the prereponse or nonresponse rate departs from zero and as the duration of the response increases.—*Journal abstract.*

1968. **Khachaturian, Z. S.; Shih, T. M.; Kerr, J. L. & Reisler, K. L.** (U Pittsburgh, Medical School) **Plasticity of evoked potentials in the cat pulvinar.** *Brain Research*, 1975, Vol 91(2), 299-305.—Attempted to differentiate neuroelectric events associated with conditioning from those not specific to learning by determining whether evoked potentials (EPs) elicited by a CS and background irrelevant stimuli undergo similar changes in amplitude and waveform during conditioning. Ss were 25 adult female cats with bipolar electrodes implanted at 4 loci selected from various structures including the pulvinar. Results obtained from the pulvinar were dramatically different from those observed in the other structures and indicate that (a) the pulvinar may play a role in perception and/or integration of auditory information; (b) changes in the size and shape of EPs during defense conditioning are due to one or more variables, including stimulus patterning, the affective state of the S, and the

- modality of a particular stimulus; and (c) the localization of the EPs, although observed in widespread areas of the brain, may not necessarily reflect neural processes associated with learning or memory; rather there are other specific areas which control differential changes in neuroelectric activity during learning.—L. Gorsey.
1970. Martinez, Richard I. & Brown, Joel B. (U of California) Correlation of receptive field properties of monkey LGN cells with the conduction velocity of retinal afferent input. *Brain Research*, 1975, Vol 92(1), 137-144.—Experiments performed on 4 adolescent and adult monkeys (*Macaca fascicularis*) showed that the conduction velocity (CV) of retinal input, rather than the discharge pattern, is correlated with color coding in the monkey lateral geniculate nucleus (LGN). Both the CV and its functional properties are relayed by the LGN to the visual cortex with little modification. (27 ref)
1970. Meyer, David P. (Arizona State U) *Anxiety, empathy, and selective responding in relation to operant conditioning of the occipital alpha rhythm*. *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1623-1624.
1971. Michalski, Andrzej; Kossut, Malgorzata & Zernicki, Boguslaw. (Nencki Inst of Experimental Biology, Warsaw, Poland) *Single-unit responses to natural objects in area 19 of cats with different early visual experiences*. *Acta Neurobiologica Experimentalis*, 1975, Vol 35(1), 77-83.—Conducted experiments with 12 cats deprived of pattern vision with hoods and 8 normal cats. During the 1st 3 mo postpartum, 8 of the hood-reared cats had visual experience with a 3-dimensional cross or a ping pong ball. Following pretectal brainstem transection in adulthood, unit responses to the cross and the ball were recorded in Area 19 within the projection of the area centralis. Stimulus dominance of the exposed object was manifested weakly. Both exposed and control objects activated more units in the experienced hood-reared cats than in hood-reared and normal controls. Compared with previous findings, results indicate that early visual experience affects Area 19 differently than Areas 17 and 18.—*Journal abstract*.
1972. Miller, S.; Van der Burg, J. & Van der Meché, F. G. (Erasmus U, Rotterdam, Netherlands) *Locomotion in the cat: Basic programmes of movement*. *Brain Research*, 1975, Vol 91(2), 239-253.—Observations in cats of flexion and extension movements of the 4 limbs support conclusion that the different forms of alternative locomotion (e.g., walking, trotting, or swimming) and in-phase locomotion (galloping or jumping) result from the interaction of "programs" for the coordination of (a) the homologous limbs (pair of hindlimbs or pair of forelimbs) and (b) the homolateral limbs (hind- and forelimb of the same side of the body). 1973. Monakhov, K. K.; Epstein, G. L.; Nikiforov, A. I. & Bochkarev, V. K. (USSR Academy of Medical Sciences, Inst of Psychiatry, Moscow) [Formal mathematical methods for studying the correlation between the characteristics of electrical brain activity and psychic phenomena.] (Russ) *Zhurnal Vyssheĭ Nervnoĭ Deyatelnosti*, 1974(Jan-Feb), Vol 24(1), 202-208.—Describes a formal mathematically based method used in the study of electrical brain activity and parapsychological phenomena in man. Analog-simulated computer programs are utilized in analyzing the integral components of organized brain processes. The applications of the method for diagnostic evaluation in psychiatric conditions and functional brain and psychical processes are discussed.—L. V. Majovski.
1974. Nathan, Richard D. & Hanley, John. (Emory U) *Spectral analysis of the EEG recorded during stimulation of the human fovea*. *Brain Research*, 1975, Vol 91(1), 65-77.—Performed computer spectral analysis of the EEGs of 6 17-31 yr old Ss recorded during monocular foveal stimulation. Stimulus wavelength and subjective brightness were varied independently to determine their importance to changes in the ongoing EEG. The contribution of oculomotor control to these effects and the retinal area of their origin were also investigated. Results show that (a) stimulation of the fovea reduced the amplitude of the EEG and the coherence between hemispheres at all frequencies (most dramatically in the alpha band), increased the variance of EEG amplitudes and widths of spectral peaks in the alpha band, and shifted these peaks to lower frequencies; (b) autospectral intensities in the alpha band were enhanced slightly at brightness levels near photopic threshold, but were unaffected by changes in stimulus wavelength; and (c) the fovea is the most effective retinal area in which irradiation attenuates ongoing alpha activity. (16 ref) —*Journal abstract*.
1975. Nörgren, Ralph & Pfaffmann, Carl. (Rockefeller U, New York, NY) *The pontine taste area in the rat*. *Brain Research*, 1975, Vol 91(1), 99-117.—Conducted an electrophysiological investigation of the pontine taste area in 32 male Sprague-Dawley rats, using gustatory, sapid, thermal, and tactile stimuli applied to anterior and posterior tongue. Results indicate that gustatory information from 2 distinct receptive fields may converge on the same central neuron. (56 ref)
1976. Novikova, R. V.; Fomin, B. A. & Meschersky, R. M. (USSR Academy of Sciences, Inst of Higher Nervous Activity & Neurophysiology, Moscow) [Responses of the rabbit lateral geniculate body to stimuli of different duration.] (Russ) *Zhurnal Vyssheĭ Nervnoĭ Deyatelnosti*, 1974(Jan-Feb), Vol 24(1), 164-171.—Describes on-and-off responses of the lateral geniculate body to retinal stimulation in 15 anesthetized rabbits. On-and-off memory was demonstrated by an increased amplitude of on-responses at 0.5- and 0.1-sec flashes and in its decrease at 0.3-sec flashes. Cortico-subcortical interaction resulted in an improvement of on-and-off memory of the 2nd and 3rd phases of on-responses, and on the duration of the stimulus. (English summary) (18 ref) —L. V. Majovski.
1977. Polyansky, V. B.; Sokolov, E. N. & Polkoshnikov, E. V. (Moscow State U, USSR) *Light-sound interaction in the neurons of the rabbit's visual cortex*. *Acta Neurobiologica Experimentalis*, 1975, Vol 35(1), 51-76.—Studied 100 cells of the visual cortex using flashes, clicks, and light-sound combinations with different delays. Under click stimulation, 49 neurons changed the total number of spikes. 28 cells responded to clicks with specific response patterns. In 23 cells the initial discharge occurred 60-70 msec after the onset of clicks. In 39 cells, responses to light-sound combinations

differed from the responses to flashes: when sound was added, 16 cells decreased their responses but 23 increased firing. Modifications of the light-evoked responses under acoustic stimulation were of 3 main types: 22 cells generated new response patterns, 18 showed a redistribution of peaks in the poststimulus-time histograms, and 3 demonstrated a desynchronization of the spike discharge. Examination of the heteromodal recovery cycle revealed that most of the cells increased their firing during 0-100 msec and decreased firing during 200-300 msec of the response time scale. The critical delays between light and sound, resulting in modification of the response for most of the cells, were within 100 msec in both directions. (27 ref)—*Journal abstract*.

1978. Puchinskaya, L. M. (USSR Academy of Sciences, Inst of Higher Nervous Activity & Neurophysiology, Moscow) [Evoked potentials to mentally conceived changes of intensity of photic stimuli.] (Russ) *Zhurnal Vysheĭ Nervnoi Deyatel'nosti*, 1974(Jan-Feb), Vol 24(1), 18-24.—Studied the effect of photic stimuli on summated evoked potentials (SEP) of occipital and cortical areas in 6 adult females and 5 adult males, aged 22-40 yrs. The effect of self-suggestion manifested itself in increased amplitudes of the positive-negative and subsequent negative-positive oscillations with peak latency of 112 msec for the 1st positive, 155 msec for the negative, and 215 msec for the 2nd positive component. Results show a statistically significant ($p < .05$) change of the amplitudes of the SEP late components. The phenomena of mentally conceived images and self-suggestion in relation to hypnosis are discussed. (English summary)—*Journal abstract*.

1979. Schlag-Rey, Madeleine & Schlag, John. (U California, Brain Research Inst, Los Angeles) Visual responsiveness of eye-movement neurons in thalamic internal medullary lamina of the cat. *Brain Research*, 1975, Vol 91(2), 311-314.—Experiments performed on chronically implanted cats show that (a) internal medullary lamina (IML) eye movement neurons can respond to visual stimuli and often do so with a latency of the same magnitude as the shortest latency of neurons in the lateral geniculate nucleus (LGN); (b) the IML neurons are sensitive to very dim and low contrast visual patterns; (c) the receptive fields of the IML units are larger than those in LGN cells; (d) a spatial correspondence exists between receptive field and directional field specificity of saccade-related discharges; and (e) IML cells participate in visuomotor integration.

1980. Vasilyeva, V. M. & Slavutskaya, M. V. (Lomonosov State U, Moscow, USSR) [Conditioned reflex to time at different stages of natural night sleep in man.] (Russ) *Zhurnal Vysheĭ Nervnoi Deyatel'nosti*, 1974(Jan-Feb), Vol 24(1), 116-123.—Described characteristics of EEG correlates of the conditioned reflex to time in 17 Ss aged 17-25 yrs. during night sleep. Rhythmic acoustic stimulation during phases C, D, E, and P was recorded in 13 Ss. Results show changes in EEG, GSR, and EKG rhythm preceding the stimulus suggesting the formation of a conditioned connection to time. Rate of formation and stability of the reactions was influenced by (a) specificity, (b) stage of sleep, and (c) time interval between presentation of stimuli. Results

further show that a conditioned reflex to time was produced more rapidly in a slow-wave sleep stage than in the activity of subcortical mechanisms of time count during the weakening of inhibitory influences of the cortex in a slow-wave sleep stage is discussed.—*Journal abstract*.

1981. Vreemen, G. & de Groot, D. (Mental Inst "Endegeest," Oegstgeest, Netherlands) The effect of monocular deprivation on synaptic terminals in the visual cortex of rabbits: A quantitative electron microscopic study. *Brain Research*, 1975, Vol 93(1), 15-24.—Studied the effect of prolonged (7-mo) monocular deprivation (right eye sutured) on the density of synapses and the number of synaptic vesicles in the visual cortex of rabbits. Results are discussed in the light of recent findings on the plasticity of synapses and the effect of retinal input on the development of the visual system. (26 ref)

1982. Wiesenfeld, Zsuzsanna & Kornel, Ezeriel E. (Cornell U) Receptive fields of single cells in the visual cortex of the hooded rat. *Brain Research*, 1975, Vol 94(3), 401-412.—Examined the receptive fields of 107 single cells in area of 17 of 23 male and female hooded rats. About 50% of the cells responded to stationary as well as moving stimuli and about 50% only to movement. A variety of receptive field types were observed. Some of the cells responding to stationary stimuli had circular receptive fields, some with and some without annuli, some had elongated receptive fields, some had irregular receptive fields. Of the cells that responded only to movement, some were orientation or direction specific and some were not. Only 2 cells responded to stimulation of the ipsilateral eye. Columnar organization of the cortex was not observed. (38 ref)—*Journal abstract*.

1983. Yamamoto, Takashi & Kawamura, Yojiro. (Osaka U, Dental School, Japan) Cortical responses to electrical and gustatory stimuli in the rabbit. *Brain Research*, 1975, Vol 94(3), 447-463.

1984. Yokota, Yoshikatsu. (Medical Coll of Shiga, Moriyama, Japan) Excitation of units in marginal rim of trigeminal subnucleus caudalis elicited by tooth pulp stimulation. *Brain Research*, 1975, Vol 95(1), 154-158.—Analysis of the responses of 62 marginal rim units in adult cats to tooth pulp stimulation suggested that the marginal rim of the subnucleus caudalis contains units only responding to noxious stimulation. These units may be functionally similar to those previously isolated from the marginal layer of the dorsal horn in the spinal cord.

1985. Zernicki, Bogusław & Michalski, Andrzej. (Nencki Inst of Experimental Biology, Warsaw, Poland) Single-unit responses to natural objects in visual areas 17 and 18 of cats reared under different visual experiences. *Acta Neurobiologiae Experimentalis*, 1974, Vol 34(6), 697-713.—In an experiment with 21 hood-reared and normal cats, a black 3-dimensional cross and a black ping-pong ball were used as visual stimuli. During the 1st 3 mo of life some hood-reared Ss had play-box training with 1 object. Unit responses were recorded in areas 17 and 18 within the projection of the area centralis in adult Ss with a pretigeminal brain stem transection. In all Ss the ocular following reflex was normal to both objects, and about 60% of the cells were responsive, nearly all of them to both objects. The object available in the play-box, however, evoked stronger

responses on the average than the control object. Thus, the visual cortex and responses to natural objects are modified by early visual experience. (22 ref)—*Journal abstract*

1986. Zisgarelli, Gene R.; Mallory, William A.; Ko, G. K. & Raghupathy, E. (Sonoma State Hosp. Brain-Behavior Research Ctr, Eldridge, CA) Evidence for noninvolvement of brain glycoprotein metabolism in escape training. *Journal of General Psychology*, 1975 (Oct), Vol 93(2), 199-205.—In 2 experiments, 10 21-day-old Sprague-Dawley rats received escape training in a 2-choice 4-alley water maze. Following training, glycosyl transferase activities of brain microsomal fractions were assayed in control and experimental Ss. No significant group differences were observed in the extent of transfer of galactose and N-acetylgalactosamine to endogenous or exogenous acceptors. Results suggest a lack of participation of whole brain glycoprotein metabolism in an escape learning situation. (15 ref)—*Journal abstract*.

Physiological Processes

1987. Borbély, Alexander A.; Huston, Joseph P. & Waser, Peter G. (U Zurich, Inst of Pharmacology, Switzerland) Control of sleep states in the rat by short light-dark cycles. *Brain Research*, 1975, Vol 95(1), 89-101.—Investigated the effects of 60-60 min light-dark (LD) cycles on sleep, feeding, drinking, and motor activity in male albino Sprague-Dawley rats. Waking, consummatory behavior, and motor activity were inhibited by light, while sleep was enhanced; the effects were dependent on the intensity of light. The percentage of slow wave sleep (SS) increased within the 1st 15 min of the light period and reached a plateau within 30 min. The reduction of SS during darkness showed a similar time course. The percentage of paradoxical sleep (PS) started to increase only 15 min after the onset of light and continued to rise during the 1st 15 min of darkness. All parameters exhibited a free-running circadian rhythm. The LD-induced changes of SS were largest during the circadian phase in which S was active. The changes of PS which succeeded the onset or offset of light were largest in the inactive circadian phase. Hypotheses to account for the temporary dissociation between the 2 sleep states are discussed. (29 ref)—*Journal abstract*.

1988. Coles, Michael G.; Porges, Stephen W. & Duncan-Johnson, Connie C. (U Illinois, Champaign) Sex differences in performance and associated cardiac activity during a reaction time task. *Physiological Psychology*, 1975 (Jun), Vol 3(2), 141-143.—Examined the possibility that men and women, who are known to differ in reaction-time (RT) performance, also differ in parameters of physiological activity which can predict certain forms of behavior. Accordingly, measures of RT and cardiac activity were recorded from 10 male and 10 female students (18-21 yrs old) during a variable foreperiod RT task. Males showed faster RTs, greater cardiac decelerations, and higher levels of heart-rate variability during the foreperiod. Trend analyses revealed sex differences in the heart-rate response to the onset of the warning signal, but not in the response to the imperative signal. Results indicate that those measures of cardiac activity which have been shown previously to

predict performance tend to differentiate between the sexes when there are sex differences in performance.—*Journal abstract*.

1989. Haywood, Jeff; Hambley, John & Rose, Steven. (Open U, Brain Research Group, Bletchley, England) Effect of exposure to an imprinting stimulus on the activity of enzymes involved in acetylcholine metabolism in chick brain. *Brain Research*, 1975, Vol 92(2), 219-225.—One-day-old Ross 1 chicks were exposed for 60 min to either an imprinting stimulus or a dark box. They were killed at 0, 1, 6, or 12 hrs after the end of this treatment, and the activities of acetylcholinesterase (AChE) and choline acetyltransferase (ChAc) assayed in the forebrain roof, forebrain base, and midbrain. The activity of AChE increased by 11% in the roof of stimulus-exposed Ss 1 hr after exposure and in base (by 13%) and midbrain (by 8%) 6 hrs after exposure. At 12 hrs the only difference was a lowered AChE (14%) activity in midbrain of stimulus-exposed Ss. By contrast only 1 difference was found in ChAc activity between the 2 types of Ss: an elevation of 10% immediately after the end of treatment (0 h) in the midbrain of stimulus-exposed Ss. (16 ref)—*Journal abstract*.

1990. Haywood, Jeff; Rose, Steven P. & Bateson, Pat. (Open U, Brain Research Group, Bletchley, England) Changes in chick brain RNA polymerase associated with an imprinting procedure. *Brain Research*, 1975, Vol 92(2), 227-235.—Measured the specific activity of RNA polymerase in nuclei from 3 brain regions of 1-day-old chicks which had been exposed for different periods to either an imprinting stimulus or diffuse light. Data were those from Ss kept in the dark. After 15 min treatment there was a decrease in enzyme activity in the forebrain base of both stimulus- and diffuse light-exposed Ss as compared to dark Ss, which disappeared by 30 min treatment. After 30 min treatment there was increased activity of the enzyme in the forebrain roof of the stimulus-exposed as compared to both diffuse light-exposed and dark-maintained Ss. There were no differences in activity in any region from 45 min to 120 min of treatment.—*Journal abstract*.

1991. Johnston, Robert E. (Cornell U) Scent marking by male golden hamsters (*Mesocricetus auratus*): II. The role of the flank gland scent in the causation of marking. *Zeitschrift für Tierpsychologie*, 1975 (Mar), Vol 37(2), 138-144. Observation of male hamsters in large areas shows that (a) a male has customary marking posts and that a 2nd male introduced into the 1st male's area will mark (i.e., deposit secretion from dorso-lateral flank gland) in the same places; (b) males mark less in the home cages of flank glandectomized males than in the cages of normal males; and (c) flank glandectomized males mark within the range of frequencies for normal males, indicating that the sensory feedback from a male's own flank gland scent is not necessary for normal levels of flank marking. (German summary) (17 ref)—*Journal summary*.

1992. Kawamura, Yojiro. (Osaka U, Dental School, Japan) Role of sensory factors in chewing and feeding behavior. *Pharmacology, Biochemistry & Behavior*, 1978, Vol 3(Suppl 1), 163-173.—Argues that, since feeding behavior has a complex physiological background, in the physiology of feeding behavior not only the mechanisms

in the hypothalamus, but also input and output physiologic factors which stimulate and/or inhibit the central network for feeding and aversion behavior must be considered. Normal feeding and aversion behavior are accomplished by a series of highly coordinated physiological functions involving various parts of the body, and humoral, hormonal, metabolic, and sensory and motor functions for feeding behavior must be well considered. In the present paper, a neurophysiological network concerning feeding and aversion behavior is discussed. Relations between input, central, and output factors for these behaviors are considered. As an input factor, a role of the nerve impulses of the chorda tympani and lingual nerves is evaluated. As a central factor, involvement of the neurons in the cortical taste area is discussed, and response patterns of cortical taste neurons to negative and positive taste information are analyzed with regard to taste perception mechanisms. In addition, mechanisms in the posterior hypothalamus for the taste aversion behavior are explained through ablation and recording techniques in the rat; the neuromuscular mechanisms of chewing, which complete the feeding behavior, are also discussed. (24 ref)—*Journal abstract*.

1993. Mescheryakov, V. A. (USSR Academy of Medical Sciences, Inst of Experimental Medicine, Leningrad) [Changes in the cardiac component of alimentary conditioned reflexes during reorganization of the functional state of the brain.] (Russ) *Zhurnal Vyssheĭ Nervnoĭ Deyatel'nosti*, 1974 (Jan-Feb), Vol 24(1), 95-102.—Using the alimentary secretory method, the effect of stereotype presentation stimuli on heart rate activity in 5 dogs was examined. Results show a linear dependence of the extent of heart rate acceleration under the action of positive conditioned stimuli on the initial heart rate. (English summary) (33 ref)—*L. V. Majovski*.

1994. Moisset, Beatriz; Hendley, Edith D. & Welch, Bruce L. (Jackson Lab, Bar Harbor, ME) Norepinephrine uptake by cerebral synaptosomes of mouse: Strain differences. *Brain Research*, 1975, Vol 92(1), 157-164.

Reports strain differences in affinity for uptake of norepinephrine (NE) by crude synaptosomal preparations of 3 brain regions of male BALB/cJ and C57BL/10J mice and describes apparent strain differences in maximal velocity of uptake which were actually attributable to strain differences in fighting behavior. Results provide support for the idea that there is a genetic difference in the affinity for uptake of NE by brain synaptosomes between BALB/cJ and C57BL/10J mice. (15 ref)

1995. Myers, R. D. (Purdue U, Lab of Neuropsychology) Brain mechanisms in the control of feeding: A new neurochemical profile theory. *Pharmacology, Biochemistry & Behavior*, 1975, Vol 3(Suppl 1), 75-83.—Presents a new theory in which 2 profiles of chemical activity are postulated to regulate the intake of food. One is a peripheral profile which consists of the ratio of all blood-borne substances that are involved in energy balance, lipid deposition, and other aspects of long and intermediate-term regulation. The changes in the ratio are presumably monitored by structures in the CNS. The 2nd profile consists of the chemical activity of transmitter and other neurohumoral factors within the same structures in the CNS. The ratio in their release provides

appropriate neural signals which serve to activate or inhibit the various events of the feeding mechanism. Preliminary attempts to characterize profile constituents in samples of fluid collected from the fasted and satiated cat are described. Results of experiments on the role of the forebrain catecholamines in food intake are also presented. (70 ref)—*Journal abstract*.

1996. Nance, Dwight M. & Gorski, Roger A. (U California, Los Angeles) Neurohormonal determinants of sex differences in the hypothalamic regulation of feeding behavior and body weight in the rat. *Pharmacology, Biochemistry & Behavior*, 1975, Vol 3(Suppl 1), 155-162.—A review of the literature indicates that androgens produce a permanent organizational effect on the brain of rats during a postnatal period of sexual differentiation. In male rats, this process occurs as a consequence of the endogenous release of androgens; however, exposing female rats to exogenous androgens during this critical period initiates the same process, such that early exposure to androgens results in a dose-dependent increase in body weight. Sex-specific gonadal hormones further modulate this basic organizational difference in that androgens and estrogens have facilitatory and inhibitory effects, respectively, on the regulation of food intake (FI) and body weight (BWt). Data support the idea of a functional sex difference in the hypothalamic regulation of FI and BWt. In general, the same kinds of behavioral tests which differentiate between normal animals and rats with lesions of the ventromedial hypothalamus (VMH) or lateral hypothalamus also differentiate between male and female rats. It has been shown that the VMH may be a primary neural site for the organizational effects of androgens on the brain. A model is proposed to account for sex differences in energy regulation. 1997. Panksepp, Jaak. (Bowling Green State U) Central metabolic and humoral factors involved in the neural regulation of feeding. *Pharmacology, Biochemistry & Behavior*, 1975, Vol 3(Suppl 1), 107-119.—Summarizes evidence that supports the theory that long-term regulation of energy balance is elaborated by an interface between metabolism and brain activity within the medial hypothalamus, while short-term satiety effects are a more direct consequence of dampened activity in lateral hypothalamic feeding circuits. Possible relationships of these functions to autonomic control circuits are discussed. (75 ref)—*Journal abstract*.

1998. Petre-Quadens, Olga; Hussain, Hadji & Balaratnam, C. Paradoxical sleep characteristics and cultural environment. *Acta Neurologica Belgica*, 1975 (Mar-Apr), Vol 75(2), 85-92.—The Temiars are a tribe of negroid pygmies of basically Proto-Malaysian affinities. Field work in the Malaysian jungle provided observations of sleep-usefulness cycle of 2 Temiar 20-y-olds. This cycle was monophasic, circumstances permitting. Ss' rest-activity cycle at night was similar in the jungle and in the laboratory. Polygraphic total night-sleep recordings were made in the EEG laboratory in the Hospital Besar. The eye-movement frequencies of paradoxical sleep were compared with those from young adults of the West. Although the differences were not significant, the REM-densities of the Temiars were

and humoral factors associated with deposits of adipose tissue and metabolic activity.

Psychophysiology

2003. Berta, Mario; Monti, Jaime; Trenchi, Hugo & Rodríguez, M. (Hosp de Clinica, Montevideo, Uruguay) [Directed reverie as a psychological variable in the organization of sleep. An EEG study.] (I ren) *Estudios Psicoanalíticos* 1974(Dec), No 18, 203-207.—Studied the EEG and REM patterns of 2 male and 2 female students 20-25 yrs old who volunteered to sleep in the dream laboratory for at least 6 nights. 2 nights were for adaptation, 2 were control nights with recording, 2 were nights when directed-reverie sessions occurred 30 min before the beginning of sleep. Length of wakefulness, length of NREM sleep, length of REM sleep, time until NREM sleep and density of eye movements during REM sleep were all unaffected by the directed-fantasy procedure; whereas time from falling asleep until REM was longer ($p < .02$) and of REM periods was less ($p < .05$) in the directed-reverie condition. 2 Ss also participated in a control condition in which they conversed with E about affectively significant topics just before sleep; for these Ss, latency of REM sleep and density of eye movements during REM were greater after directed reverie than after conversation.—F. Auld.

2004. de Barros-Ferreira, Mario. [Directed reverie and electroencephalography.] (I ren) *Estudos Psicoanalíticos* 1974(Dec), No 18, 187-200. Studied physiological responses of 8 normal women (mean age 28) and 2 normal men (mean age 32) (a) during a period of rest with eyes closed, (b) immediately following the instruction "Now we'll begin," (c) while they reported a directed reverie, and (d) while they imagined climbing and descending. E measured EEG, eye movements, EMG from the chin, EKG, and GSR. After the warning instruction, there was increased GSR. During the report of the directed reverie, alpha rhythm was blocked, blinking and eye movements increased, and EMG increased, compared to base level. In short, activity during the directed reverie was like that during waking repose with eyes closed (and unlike activity during sleep or hypnosis), except for blocking of alpha. However, after long silences in the session, when Ss were half asleep, the EEG resembled that seen during light sleep. (50 ref)—F. Auld.

2005. Musicant, Robert A. (U Oklahoma, Health Sciences Ctr) **Evoked potentials and attention.** *Biological Psychology Bulletin*, 1975(Feb), Vol 4(1), 1-9.—Reviews the literature on the effects of selective attention on averaged evoked potentials in humans. Emphasis is placed on the control procedures necessary to demonstrate an effect of attention per se, as opposed to possible general effects of shifts in arousal. There is sufficient evidence to favor the hypothesis that there is a direct effect of attention on evoked potentials. There may be consistent individual differences in the effect of attention on an early component of the evoked potential, while a late component shows little intersubject variability. The proposal is discussed in terms of 2 separate attentional processes that may be reflected by the early and late components, respectively. (21 ref)—Journal abstract.

PHYSIOLOGICAL INTERVENTION

2001. Arushanyan, I. B. & Bekasov, Yu. A. (Medical Inst. of USSR. [On the mechanism of the caudate nucleus participation in the control of behavior.] (Russ.) *Zhurnal Vysshei Nervnoi Deiatel'nosti*, 1974 (Jan-Feb), Vol. 24(1), 55-63. — Studied the effects of caudate nucleus stimulation on 25 cats who had received caudate nucleus ablations in 2 series of operations. Results of the chronic-experimented cats showed that the caudate nucleus depressed aggressive-defensive reactions induced by stimulation of the caudate nucleus structures and by sensory signals. In the acute-experimented Ss, the caudate ablation effects did not significantly change primary and associative responses of single sensorimotor units to sensory signals. Evoked potentials of reticular and hypothalamic origin were depressed during neostriate inhibition. These findings are discussed in relation to caudate nucleus control of complex aggressive-defensive behavior. (English summary) (35 ref.)—L. V. Majovski.

2008. Baldessarini, Ross J.; Amatruda, Thomas T.; Griffith, Fred F. & Gerson, Sylvia. (Harvard U. Medical School, Massachusetts General Hosp., Boston) Differential effects of serotonin on turning and stereotypy induced by apomorphine. *Brain Research*, 1975, Vol. 93(1), 158-163. — Prepared male Charles River rats with unilateral nigro-striatal lesions and measured their contralateral circling responses to a low dose of apomorphine (0.3 mg/kg) as well as the stereotyped gnawing responses of other intact rats to higher doses of apomorphine (0.5 or 1.0 mg/kg) after several treatments that increase or decrease the availability or actions of 5-hydroxytryptamine (5-HT; serotonin) in the forebrain. Results show that circling was increased by a serotonin blocking agent (methysergide; 5mg/kg ip) and an inhibitor of serotonin synthesis (para-chlorophenylalanine; 300 mg/kg ip) and diminished by the precursor 5-hydroxytryptophan (100 mg/kg ip). Stereotypy was not modified by even larger doses of these agents or by the 5-HT neuron lesioning agents 5,6- (33 or 75 µg) or 5,7-dihydroxytryptamine (200 µg). Results indicate that these 2 syndromes are pharmacologically dissimilar and that caution should be exercised in drawing conclusions about central functions mediated by dopamine from either of them in isolation. It is concluded that continued questioning of the general equivalence of the circling and stereotypy syndromes as "models" of central dopami-

2012. Hoffman, Andrew et al. (Stanford U. Medical School, Lab of Behavioral Neurochemistry) Delayed increase of adrenal TH and PNMT activities following cold stress in the mouse. *Life Sciences*, 1975(Aug), Vol. 17(4), 557-562. — The activities of the adrenal enzymes tyrosine hydroxylase (TH) and phenylethanolamine-N-methyltransferase (PNMT) were elevated when male CBA/J mice were subjected to 4°C ambient temperature. Only a single hour of cold exposure was required to achieve increased activity, provided that the measurements were made 12 hrs after the cold exposure was initiated. After the cold stress was terminated, PNMT activity remained elevated for 12 hrs. TH demonstrated a biphasic response to cold exposure, as the enzyme activity showed a 2nd increase 12 hrs after the stress ended. Data indicate that short periods of stress result in

demonstrated biochemical changes that persist long after the stress has ended.—*Journal abstract*

2013. Hunt, Edward L.; King, Nancy W. & Phillips, Richard D. (Walter Reed Army Inst of Research, Washington, DC) Behavioral effects of pulsed microwave radiation. *Annals of the New York Academy of Sciences*, 1975(Feb), Vol 247, 440-453.—Describes research to determine the microwave dosage levels that, in association with mild to severe microwave heating of the experimental animal, produce prompt degradations in its performance. 3 behaviors were studied among male rats: exploratory activity, swimming, and discrimination performance on a vigilance task. Negative effects are noted with all behaviors. These results are interpreted as evidence for alterations in performance rather than as interference with trained skills. (15 ref)—*R. S. Albin*.

2014. Johanson, J. E. & Voeste, R. A. (NASA, Ames Research Ctr, Moffett Field, CA) The effects of malnutrition on the developing brain stem of the rat: A preliminary experiment using the lateral vestibular nucleus. *Brain Research*, 1975, Vol 89(1), 170-174.—In a study with pregnant female rats who were placed on either high (27%) or low (8%) protein diets at 8 days gestation, evidence was found that cell sizes do not significantly change in deprived vs control pups, but that cell number per unit area increases. Results suggest that protein malnutrition probably affects mainly the neuropil surrounding the cell bodies.

2015. Krauz, V. A. (USSR Academy of Medical Sciences, Inst of Experimental Medicine, Leningrad) [Relationships between the ventral and dorsal hippocampus in the case of improvement or deterioration of short-term memory.] (Russ) *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1974(Jan-Feb), Vol 24(1), 33-41.—Studied the effects of neurotropic drugs and electrical stimulation on hippocampal structures with reference to short-term memory in 6 dogs and 10 rabbits. Electrode implantation was done on all Ss after the method of Kupalov (1964). Results show that neurotropic drugs (e.g., phenamine, ethymisol, strychnine, and galantamine) prolonged the maximum time of delayed reactions used as a test for short-term memory. Electrical stimulation of the ventral hippocampus brought about improvement of short-term memory. Electrical stimulation of the dorsal hippocampus brought about deterioration of short-term memory in Ss run, characterized by excitability of the ventral part of the structure. The different functional state of the ventral and dorsal hippocampus in the memory processes possibly resulting from different relationships between these formations and the mesencephalic reticular formation is discussed in conjunction with improvement of the short-term memory induced by neurotropic drugs. (English summary) (32 ref)—*L. V. Majovski*.

2016. Lavie, Peretz; Levy, C. Michael & Coolidge, Frederick L. (U California, San Diego) Ultradian rhythms in the perception of the spiral aftereffect. *Physiological Psychology*, 1975(Jun), Vol 3(2), 144-146.—Tested the possibility that ultradian rhythms exist in the perception of the spiral aftereffect (SAE) with periodicities similar to those of the REM-NREM cycle. 6 female and 2 male human Ss 19-24 yrs old were tested on the SAE for 8-hr periods during the day and night. Using time series analyses, prominent cyclic compo-

nents in the perception of the illusion were revealed, with periodicities of the SAE the same order of magnitude as the REM-NREM cycle during both night and day periods. It appeared that the duration of the SAE could be used as a sensitive behavioral index of the basic rest-activity cycle.—*Journal abstract*.

2017. LeVere, T. E.; Morlock, Gerald W. & Hart, F. D. (North Carolina State U, Raleigh) Waking performance decrements following minimal sleep disruption: The effects of habituation during sleep. *Physiological Psychology*, 1975(Jun), Vol 3(2), 147-154.—6 male human Ss (ages 19-27) were exposed on different nights to 0, 6, or 24 presentations of a 15-sec burst of filtered auditory noise, and their morning waking performance was measured by a reaction-time task known to be sensitive to minimal sleep disturbances. On nights when 24 stimuli were presented, the Ss' average arousal response was significantly less than that when only 6 stimuli were presented, thus demonstrating the occurrence of habituation. However, the decreased average arousal with 24 stimuli was not associated with superior morning performance, which was significantly better following the occurrence of only 6 stimuli. The data suggest that the relation between sleep disruption and waking performance is a function not only of the arousal produced by the individual stimulus occurrences but also, and perhaps more importantly, of the number of stimuli occurring during the night. (18 ref)—*Journal abstract*.

2018. Petitjean, Françoise; Sakai, Kazuya; Blondaux, Chantal & Jouvet, Michel. (U Lyon, France) [Hypersomnia by isthmus lesion in the cat: II. Neurophysiological and pharmacological study.] (Fren) *Brain Research*, 1975, Vol 88(3), 439-453.—In a study with 38 adult cats, the bilateral destruction of the region of the dorsal norepinephrine bundle in the isthmus or in the mesencephalon induced a significant increase of both paradoxical sleep (PS) (up to 400%) and of slow-wave sleep (SWS). The increase of PS lasted for 4-5 days while the increase of SWS lasted 8-10 days. The same phenomenon was observed after total hypophysectomy. Control lesions in the isthmus outside the area of the dorsal norepinephrine bundle did not affect significantly the sleep-waking cycle. Pretreatment with para-chlorophenylalanine suppressed the increase of sleep when the lesion was made at the time of maximum insomnia, while a significant increase of PS was still observed if the lesion was made at the time of the recovery of sleep. The mechanisms of this hypersomnia are discussed in light of the biochemical results showing an increase of the biosynthesis of serotonin in the rostral raphe system. It is postulated that some neurons of the dorsal norepinephrine bundle might tonically control the activity of the raphe system. (28 ref)—*English abstract*.

2019. Roberti, B. et al. (Medical Biological Lab TNO, Rijswijk, Netherlands) Preliminary investigations of the effects of low-level microwave radiation on spontaneous motor activity in rats. *Annals of the New York Academy of Sciences*, 1975(Feb), Vol 247, 417-424.—Studied the effects of low-level microwave radiation to determine whether the current standards for exposure should be changed. In 2 experiments with male rats no differences in spontaneous activity were found between

those irradiated and those not irradiated, indicating that low-level microwave radiation had no deleterious effects.—*R. S. Albin.*

2020. **Rose, James D.** (Emory U. Medical School)

Ascending projections of pontine genital sensory neurons in the female cat. *Brain Research*, 1975, Vol 85(1), 64-68.—Studied the anatomical interrelations between the pontine and more rostral levels of the brainstem genital sensory system by identifying the rostral course of axons from pontine neurons using an antidromic invasion technique. Data from recordings in 5 ovariectomized female cats demonstrate a projection from genital sensory neurons in the lateral pons to the ipsilateral medial midbrain and posterior diencephalon and suggest that some pontine cells may form synapses with midbrain neurons.

2021. **Siegel, Harold I. & Rosenblatt, Jay S.** (U Kansas, Medical Ctr, Kansas City) **Hormonal basis of hysterectomy-induced maternal behavior during pregnancy in the rat.** *Hormones & Behavior*, 1975(Sep), Vol 6(3), 211-222.—Hysterectomy during the last half of pregnancy (i.e., Days 10-19) induces a rapid onset of maternal behavior; ovariectomy in addition to hysterectomy, prevents this effect. In the present study, estradiol and progesterone were tested for their ability to restore short-latency maternal behavior in 152 hysterectomized-ovariectomized (HO) female Charles River CD rats operated on the 10th, 13th, 16th, or 19th days of pregnancy. A single injection of either 20 or 100 µg/kg estradiol benzoate (EB) immediately following HO either alone or followed by 0.5 mg progesterone (P) 44 hrs later restored short-latency maternal behavior similar to that observed following hysterectomy only. The lower dose of EB was equally effective at all stages of pregnancy, and P was unnecessary to induce maternal behavior. The effectiveness of EB in inducing maternal behavior is discussed in relation to the hormonal changes which follow hysterectomy during pregnancy and to those which are associated with the normal onset of maternal behavior around parturition. (33 ref)—*Journal abstract.*

2022. **Thomas, John R.; Finch, Edward D.; Fulk, David W. & Burch, Linda S.** (US Naval Medical Research Inst, Experimental Psychology Div, Rockville, MD) **Effects of low-level microwave radiation on behavioral baselines.** *Annals of the New York Academy of Sciences*, 1975(Feb), Vol 247, 425-432.—Examined the effects of microwave radiation on the nervous system by observing changes in the behavior of 4 male albino rats. Ss were conditioned to respond by leverpressing on multiple schedules of reinforcement after exposures to low levels of microwave radiation. The low rates of responding produced by the differential reinforcement of low rate schedule increased after irradiation, while the high rates of responding produced by the fixed ratio schedule decreased after irradiation. It is concluded that not only do low levels of microwave radiation produce effects on the CNS, as evidenced by behavioral change, but also that such changes are influenced by the interactions of the organism with the environment.—*R. S. Albin.*

2023. **Webster, Molly & Webster, Douglas B.** (Louisiana State U, Medical Ctr, Kresge Hearing Research Lab of the South) **Maze running in kangaroo rats with sensory deprivations.** *Physiological Psychology*,

1975(Jun), Vol 3(2), 195-200.—Tested the importance of different types of sensory cues in the maze-running activity of 53 wild kangaroo rats. The Ss, previously trained to run a complex maze, were retested with and without sensory deprivations. Time, errors, collisions, and percent of trials completed were measured. Only blinding had a significant effect on performance. Cutting the vibrissae in combination with blinding had a secondarily strong effect. Deafening (but not olfactory bulbectomy) combined with blinding and cutting the vibrissae also had a strong effect. Bulbectomy had no effect except when combined with blinding, deafening and cutting vibrissae. Maze running may be related to activity within the burrow and to surface activity at night, and these activities are discussed in light of the results.—*Journal abstract.*

2024. **Yamamoto, Takashi.** (Osaka U, Dental School, Japan) **Linguo-hypoglossal reflex: Effects of mechanical, thermal and taste stimuli.** *Brain Research*, 1975, Vol 92(3), 499-504.—In a study with 10 male Sprague-Dawley rats, cold and 0.05 M HCl, 1.0 M NaCl, and 0.5 M KCl and mechanical stimuli applied to the tongue surface evoked hypoglossal efferent nerve activity, while warm and other taste solutions had very weak or no effects on nerve activity. Cooling the tongue enhanced and warming depressed a test linguo-hypoglossal reflex evoked by mechanical stimulation. Taste stimulation modified the size of the reflex (15 ref)

Electrical Stimulation

2025. **Babington, R. G. & Wedeking, P. W.** (Squibb Inst for Medical Research, Princeton, NJ) **Blockade of tardive seizures in rats by electroconvulsive shock.** *Brain Research*, 1975, Vol 88(1), 141-144.—Determined whether the pharmacological effects of antidepressants can be mimicked with ECS in rats. Tardive seizures were induced in Ss by implanting bipolar electrodes in the centromedial amygdala, septum, or on the sensorimotor cortex. Ss were then stimulated electrically once daily for 1 min with a 50-µA, 60-Hz constant current sine wave. Within 3-4 wks, 5-7 sec of stimulation elicited seizures that lasted 45-75 sec. As with tricyclic antidepressant drugs, the most profound effect of ECS was on the amygdaloid-induced response; seizures elicited from the septum or cortex showed less of a reduction not only in magnitude, but also in duration of the suppression. In Ss with electrodes only in the amygdala in which seizures were not established prior to ECS, ECS treatment 30 min before stimulation of the amygdala completely blocked tardive seizures, but as soon as ECS was terminated, the sensitization process proceeded in normal fashion. Results support the concept that the amygdala is involved in depression and that successful treatment of depression requires an effect on that structure. (15 ref)—*L. Gorsey.*

2026. **Berntson, Gary G. & Beattie, Michael S.** (Ohio State U, Lab of Comparative & Physiological Psychology) **Functional differentiation within hypothalamic behavioral systems in the cat.** *Physiological Psychology*, 1975(Jun), Vol 3(2), 183-188.—Studied the degree of functional independence and overlap of a region of the cat hypothalamus where biting attack and the threat behavior can be elicited. An electrical brain-stimulation

analysis was completed in 8 cats by the use of roving stimulation electrodes. Results indicate that, while attack and threat have partially overlapping anatomical representations, there is considerable anatomical dissociation between these behaviors, even within overlap areas. However, it was found that a composite stimulation map based on anatomical data pooled across Ss, substantially overestimated the size of response areas and the degree of anatomical overlap between responses for a given S. Results are interpreted as supporting the view that the hypothalamus contains partly overlapping, but functionally specific, mechanisms for different behaviors. (26 ref) — *Journal abstract*

2027. Feger, Jean & Ohye, Chihuro. (U René Descartes, UER de Psychologie, Paris, France) **The unitary activity of the substantia nigra following stimulation of the striatum in the awake monkey.** *Brain Research*, 1975, Vol 89(1), 155-159.—Recorded activity in 55 cells localized in the substantia nigra of 3 monkeys. Results reveal that (a) there were 2 patterns of response to caudate stimulation: one with an inhibition only and the other with an excitation preceding the inhibition; and (b) there was no clear difference in the spontaneous activity of the cells or their responses in function of their localization. (25 ref)

2028. Gasanov, G. G. & Khanukayev, E. M. (Azerbaijan Academy of Sciences, Karayev Inst of Physiology, Baku, USSR) **[The influence of electrical stimulation of the amygdala on emotional motivational behavior, the level of water consumption and the EEG.]** (Russ) *Zhurnal Vyssheĭ Nervnoĭ Deyatel'nosti*, 1974(Jan-Feb), Vol 24(1), 132-137.—Studied the effect of short vs long periods of electrical stimulation of the basolateral part of rabbits' amygdalas on water consumption. The method used for producing inhibition of drinking was stimulation of the S's amygdala with a below threshold intensity electrical shock. Decrease in daily water consumption and frequency of drinking reactions were recorded during the poststimulatory period of applied stimulus. Results show a drop in the level of motivational excitation and blockage of drinking accompanied by EEG and behavioral data. An explanation of the kinds of blockage which are accompanied by EEG after discharges, hyperactivation, and forced movements as a consequence of intracranial disturbances in the brain is provided. (English summary)—*L. V. Majovski*.

2029. Gavrilova, L. N. (USSR Academy of Medical Sciences, Inst of Experimental Medicine, Leningrad) **[Conditioned activity and EEG of brain structures in the dog, evoked by stimulation of the cingulate gyrus.]** (Russ) *Zhurnal Vyssheĭ Nervnoĭ Deyatel'nosti*, 1974(Jan-Feb), Vol 24(1), 48-54.—Studied the effect of 1- vs 2-day starvation on (a) conditioned and unconditioned salivation; (b) pulse, rate, and EEG following simultaneous and isolated electrical stimulation of the cingulate gyrus; and (c) simultaneous stimulation of the dorsomedial nucleus of the thalamus in 5 dogs. The method of starvation followed by a conditioning paradigm producing emotional stress caused by the 2-day starvation made it possible to study the physiological organization of the above parameters involved in the alimentary reflex. Results show an increase in the correlation coefficients computed between EEG rhythm

in the cingulate gyrus' field and the dorsomedial thalamic nucleus before and after electrical stimulation. Duration starvation, slow waves (12-14 cps), and high amplitude voltage (100-250 mv) activity was recorded in the field of the cingulate gyrus. The significance of these findings in relation to the organization of the alimentary reflex and limbic system is discussed. (English summary) (35 ref)—*L. V. Majovski*.

2030. Hall, Richard E. & Marr, Harry B. (Wake Forest U, Bowman Gray Medical School) **Influence of electrical stimulation of posterior orbital cortex upon plasma cortisol levels in unanesthetized sub-human primate.** *Brain Research*, 1975, Vol 93(2), 367-371.—Obtained direct measures of plasma cortisol levels using radioimmunoassay techniques following electrical stimulation of the posterior orbital cortex in conscious rhesus monkeys. Electrical stimulation caused significant increases in arterial plasma cortisol. Data suggest that the posterior orbital cortex plays an important role in modulating the systemic plasma cortisol levels during emotional stress and that this cortical region may also be involved in psychosomatic disorders. (21 ref)

2031. Handwerker, Mark J. & Fishbein, William. (U California, Irvine) **Neural excitability after paradoxical sleep deprivation: A replication and further examination.** *Physiological Psychology*, 1975(Jun), Vol 3(2), 137-140.—Explored the relationship between paradoxical sleep (PS) deprivation and memory, using 128 mice as Ss. Mice that were deprived of PS for 3 days and given ECS at 1 of several intervals after PS deprivation, displayed a reduction in brain-seizure thresholds. Brain-seizure thresholds were invariant in comparable groups of Ss that were not deprived of PS. A shortening of the tonic phase of the convulsion also was observed in the PS-deprived Ss. These findings suggest that PS-deprived animals receiving compensatory brain stimulation underwent a less severe convulsion than controls. Results are interpreted to suggest that PS deprivation produces a central-neural change, during which time the brain is much more susceptible to agents that produce amnesia. (24 ref)—*Journal abstract*.

2032. Kennedy, Michael C. (New York U, Medical School) **Vocalization elicited in a lizard by electrical stimulation of the midbrain.** *Brain Research*, 1975, Vol 91(2), 321-325.—Outlines midbrain sites relevant to vocalization in a squamate, the Tokay gecko (*Gekko gecko* L.), a nocturnal lizard from the Far East. The midbrain vocalization sites appear to be related to the production of vocalizations of threat and/or alarm. 3 vocalization categories are described.

2033. Oniani, T. N.; Koridze, M. G.; Kavkasidze, M. G. & Gvetadze, L. B. (Georgian Academy of Sciences, Inst of Physiology, Tbilisi, USSR) **Effects of electrical stimulation of the mesencephalon and diencephalon on the paradoxical phase of sleep.** *Acta Neurobiologiae Experimentalis*, 1975, Vol 35(4), 323-342.—During paradoxical sleep (PS) electrical stimulation of the mesencephalic reticular formation and emotogenic structures in the mesencephalon and diencephalon of 15 adult cats produced depression or an increase in the theta rhythm of the hippocampal and entorhinal electrical activity. Stimulation not involving behavioral arousal did not cause a transition from PS into slow-wave sleep. The

cessation of stimulation restored the normal structure of PS. Stimulation of the reticular formation, causing the depression of the hippocampal and entorhinal theta rhythm without behavioral arousal did not affect duration of PS. It was shortened, however, by electrical stimulation of the emotiogenic structures evoking an increase in the hippocampal and entorhinal theta rhythms. Stimulation of ventromedial hypothalamus or septum (during wakefulness-inhibiting motivational behavior and emotional stress) caused transition from PS into slow-wave sleep. This is probably caused by a decrease in emotiogenic stress, which during PS is usually on a high level. (45 ref)—*Journal abstract*.

Lesions

2034. Chivileva, I. M. (Zhdanov State U, Leningrad, USSR) [Participation of the occipital cortical areas in recognition of short visual stimuli.] (Russ) *Zhurnal Vyssheĭ Nervnoĭ Deyatel'nosti*, 1974(Jan-Feb), Vol 24(1), 80-86.—Studied the effect of lesions produced by ablation in 9 cats of the occipital cortical area on the critical time of recognition of visual images. A conditioned reflex paradigm was used based on presentation of visual stimuli paired with sound stimuli. The noise presented along with the visual stimuli considerably prolonged critical time of recognition. Results show that ablation of both the striate and parastriate cortex markedly increased the critical time for recognition of visual images. The specific role of the cortical-occipital areas in visual recognition under conditions of a time deficit is discussed. (English summary) (21 ref)—*Journal abstract*.

2035. Dabrowska, Jadwiga. (Nencki Inst of Experimental Biology, Warsaw, Poland) **Prefrontal lesions and avoidance reflex differentiation in dogs.** *Acta Neurobiologiae Experimentalis*, 1975, Vol 35(1), 1-15.—Investigated the effects of bilateral partial prefrontal lesions on go-no-go differentiation with symmetrical or asymmetrical reinforcement trained by the avoidance procedure in 16 dogs. Moderate impairment of the tasks was observed after large lateral or medial prefrontal lesions, while severe deficits were obtained after a deep incision of the fibers in the specific prefrontal region. It is suggested that the mechanism of avoidance differentiation is of a symmetrical type, which is directly related to "motor act adifferentiation" but not to drive-no-drive differentiation. (23 ref)—*Journal abstract*.

2036. Davison, Catherine; Lowther, Wayne R. & Allen, Joseph-D. (U South Carolina) **Effect of septal lesions on behavioral contrast.** *Physiological Psychology*, 1975(Jun), Vol 3(2), 179-182.—5 male hooded rats with septal lesions and 5 control animals were tested on a multiple schedule. When extinction was instituted in 1 component of the multiple schedule, septal-lesioned and control Ss exhibited approximately equal amounts of positive contrast in the unaltered component. Results are discussed in terms of the situation specificity of the enhanced reaction to nonreward associated with septal damage. —*Journal abstract*.

2037. Dickinson, Anthony & Morris, R. G. (U Sussex, Lab of Experimental Psychology, Brighton, England) **Conditioned acceleration and free-operant wheel-turn avoidance following septal lesions in rats.** *Physiological*

Psychology, 1975(Jun), Vol 3(2), 107-112.—Studied free-operant wheel-turn avoidance performance of 10 male hooded rats with septal lesions and 10 sham-operated controls. Septal damage decreased the overall response and shock rates and the vigor of the burst pattern of responding. Both groups of Ss were then given a series of Pavlovian conditioning trials in a separate apparatus. During these sessions, a 5-sec tone was followed by an unavoidable shock on half of the trials and by a 5-sec light stimulus on the remaining trials. Subsequently these stimuli were presented while Ss responded on the free-operant wheel-turn avoidance schedule. The magnitude of the response-rate acceleration produced by the tone was unaffected by the lesion. The light did not develop rate-inhibiting properties in either group of Ss. These results provide no evidence that septal damage attenuates Pavlovian fear conditioning. (32 ref)—*Journal abstract*.

2038. Dru, Denise; Walker, Judith B. & Walker, James P. (Huntington Inst of Applied Medical Research, Pasadena, CA) **Recovery of pattern vision following serial lesions of striate cortex in rats.** *Brain Research*, 1975, Vol 88(2), 353-356.—4 groups of adult male Long-Evans rats were tested for their ability to discriminate horizontal-vertical patterns, were given 2-stage lesions of the striate cortex, and were retested for their visual pattern discrimination ability. Results show that Ss given 2-stage serial lesions of the visual cortex demonstrated recovery of pattern vision postoperatively and extend findings of earlier studies of visual serial lesion effects to behavioral functions mediated more specifically within the visual cortex. (19 ref)

2039. Dryagin, Yu. M. & Mikhailov, A. V. (USSR Academy of Sciences, Pavlov Inst of Physiology, Leningrad) [Participation of neurons in the rostral part of the head of the nucleus caudatus in the formation of a defensive conditioned reflex.] (Russ) *Zhurnal Vyssheĭ Nervnoĭ Deyatel'nosti*, 1974(Jan-Feb), Vol 24(1), 64-73.—Studied the effect of frequency-temporal structure of background activity and changes in the process of extinction on the orienting reflex to sound in 10 cats. Ss were operated on prior to receiving defensive conditioning (experimental phase, post-operatively). Results show that the rostral part of the head of the caudate nucleus (dorsal neuronal segment) plays an active part in the defensive conditioning mechanism forming the reflex. 3 types of conditioned reorganizations of the unit responses were presented in histogram form. The role of dorsal caudate nucleus neurons in the formation of a defensive conditioned reflex is discussed. (English summary) (35 ref)—L. V. Majovski.

2040. Frumkin, Kenneth. (Hahnemann Medical Coll, Philadelphia, PA) **Effects of deprivation schedule on the maintenance of a preoperative salt aversion by adrenalectomized rats.** *Physiological Psychology*, 1975(Jun), Vol 3(2), 101-106.—Attempted to quantify the amount of preoperatively-established salt aversion which influences sodium-specific hunger in adrenalectomized male albino rats. Ss that had learned a conditioned taste aversion to sodium chloride were subsequently adrenalectomized or sham-operated. In Exp I, all Ss had 1 hr of daily access to a salt solution and water postoperatively. Most of the adrenalectomized Ss maintained their aversions postop-

eratively and died. In Exp II, the effects of the preoperative aversions were all but eliminated in adrenalectomized Ss by giving ad lib access to sodium and water postoperatively. It is concluded that modifiability of the sodium appetite can be demonstrated only under restricted deprivation conditions. (22 ref)—*Journal abstract*

2041. Hilger, William N. & Rowe, Frank A. (Illinois Inst of Technology) Olfactory bulb ablation: Effects on handling reactivity, open field behavior, and agonistic behavior in male and female hamsters. *Physiological Psychology*, 1975(Jun), Vol 3(2), 162-168.—Studied the relationship between an animal's sex and the behavioral effects of olfactory bulb ablation. Bilateral ablation resulted in increased handling reactivity, and decreased open-field ambulation and intraspecific aggressiveness in male and female hamsters. Bulbectomy-induced increases in handling reactivity were greater in female than in male hamsters. However, bulbectomy-induced deficits in open-field ambulation and aggressive behavior were greater in males than in females. Bulbectomy-induced increases in handling reactivity were transient in both sexes. Furthermore, bulbectomized females regained preoperative levels of open-field ambulation by the 2nd postoperative week. In contrast, bulbectomized males exhibited levels of open-field ambulation that were below preoperative levels in all but the 3rd postoperative week. In bulbectomized males, aggressiveness was suppressed for the duration of postoperative testing. (28 ref)—*Journal abstract*.

2042. Hunter, M.; Ettlinger, G. & MacCabe, J. J. (Inst of Psychiatry, London, England) Intermanual transfer in the monkey as a function of amount of callosal sparing. *Brain Research*, 1975, Vol 93(2), 223-240.—Examined the effects of commissure section, task difficulty, and overtraining on the intermanual transfer of tactile learning in 4 groups of 21 rhesus monkeys. One group was subjected to complete transection of the corpus callosum, massa intermedia, and posterior commissure. Some Ss in this group also sustained a cerebellar section. A 2nd group received a similar division of the commissures but with part of the posterior body of the corpus callosum left intact. A 3rd group received similar division of the commissures but with the posterior commissure left intact. The 4th group formed an unoperated control group. Ss with only the posterior commissure left intact showed little or no transfer. Ss with partial callosal lesions showed significantly greater transfer than animals with total transections, but were impaired relative to the unoperated controls. The correlation between transfer and the number of callosal fibers left intact in Ss with partial callosal lesions was significant on only 1 task. Neither task difficulty nor overtraining significantly affected transfer. (15 ref)—*Journal abstract*.

2043. Iwahara, Shinkuro & Kato, Kyoko. (Tokyo U of Education, Japan) Effects of olfactory bulb lesions on the orienting response to auditory stimulation in drinking rats. *Brain Research*, 1975, Vol 88(3), 565-567.—To study whether bilateral olfactory bulb lesions have disruptive effects on auditory orienting responses (OR), 22 male Wistar rats were water deprived for 7 days and were then presented with 5 tones of different frequencies

as a test of OR. Results support those of previous studies of medial septal and hippocampal lesions in that the OR to auditory stimulation was reduced in lesioned Ss when they were highly motivated for a particular task (drinking).

2044. Kalil, Katherine. (U Wisconsin, Madison) A study of so-called "retrograde fine-grain" degeneration in the thalamus. *Brain Research*, 1975, Vol 93(2), 189-202.—Following lesions of the neocortex a uniform dust-like silver deposit may appear in certain thalamic nuclei stained with the Nauta or Fink-Heimer methods. Because this deposit lacks the characteristic morphology of axons undergoing Wallerian degeneration and often appears in regions of retrograde cell degeneration, it has been interpreted as a retrograde reaction. In cats with lesions of the posterior cingulate and presubicular cortex the Fink-Heimer method showed the fine-grain silver deposit in the lateralis dorsalis (LD) and the anteroventral nucleus (AV). After the survival times used (6-8 days) no retrograde perikaryal changes were seen in these nuclei. In other cats, 3 wks after injections of radioactive proline in the posterior cingulate cortex, the distribution of the label in the LD and AV nuclei was almost identical to the distribution of the "dust" in the Fink-Heimer sections. Since the autoradiographic method used reveals anterograde transport, it appears that both methods are demonstrating corticofugal axons. It is suggested that the "fine grain" degeneration arises from an anterograde, not a retrograde, reaction. (23 ref)—*Journal abstract*.

2045. Kelly, Peter H.; Seviour, Paul W. & Iversen, Susan D. Amphetamine and apomorphine responses in the rat following 6-OHDA lesions of the nucleus accumbens septi and corpus striatum. *Brain Research*, 1975, Vol 94(3), 507-522.—In a study with 36 male albino Sprague-Dawley rats, 8 µg of 6-hydroxydopamine (6-OHDA) injected bilaterally into the nucleus accumbens septi (NAS) or the caudate nucleus resulted in 79% and 50% depletion of endogenous dopamine (DA) at these respective sites. 14 days later, 1.5 mg/kg ip of dextroamphetamine failed to induce the characteristic locomotor response in the NAS-lesioned Ss but did so in the caudate-lesioned Ss. The caudate lesion, but not the NAS lesion, abolished intense forms of stereotyped behavior induced by higher doses of amphetamine (5mg/kg). Both lesioned groups exhibited supersensitivity to apomorphine (1 mg/kg); the NAS group showed enhanced locomotor activity and the caudate group enhanced stereotyped behavior. These effects were maximal at 14 days postoperatively and were attenuated at 90 days. There was evidence that remaining DA levels in the NAS were greater at 90 than at 14 days postoperatively. Thus recovery of behavioral effects correlated with an increase in the remaining levels of DA in the NAS. (35 ref)—*Journal abstract*.

2046. Kharchenko, P. D. & Lipetskaya, A. N. (Kiev State U, Inst of Physiology, USSR) [The role of various analyzers in the recovery of the spatial-motor conditioned reflexes in hens.] (Russ) *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1974(Jan-Feb), Vol 24(1), 87-94. Studied the effects of ablated peripheral ends of the vestibular and visual analyzer on the functions of visual, proprioceptive, and tactile analyzers in 40 hens. Stage by stage

removal of receptors extended subsequent compensatory activity of retained analyzers. Activity of the remaining receptor produced compensatory enhancement of interaction between its central and other analyzer systems. Motor spatial stereotype achieved due to joint activity of analyzers on the basis of their complex interaction in hen's brain is discussed. (English summary) (30 ref.) *V. Majovski.*

2047. Kulkosky, Paul J.; Moe, Karen E.; Woods, Stephen C. & Riley, Anthony L. (U Washington, Seattle) **Effect of ventromedial hypothalamic lesions on schedule-induced polydipsia.** *Physiological Psychology*, 1975 (Jun), Vol 3(2), 172-174.—8 male hooded rats with bilateral electrolytic lesions of the ventromedial hypothalamus were maintained at either 80% of their preoperative lean weights or 80% of their postoperative obese weights. Unlike the 4 sham-operated rats maintained at 80% of their weights, neither group of lesioned rats acquired schedule-induced polydipsia after 15 daily 1-hr sessions on a free variable-interval 1-min food schedule with water continuously available. Results are consistent with previous findings of reduced drinking responses of ventromedially lesioned rats to a variety of conditions which increase drinking in normal rats. (24 ref)—*Journal abstract.*

2048. Lagowska, Jadwiga & Fonberg, Elzbieta. (Nencki Inst of Experimental Biology, Warsaw, Poland) **Salivary reactions in dogs with dorsomedial amygdala lesions.** *Acta Neurobiologiae Experimentalis*, 1975, Vol 35(1), 17-26.—Established conditioned salivary reactions reinforced by food in 10 dogs with chronic parotid fistulas. After bilateral lesions of the dorsomedial part of the amygdaloid complex, conditioned salivary reactions were greatly diminished, and unconditioned salivation decreased as well. This finding was greater in Ss that revealed the entire syndrome of amygdaline aphagia, but it was also evident in hypophagic dogs. In several dogs, a disinhibition of salivation to negative CSs was also observed. Results show that the dorsomedial amygdala, like the lateral hypothalamus, is involved in the regulation of salivary reactions. (21 ref)—*Journal abstract.*

2049. Lanier, Linda P.; Petit, Ted L. & Zornetzer, Steven F. (U Florida, Ctr for Neurobiological Science) **Discrete anterior medial thalamic lesions in the mouse: The production of acute postoperative hyperactivity and death.** *Brain Research*, 1975, Vol 91(1), 133-139.—Presents behavioral findings regarding the effects of discrete electrolytic lesions in the anterior medial thalamic regions of 43 adult male Swiss mice. Data suggest that these thalamic regions play an important role in the maintenance and regulation of tonic forebrain-hind-brain interactions. (20 ref)

2050. Lepore, Franco; Cardu, Bruno; Rasmussen, Theodore & Malm, Robert B. (U Montréal, Québec, Canada) **Rod and cone sensitivity in destriate monkeys.** *Brain Research*, 1975, Vol 93(2), 203-221.—Determined photopic and scotopic spectral sensitivity of 4 rhesus monkeys before and after complete removal of the striate cortex. Ss were required to choose between a white and a series of monochromatic stimuli distributed throughout the visible spectrum. A modified method of limits was used to determine the psychophysical point of subjective equality at which the colored and white lights were

perceived as being equally bright. One human S was tested to assess this method's validity. The method of testing was found to be appropriate to determine spectral sensitivity since the curves obtained compared favorably to the theoretical sensitivity curves. Postoperatively, the scotopic sensitivity curve was normal whereas the photopic curve was completely displaced towards the scotopic curve. Results indicate that cone information is processed by the geniculo-striate visual system whereas the extra-striate structures receive their input mainly from the rod receptors of the retina. (38 ref)—*Journal abstract.*

2051. Lukaszewska, Irena. (Nencki Inst of Experimental Biology, Warsaw, Poland) **Delayed responses of the kinesthetic type following frontomedial lesions.** *Acta Neurobiologiae Experimentalis*, 1975, Vol 35(4), 351-360.—Returning behavior was tested before and after frontomedial surgery in 2 experiments using 24 and 16 male Wistar rats. Ss had to go for food and return to the starting place by the same route in an elevated T maze. The correct return response required the immediate retention of the turn performed on the way to food. Subtotal, although considerably large, lesions of the frontomedial cortex (Exp I) had no effect on performance. Lesions covering almost the entire area between the tip of the pole and genu of the corpus callosum (Exp II) decreased performance almost to the chance level, and no improvement was observed during 30 sessions. (16 ref)—*Journal abstract.*

2052. Markowska, Alicja & Lukaszewska, Irena. (Nencki Inst of Experimental Biology, Warsaw, Poland) **Short-term memory of spatio-visual events preserved after frontomedial or frontopolar lesions in rats.** *Acta Neurobiologiae Experimentalis*, 1974, Vol 34(6), 715-721.—42 male Wistar rats with frontomedial or frontopolar lesions and 42 sham operated and unoperated controls were allowed to inspect but not to enter the arms of a white-black enclosed T-maze. Subsequently, the color of one arm was changed to the opposite one, and Ss were presented with a free choice of maze arms. All groups showed a preference for the changed arm, displaying retention of position of visual cues. It is concluded that frontal areas in rats are not involved in the short-term memory of the localization of visual cues.—*Journal abstract.*

2053. Mering, T. A. & Mukhin, E. I. (USSR Academy of Medical Sciences, Brain Inst, Moscow) **[The influence of ablation of the temporal cortical area on time interval count.]** (Russ) *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1974 (Jan-Feb), Vol 24(1), 3-9.—Studied the effect of ablation of the temporal cortex area in 6 dogs who received alimentary conditioned reflex training. Conditioning was assessed by the S's movement to a feeding trough. Temporal responses were first demonstrated on the basis of stimuli applied on a fixed schedule of time intervals; successive signals were then omitted in the experimental paradigm. Ss began to gradually respond in conditions of net time without the application of stimuli. Results show that ablation did not affect the Ss' ability to differentiate between count intervals of time (e.g., 30 sec, 1, 2, and 5 min). The organism's capability of reversing conditioned reflexes to time by switching over and

making temporal discriminations are discussed. (English summary) (23 ref)—*L. V. Majovski.*

2054. **Miller, S.; Van der Burg, J. & Van der Meché, F. G.** (Erasmus U, Rotterdam, Netherlands) **Coordination of movements of the hindlimbs and forelimbs in different forms of locomotion in normal and decerebrate cats.** *Brain Research*, 1975, Vol 91(2), 217-237.—Analyzed the coupling of movements of the hindlimbs and forelimbs in intact cats stepping over ground and on a treadmill and during swimming, and in decerebrate cats stepping on a treadmill, immersed in water (swimming) and stepping suspended in the air. Results provide further support for the hypothesis of 2 basic forms of interlimb coupling in which long propriospinal pathways probably play a role. (46 ref)

2055. **Passingham, Richard.** (U Oxford, England) **Delayed matching after selective prefrontal lesions in monkeys (*Macaca mulatta*).** *Brain Research*, 1975, Vol 92(1), 89-102.—9 rhesus monkeys with bilateral lesions of either dorsal or ventral prefrontal cortex were tested on delayed matching for colors. Ss with dorsal frontal lesions performed as well after the operation as before, whereas those with ventral frontal lesions were severely impaired even at the shortest delay. However, Ss with dorsal frontal lesions failed to learn delayed spatial alternation. Results support the view that the Ss with dorsal frontal lesions had an impairment in memory for spatial cues or their own movements in space. (23 ref)—*Journal abstract.*

2056. **Pigareva, M. L.** (USSR Academy of Sciences, Inst of Higher Nervous Activity & Neurophysiology, Moscow) **[The role of the amygdaloid complex in conditioned switching-over in rats.]** (Russ) *Zhurnal Vyssheĭ Nervnoĭ Deyatel'nosti*, 1974(Jan-Feb), Vol 24(1), 25-32.—Studied the effect of bilaterally injured amygdalas on alimentary and defensive conditioned reflexes in 10 white rats. 8 intact Ss served as controls. The switching-over stimulus consisted of the time of day and lighting conditions of the experimental room. Results show that operated Ss demonstrated switching-over less readily than the intact group. The hypothesis that the amygdala plays an important part in the organization of interactions between the coexisting reflex systems and forms part of the brain substrate of the interfering mechanism of emotion is discussed. (English summary) (31 ref)—*L. v. Majovski.*

2057. **Polakova, A. G.** (USSR Academy of Medical Sciences, Brain Inst, Moscow) **[Comparative analysis of early evoked potentials in the motor and parietal areas.]** (Russ) *Zhurnal Vyssheĭ Nervnoĭ Deyatel'nosti*, 1974(Jan Feb), Vol 24(1), 138-146.—Studied early responses of the motor cortex of cats under nembutal anesthesia when motor and sensory areas were disconnected (experimental group) and left intact (control group). When cutting of white matter was performed on the motor cortex, early responses disappeared. Results of the experimental group with paired stimulation of one or of different sensory systems show that different afferent impulses came to the motor cortex along autonomous pathways suggesting the origin of early responses of the motor cortex. (English summary) (33 ref)—*L. V. Majovski.*

2058. **Rosenkilde, Carl E. & Divac, Ivan.** (NIMH, Bethesda, MD) **DRL performance following anteromedial cortical ablations in rats.** *Brain Research*, 1975, Vol 95(1), 142-146.—Previous findings have indicated that anteromedial ablations cause deficient performance in rats on tasks involving spatial cues or choices, go-no-go alternations, and active avoidance. The present study determined whether this syndrome following injury of the anteromedial cortex included impaired performance in a DRL situation. 4 male Wistar rats first received continuous reinforcement training and were then shifted to a DRL-10 schedule until they attained an efficiency ratio of at least 50% in each of 5 successive sessions. Ss then received anteromedial ablations and were retested on the DRL-10 schedule. Performance deteriorated in all Ss after operation. It is concluded that the anteromedial cortex also subserves behavior in a situation which is not characterized by spatially differentiated stimuli or responses. (23 ref)—*L. Gorsev.*

2059. **Stepień, Irena.** (Nencki Inst of Experimental Biology, Warsaw, Poland) **Effects of prefrontal lesions on left leg-right leg differentiation to nondirectional acoustic cues in dogs.** *Acta Neurobiologiae Experimentalis*, 1975, Vol 35(4), 343-349.—25 mongrel dogs were trained preoperatively in left-leg-right-leg differentiation to nondirectional acoustic cues. Removal of the medial precruciate cortex as well as the preoral or orbital cortex together with underlying fibers did not affect performance of the task, whereas lesions which involved the fibers underlying the medial precruciate cortex produced more or less pronounced, yet moderate, impairment. Comparison between this impairment and that obtained following similar lesions in an earlier experiment with directional cues, indicates that fibers underlying the medial precruciate cortex are of greater importance when directional cues are involved in the task.—*Journal abstract.*

2060. **Wells, M. J. & Young, J. Z.** (U Cambridge, England) **The subfrontal lobe and touch learning in the octopus.** *Brain Research*, 1975, Vol 92(1), 103-121.—Octopuses with the supra-esophageal lobes of the brain divided longitudinally can be taught to discriminate using the arms on either side. If there is no further lesion the 2 sides behave alike. Data are presented from 3 experiments with 43 Ss which show that (a) lesions limited to one side did not affect the performance of the contralateral, "control," side; and (b) lesions made in the vertical lobes led to a slight drop in performance in training to take a smooth sphere, in discrimination training (rough vs smooth spheres), and in extinction and transfer tests. After removal of the median inferior frontal lobe there were somewhat greater effects in the same direction. Removal of parts from the subfrontal lobe always led to a marked loss of capacity for touch learning, broadly dependent on the amount of tissue removed. Removal of the whole subfrontal lobe produced Ss with only very slight signs of learning. Such animals can adjust their overall level of response as a result of training but they seem incapable of adjusting response levels to 2 objects independently. (18 ref)

Drug Stimulation & Psychopharmacology

2061. Avis, Harry H. & Peeke, Harman V. (U California, Langley Porter Inst, San Francisco) **Differentiation by morphine of two types of aggressive behavior in the convict cichlid (*Cichlasoma nigrofasciatum*).** *Psychopharmacologia*, 1975, Vol 43(3), 287-288.—In an experiment with 8 male convict cichlids, morphine sulfate (5 and 10 mg/l) significantly decreased the amount of territorial aggression. The same doses had no effect on predatory aggression (ingestion of brine shrimp). Data suggest that the previously demonstrated morphine receptor in the fish has functional properties. —*Journal abstract.*
2062. Baran, Avi; Shuster, Louis; Eleftheriou, Basil E. & Bailey, Donald W. (Tufts U, Medical School, Boston) **Opiate receptors in mice: Genetic differences.** *Life Sciences*, 1975(Aug), Vol 17(4), 633-640.—In C57/6By, BALB/cBy, their reciprocal F₁ hybrids, and 7 recombinant-inbred strains of mice, differences in stereospecific binding of naloxone reflected a difference in total number of receptor sites. The recombinant-inbred strains also differed in their analgesic response to morphine. Results indicate different genetic controls for the 2 parameters; at least 2 genetic determinants may be involved in regulating the level of opiate receptors. (22 ref)
2063. Barker, Jeffrey L. (NIH, National Inst of Child Health & Human Development, Behavioral Biology Branch, Bethesda, MD) **CNS depressants: Effects on post-synaptic pharmacology.** *Brain Research*, 1975, Vol 92(1), 35-55.—Studied the effects of 5 anesthetics (chloralose, chloroform, ethanol, pentobarbital, and urethane) and 1 anticonvulsant (diphenylhydantoin) on the membrane properties and postsynaptic responses of crustacean neuromuscular junction preparations and molluscan neurons to putative transmitters and peptides. Data suggest that much of the depression of neuronal excitability observed with these CNS depressants is due to a selective postsynaptic depression of the Na⁺-K⁺-dependent conductance mechanism coupled to postsynaptic receptors. (70 ref)
2064. Barker, Jeffrey L. (NIH, National Inst of Child Health & Human Development, Bethesda, MD) **Inhibitory and excitatory effects of CNS depressants on invertebrate synapses.** *Brain Research*, 1975, Vol 93(1), 77-90.—Studied the effects of pentobarbital on membrane properties and synaptic activity of crustacean neuromuscular junction preparations and molluscan neurons. Lobsters, crayfish, *Aplysia californica* (sponge), and snails were used. Results show that (a) pentobarbital selectively depressed in a dose-dependent, reversible manner the excitatory postsynaptic potentials (EPSPs) recorded at crustacean neuromuscular junctions without altering either inhibitory postsynaptic potentials (IPSPs) or postsynaptic membrane properties; (b) pentobarbital depressed cholinergic EPSPs in molluscan neurons and depressed only the depolarizing (vs the hyperpolarizing) phase of a biphasic postsynaptic potential; (c) the reversal potentials of the EPSP and the IPSP were not altered by pentobarbital; (d) low concentrations of pentobarbital did not alter spontaneously occurring IPSPs, while high concentrations changed the pattern of regular IPSP input to an irregular, burst-like pattern; and (e) pentobarbital and 4 other CNS depressants (chloralose, chloroform, ethanol, and urethane) increased the excitability and altered the current-voltage relations of a cell whose membrane properties appear to be a model of presynaptic terminal membranes. Results shed light on the cellular basis of the depressant and excitatory effects of these agents. (68 ref)—*Journal abstract.*
2065. Barth, R. H. et al. (U Texas, Austin) **Juvenile hormone promotes dominance behavior and ovarian development in social wasps (*Polistes annularis*).** *Experientia*, 1975, Vol 31(6), 691-692.—Repeated topical application of juvenile hormone to workers of the primitive social wasp resulted in a disruption of colony social structure, as indicated by a sharp increase in the frequency of dominance interactions. Ovarian maturation was also observed, probably as both a direct and an indirect effect of hormone treatment. —*Journal summary.*
2066. Bennett, James P. & Snyder, Solomon H. (Johns Hopkins U, Medical School) **Stereospecific binding of D-lysergic acid diethylamide (LSD) to brain membranes: Relationship to serotonin receptors.** *Brain Research*, 1975, Vol 94(3), 523-544.—In a study with adult male Sprague-Dawley rats and rhesus monkeys, dextro-[³H] LSD was found to bind saturably, reversibly, and with a high affinity to rat brain membranes. The association and dissociation rates of binding were temperature dependent and fastest at 37° C. Binding was enriched in crude microsomal (P₃) membranes. Dextro-[³H] LSD binding was stereospecific as levo-LSD, the psychotropically inactive enantiomer, was 1,000 times weaker than dextro-LSD as a displacing agent. The potencies of other LSD analogs paralleled their psychotropic activity with the exception of 2-bromo-LSD (psychotropically inactive) which was as potent as dextro-LSD in displacing bound dextro-[³H] LSD. Serotonin was the only putative neurotransmitter with affinity for the LSD binding site, and psychotropically active alkylindoleamines were also potent displacing agents. Destruction of presynaptic serotonin neuronal elements by lesioning the midbrain raphe nuclei did not change the affinity or maximum number of detectable in vitro dextro-[³H] LSD binding sites. The regional distribution in monkey brain of dextro-[³H] LSD binding and high affinity [³H] serotonin uptake, a marker for pre-synaptic serotonin nerve terminal density, showed some correlation. The most notable exceptions were cerebral cortical areas which were highest in dextro-[³H] LSD binding and only intermediate in [³H] serotonin uptake. Evidence suggests that dextro-[³H] LSD binds to postsynaptic serotonin receptors. (47 ref)—*Journal abstract.*
2067. Beuthin, F. C.; Miya, T. S.; Blake, D. E. & Bousquet, W. F. (Purdue U, School of Pharmacy & Pharmacal Sciences) **Enhanced sensitivity to noradrenergic agonists and tolerance development to α-methyl-tyrosine in the rat.** *Journal of Pharmacology & Experimental Therapeutics*, 1972, Vol 181(3), 446.—Chronic ip administration of α-methylparatyrosine (AMT) every 12 hrs, together with AMT methyl ester in the drinking water, to male rats resulted in tolerance to the spontaneous motor activity depressant and antiamphetamine effects of AMT. This tolerance developed while brain levels of catecholamines remained maximally depressed. Increased sensitivity to the hyperthermic effect of

subcutaneous dextroamphetamine sulfate and increased motor activity were observed in Ss 30 hrs after withdrawal of AMT after a 13-day treatment. The increased sensitivity to amphetamine was not the result

of elevated plasma levels of amphetamine. AMT tested in AMT-treated and control Ss. On withdrawal from a 13-day AMT treatment, Ss exhibited enhanced sensitivity to the hypothermic effect of *iv* norepinephrine but not to the hypothermic effect of *iv* amphetamine. It is concluded that the chronic administration of AMT to the rat results in increased sensitivity of noradrenergic systems to both amphetamine and norepinephrine and that the administration of amphetamine to the CNS to such compounds may be a valuable tool in delineating central functions such as thermoregulation and the mechanism of action of centrally active drugs.

2068 Cox, Raymond H. & Maickel, Roger P. (Mead Johnson Research Ctr, Evansville, IN) Comparison of anorexic and behavioral potency of phenylethylamines. *Journal of Pharmacology & Experimental Therapeutics*, 1972, Vol 181(1), 1-9.—Measured in rats the depression of hunger-induced food intake and effects on avoidance responding caused by compounds containing a phenylethylamine structure. All of the compounds tested reduced food intake in hungry Ss. Fenfluramine and para-chloroamphetamine were the most potent, with molar potencies $\frac{1}{2}$ greater than that of amphetamine. The least potent was para-hydroxyamphetamine, with a molar potency less than 6% that of amphetamine. In the behavioral tests, the majority of the compounds increased the rate of avoidance responding, with the most potent one, methamphetamine, having a molar potency 3 times that of amphetamine. The least potent was phendimetrazine, with a molar potency $\frac{1}{10}$ that of amphetamine. Fenfluramine, para-methylamphetamine, and para-chlorobenzphetamine were depressant in action, whereas chlorphentermine, benzphetamine, and para-hydroxyamphetamine had no significant effects on avoidance responding.—*Journal abstract*.

2069 Daniels, J. D. & Pettigrew, J. D. (California Inst of Technology, Div of Biology) A study of inhibitory antagonism in cat visual cortex. *Brain Research*, 1975, Vol 93(1), 41-62.—Tested the effects of alkaloid bicuculline, an antagonist of gamma-aminobutyric acid (GABA), on the response properties of visual cortex neurons in adult cats, using a computer-controlled stimulus presentation system to quantitatively assess the changes in receptive field organization after drug treatment. It is concluded that a class of stellate cells, using GABA, is a likely candidate for the transmitter of some intracortical inhibition. (48 ref)

2070. Daskalopoulos, N.; Schmitt, H. & Laubie, M. [Effects of delta-9-tetrahydrocannabinol on central cardio-vascular control: Mechanism and site of action.] (Fren) *Encephale*, 1975(Feb), NS Vol 1(2), 121-132.

Reports that delta-9-tetrahydrocannabinol (30-300 mg/kg *iv*) induced in dogs and cats a decrease in blood pressure and heart rate. The mechanism of this decrease in the sympathetic tone appears to be different from the mechanism of reduction induced by clonidine or by

barbitic analgesic agents. The main site of reactions appears to be in the medulla oblongata. (K J Harman)

2071 Drewowski, Adam & Gray, Jeffrey A. (Rockefeller U, New York, NY) Influence of Δ^9 -tetrahydrocannabinol on partial reinforcement effects. *Psychopharmacologia*, 1975, Vol 43(3), 233-237.—Conducted 2 experiments with a total of 64 male Wistar rats trained with either continuous reinforcement (food) or random 50% partial reinforcement for running in a straight alley. Half the Ss were trained with daily injections of 0.5 mg/kg Δ^9 -tetrahydrocannabinol (THC) and half with vehicle injections, all Ss being extinguished with vehicle injections in Exp I and with THC injections in Exp II. The partial reinforcement acquisition effect was abolished by THC during training; the partial reinforcement extinction effect was abolished by THC either during training or during extinction. In these respects THC resembles amylorbarbitone and alcohol. (16 ref)—*Journal abstract*.

2072. Drucker-Colin, René R. & Giacobini, Ezio. (Universidad Nacional Autonoma de Mexico, Inst de Biologia, Mexico City) Sleep-inducing effect of piperidine. *Brain Research*, 1975, Vol 88(1), 186-189.—Reports behavioral and electrophysiological results of perfusion of piperidine with a push-pull cannula system into portions of the brain stem in 16 anesthetized cats. Findings appear to demonstrate the first pharmacological evidence for a direct hypnogenic effect of piperidine in the CNS and suggest a possible involvement of piperidine in the physiological processes of sleep and hibernation. (19 ref)

2073. Gispén, Willem H.; Wiegant, Victor M.; Greven, Henk M. & de Wied, David. (U Utrecht, Medical Faculty, Inst of Molecular Biology, Netherlands) The induction of excessive grooming in the rat by intraventricular application of peptides derived from ACTH: Structure-activity studies. *Life Sciences*, 1975(Aug), Vol 17(4), 645-652.—Intraventricular administration of synthetic ACTH-like peptides in the rat induces excessive grooming, stretching, and yawning. The present study with male Wistar rats demonstrated that induction of excessive grooming is dose-dependent and independent of the endocrine system. Structure-activity studies showed that ACTH_{1-16}}, ACTH₁₋₁₆-NH₂, ACTH_{1-16}}, and α and β melanocyte stimulating hormones were equipotent. Although the presence of the sequence ACTH_{1-16}} in the peptides studied seemed important in the induction of excessive grooming, it appeared that C-terminal elongation was necessary for the expression of the activity. Administration of [D-Phe⁷] ACTH_{4-10}} and [D-Phe⁷] ACTH_{1-16}} resulted in appreciable grooming activity. However, substitution of a D-arginine at the 8 position did not alter the activity of ACTH_{1-16}}. The structure-activity relationship of these peptides on grooming activity of the rat is compared to that known for retardation of avoidance extinction. Although some similarities exist, it is concluded that excessive grooming and retardation of avoidance activity are mediated through different mechanisms. (21 ref)—*Journal abstract*.

2074. Golub, Mari & Kornetsky, Conan. Modification of the behavioral response to drugs in rats exposed prenatally to chlorpromazine. *Psychopharmacologia*, 1975, Vol 43(3), 289-291.—Female CD rats exposed prenatally to low levels of chlorpromazine (CPZ) were

less susceptible to the effects of the following doses of CPZ (1 and 2 mg/kg) and pentobarbital (6 and 10 mg/kg) on PPI performance. (18 ref) —*Journal abstract*

2075. Grilly, David M. (Cleveland State U) Effects of prior experience on differential learning under amphetamine. *Psychopharmacologia*, 1975, Vol 43(3), 271-277. —48 male Fischer albino rats were given varying amounts of nondrug acquisition training on a response-duration differentiation task before being given extended training under 0.75 mg/kg dextroamphetamine. All Ss were then tested under nondrug conditions. Amphetamine significantly enhanced performance, and this enhancement transferred to subsequent nondrug conditions. However if nondrug training occurred before drug training, this enhancement was greatly attenuated. Furthermore, only those behavioral components under which amphetamine led to an increase in reinforcement rate showed enhancement in the nondrug state. Results which support a drug-behavior reinforcement interaction explanation of differential learning of operant behavior under drug and nondrug states are discussed in relation to a "stimulus generalization decrement" explanation of differential learning under amphetamine. (24 ref) —*Journal abstract*

2076. Gromov, A. I. (Sechenov Inst of Medicine, Moscow, USSR) [Participation of cerebral cholinergic mechanisms in the action of neuroleptics.] (Russ) *Farmakologiya i Toksikologiya*, 1975(Mar-Apr), Vol 38(2), 145-148. Studied the effects of droperidol, haloperidol, ethaperazine (perphenazine) and chlorpromazine (all introduced ip at 5 mg/kg), and of benactyzine (1 mg/kg) and cyclodol (2.5 mg/kg), both introduced subcutaneously, on fearful and aggressive responses to painful electrical stimulation in pairs of mice. The neuroleptics, except chlorpromazine, markedly decreased the aggressive response, but had no effect on the fear response. All the neuroleptics also increased the activity of the m-cholinoreactive systems of the brain, although chlorpromazine produced only a marginal increase. Benactyzine and cyclodol, which block the central m-cholinoreceptors, reduced the anti-aggressive activity of the neuroleptics and eliminated their effect on the m-cholinoreactive systems. (English summary)—A. G. Pook.

2077. Holtzman, Stephen G. & Jewett, Robert E. (Emory U) Stimulation of behavior in the rat by cyclazocine: Effects of naloxone. *Journal of Pharmacology & Experimental Therapeutics*, 1973, Vol 187(2), 380-390.—Evaluated the actions of cyclazocine on 2 types of behavior: leverpressing maintained under a continuous avoidance schedule, and locomotor activity. The effects of cyclazocine on the total brain content of norepinephrine, dopamine, and serotonin were also examined. Dose response curves were determined for cyclazocine alone, then redetermined with concomitant administration of naloxone at 2 dose levels. Dextroamphetamine was tested alone and with naloxone. Cyclazocine increased avoidance responding and locomotor activity in a graded manner over a broad range of doses. Both behaviors were disrupted by the highest doses of cyclazocine. Cyclazocine lowered brain catecho-

lamine levels slightly. Naloxone attenuated the stimulant and disruptive effects of cyclazocine on avoidance behavior, but failed to block cyclazocine's effects on locomotor activity and brain catecholamine levels. (18 ref) —*Journal abstract*

disruption of avoidance behavior produced by a dose of that drug. Findings are consistent with the view that the agonistic component of action of some narcotic antagonists is mediated by several mechanisms, at least one of which is not blocked by naloxone. The interaction between these mechanisms is not clear. (18 ref) —*Journal abstract*

the need for further evaluation of possible interactions between narcotic antagonists and psychoactive drugs of classes other than the opiate. —*Journal abstract*

2078. Holtzman, Stephen G. & Jewett, Robert E. (Emory U) Some actions of pentazocine on behavior and brain monoamines in the rat. *Journal of Pharmacology & Experimental Therapeutics*, 1972, Vol 181(2), 346-356.—Studied the effects of pentazocine on continuous avoidance behavior, locomotor activity, and brain monoamines. Operant behavior was increased by 2-16 mg/kg pentazocine and decreased by 32 mg/kg. Both stimulant and depressant effects were antagonized by naloxone. 8-64 mg/kg pentazocine produced an increase in locomotor activity which was not prevented by as much as 16 mg/kg naloxone. Stimulation of motor activity was blocked by alpha-methyltyrosine. The total brain content of norepinephrine, dopamine, and serotonin was reduced by pentazocine; turnover rates were not affected. Depletion of catecholamines was 2%-3% times greater than did pentazocine and elevated brain levels of dopamine. Results show that (a) the actions of pentazocine on operant behavior appear to be independent of its effects on brain monoamines, (b) stimulation of locomotor activity by pentazocine may be related to release of brain monoamines, and (c) some of pentazocine's antagonistic effects are mediated by mechanisms distinct from those which mediate the actions of morphine. —*Journal abstract*

2079. Houser, Vincent P. (VA Hosp, Psychotropic Drug Lab, Perry Point, MD) The effects of Δ^9 -tetrahydrocannabinol upon fear-motivated behavior in squirrel monkeys. *Physiological Psychology*, 1975(Jun), Vol 3(2), 157-161.—Investigated the effects of 3 doses (4, 8, and 12 mg/kg) of delta-9-tetrahydrocannabinol (THC) upon the behavior of 6 squirrel monkeys subjected to a Sidman nondiscriminated avoidance schedule that superimposed conditioned stimuli (CS)—unavoidable shock pairings upon the ongoing avoidance behavior. All Ss demonstrated facilitated avoidance response rates and general motor activity during the aversive CS. Oral administration of THC produced avoidance decrements with a consequent increase in the number of shocks received only under the highest dosage. All doses reduced the facilitation of avoidance response rates normally noted during the aversive CS and severely reduced general motor activity. Results are interpreted to suggest that THC may reduce the level of fear normally generated during the presentation of an aversive CS previously associated with unavoidable shock. (18 ref) —*Journal abstract*

2080. Hughes, R. N. & Greig, Andrea M. (U Canterbury, Christchurch, New Zealand) **Spontaneous alternation in ferrets following treatment with scopolamine, chlordiazepoxide, and caffeine.** *Physiological Psychology*, 1975(Jun), Vol 3(2), 155-156.—Studied the frequencies of spontaneous alternation in 29 ferrets following injections of saline or 2 doses of scopolamine, chlordiazepoxide or caffeine. All 3 drugs significantly reduced alternation while having no effect on choice latencies. Results are discussed in the light of their comparative relevance to theories based on central cholinergic activity. (19 ref)—*Journal abstract*.

2081. Inoue, Naohide; Tsukada, Yasuo & Barbeau, André (U Montreal, Canada) **Behavioral effects in rats following intrastriatal microinjection of manganese.** *Brain Research*, 1975, Vol 95(1), 103-124.—In a series of studies with a total of 89 male Sprague-Dawley rats, injection of manganese (25, 50, and 100 µg) into 1 caudate nucleus resulted in a predominant ipsilateral turning behavior, accompanied at higher doses by an intermittent, alternating, and dose-related incidence of contralateral turning and stereotypies. Although the effects of alpha-methylparatyrosine, levodopa, and pargyline indicated a definite participation of the dopaminergic system in the latter 2 phenomena, it is probable that ipsilateral turning is the result of involvement of other transmitter systems as well. Tegmental serotonergic and intrastriatal cholinergic pathways appear to be involved in the production of the basic postural asymmetry resulting in turning. The amount of interference with the nigrostriatal and mesolimbic dopaminergic pathways may determine the speed of circling and the concurrent inhibition of locomotion. Results support the existence of dual ipsilateral and contralateral syndrome-inducing systems in the caudate postulated by A. R. Cools and the complementary roles of dopamine, serotonin, and acetylcholine within that nucleus. (91 ref)—*Journal abstract*.

2082. Karpiak, Stephen E. & Rapport, Maurice M. (New York State Psychiatric Inst. Div of Neuroscience, New York) **Behavioral changes in 2-month-old rats following prenatal exposure to antibodies against synaptic membranes.** *Brain Research*, 1975, Vol 92(3), 405-413.—In 3 experiments, 72 2-mo-old male offspring of Sprague-Dawley rats injected iv on Day 19 of gestation with antiserum to synaptic membrane fraction showed marked behavioral deficits on a DRL training paradigm. These behavioral deficits included perseveration, slow acquisition rates, and poor retention. Offspring of pregnant rats injected with antiserum to galactocerebroside or isotonic saline did not show these behavioral effects. Results extend those of previous studies that antibodies against the synaptic membrane fraction are able to alter behavior. (22 ref)—*Journal abstract*.

2083. Kim, Jin-Soo & Hassler, Rolf. (Max-Planck-Institut für Hirnforschung, Neurobiologische Abteilung, Frankfurt, W Germany) **Effects of acute haloperidol on the gamma-aminobutyric acid system in rat striatum and substantia nigra.** *Brain Research*, 1975, Vol 88(1), 150-153.—Administered a single 10 mg/kg ip injection of haloperidol to adult male Sprague-Dawley rats. The haloperidol dose significantly decreased GABA levels

but not levo-glutamate decarboxylase or levo-glutamate-gamma-aminobutyrate transaminase levels in the striatum and substantia nigra. These decreases may result in the decreased inhibition of dopaminergic nigro-striatal neurons and thereby activate the turnover dopamine and increase homovanillic acid in the striatum. (24 ref)

2084. Kjellberg, B. & Randrup, A. (AB Fenosa, Malmö, Sweden) **Behavioural effects of thymoleptics in vervet monkeys (*Cercopithecus aethiops*).** *Psychopharmacologia*, 1975, Vol 43(3), 267-269.—An experiment with 4 vervet monkeys showed that desmethylinipramine (DMI) exerts diverse quantitative effects on the gross behavior of monkeys. Excitatory as well as sedative effects were observed, which varied according to the general animal temperament. Effects resembling those obtained with DMI (5 mg/kg) were observed using chlorimipramine (5 mg/kg) and iprindole (20 mg/kg), although the effects of iprindole were less marked. Chlorimipramine also produced immobilization and postural change. Results are discussed in relation to behavioral effects of thymoleptics in humans, and the use of monkeys in preclinical testing of thymoleptic drugs is suggested.—*Journal abstract*.

2085. Krauz, V. A. (USSR Academy of Medical Sciences, Inst of Experimental Medicine, Leningrad) **[Neurophysiological mechanisms accounting for the action of stimulants.]** (Russ) *Farmakologiya i Toksikologiya*, 1975(Mar-Apr), Vol 38(2), 138-141.—Carried out experiments on 9 dogs, with chronically implanted electrodes, in a delayed choice situation involving food rewards. The intramuscular introduction of strychnine (0.03 mg/kg) and ethimizol (1-3 mg/kg) was found to improve short-term memory and was accompanied by changes in the level of excitement in some brain structures. The effects of the 2 substances in this respect were similar, but not identical. Caffeine (3-15 mg/kg) also showed different effects on various brain structures, but had no effect on short-term memory. (English summary) (17 ref)—A. G. Pook.

2086. Lal, Harbans. (U Rhode Island, Coll of Pharmacy) **Narcotic dependence, narcotic action and dopamine receptors.** *Life Sciences*, 1975(Aug), Vol 17(4), 483-496.—Reviews selected experimental data, showing that acute systemic administration of narcotic analgesics increases the firing rate of nerve cells in the zona compacta of the substantia nigra, causes an increase in the rate of dopamine (DA) turnover in striatal and mesolimbic areas of the brain, stimulates prolactin release, inhibits brain self-stimulation and discriminated shock-avoidance, blocks cardiovascular effects of systemically injected DA, blocks aggression as well as compulsive jumping in mice treated with DOPA and amphetamine, antagonizes stereotypy induced by apomorphine or amphetamine, and blocks apomorphine-induced vomiting in dogs. Chronic administration of narcotic analgesics results in withdrawal signs upon the cessation of the drug administration. It is concluded that acute administration of narcotic drugs results in an inhibition of DA-receptor activity, while chronic administration of these drugs results in an increased response of these DA receptors to DA agonists. Recent experiments on the interaction of other drugs with narcotic analgesics suggest that, unlike the direct action of

neuroleptics on the DA receptors, the narcotic action on DA receptors is indirect. (104 ref)—*Journal abstract*

2087. LaManna, Joseph C. & Rosenthal, Myron. (Duke U, Medical School) **Effect of ouabain and phenobarbital on oxidative metabolic activity associated with spreading cortical depression in cats.** *Brain Research*, 1975, Vol 88(1), 145-149.—Examined the effects of small intracortical injections of ouabain (up to 14 μ l) systematically administered phenobarbital (20 and 80 mg/kg iv) on fluorescence changes due to the production of spreading depression. Results show that ouabain changes the rate of the larger decrease in fluorescence caused by spreading cortical depression (SD) and has no effect on the rate of recovery of fluorescence.

2088. Le Moal, Michel; Gale, Daniel & Cardo, Bernard. (U Bordeaux, Inst de Biologie Animale, Lab de Psychophysiologie, Talence, France) **Behavioral effects of local injection of 6-hydroxydopamine in the medial ventral tegmentum in the rat: Possible role of the mesolimbic dopaminergic system.** *Brain Research*, 1975, Vol 88(1), 190-194.—Administered bilateral injections of 2 μ g of 6-hydroxydopamine (6-OH-DA) to male Sprague-Dawley rats. Nocturnal locomotor activity was measured 7 and 21 days after the ventral mesencephalic tegmentum (VMT) injections in 12 6-OH-DA-treated Ss (experimental) and 10 controls. Passive avoidance behavior was measured 30-45 days after injections in 10 experimental and 8 control Ss. Results show that selective destruction of the aminergic neurons in the VMT leads to locomotor hyperactivity and a passive avoidance deficit. Findings demonstrate that destruction of the catecholamine neurons in the medial VMT is also sufficient to elicit this syndrome. Results may provide an animal model for the study of certain pathophysiological conditions. (20 ref)—*L. Gorsey*.

2089. Levante, A.; Lamour, Y.; Guilbaud, G. & Besson, J. M. (U Pierre et Marie Curie, Lab de Physiologie Ctr Nerveux, Paris, France) **Spinothalamic cell activity in the monkey during intense nociceptive stimulation: Intra-arterial injection of bradykinin into the limbs.** *Brain Research*, 1975, Vol 88(3), 560-564.

2090. Lush, I. E. (Royal Free Hosp, Medical School, London, England) **A relationship between hexobarbitone sleeping time and susceptibility to mescaline in mice from different strains.** *Psychopharmacologia*, 1975, Vol 43(3), 259-260.—Male mice from the following strains were surveyed with respect to their hexobarbitone (90 mg) sleeping time: A2G, C57BR, C3H, F/st, CBA, ICFW, and Schneider. Males from the same strains had previously been surveyed by the author (1975) with respect to the inhibitory effect of mescaline on their emotional defecation. There was a strong interstrain correlation between the 2 measures. This correlation was unexpected on theoretical grounds and may have important pharmacogenetic implications.—*Journal abstract*.

2091. Majchrowicz, Edward. (NIAA&A, Lab of Alcohol Research, St Elizabeths Hosp, Washington, DC) **Induction of physical dependence upon ethanol and the associated behavioral changes in rats.** *Psychopharmacologia*, 1975, Vol 43(3), 245-254.—Describes a technique for the induction of physical dependence on ethanol in

the rat. Using male Sprague-Dawley rats, the dependence was induced by intragastric intubation of 20% (w/v) ethanol solutions at 9-15 g/kg in 3-5 fractional doses daily for 4 days. 2 phases were distinguished during the withdrawal period: (a) Prodromal detoxication, characterized by a spectrum of signs and responses of diminishing severity, related to the decline in blood ethanol concentrations (e.g., death, coma, and ataxia). (b) Ethanol dependence, characterized by a spectrum of withdrawal signs and reactions of progressively increasing severity as blood ethanol concentration approached 100 mg/dl (e.g., hyperactivity, tremors, akinesia, and spastic rigidity). A rapid succession of 2 diverse clusters of signs and reactions represents a reversal of the CNS function from the extremes of ethanol intoxication (CNS depression) to the extremes of ethanol dependence (CNS hyperexcitability) during the withdrawal period. (37 ref)—*Journal abstract*.

2092. Malakhovskii, V. G. & Prozorovskii, V. B. (Kirov Military Medical Academy, Leningrad, USSR) **[Behavioral disorders in the progeny of rats subjected to the chronic action of alcohol.]** (Russ) *Farmakologiya i Toksikologiya*, 1975(Jan-Feb), Vol 38(1), 88-90.—Gave a 15% ethyl alcohol solution as the only source of fluid to both male and female rats for a period of 3 mo. After this, Ss were mated with intact animals. The behavioral reactions of the offspring were tested, at 1 mo of age, for aggressiveness, avoidance CRs and the reaction of choice by avoidance. All these behaviors were found to be severely disrupted. (English summary)—*A. G. Pook*.

2093. Markin, V. A. & Mitrofanov, V. S. (USSR Academy of Medical Sciences, Inst of Pharmacology, Moscow) **[Histochemical analysis of the influence exerted by some psychotropic substances on the dehydrogenase activity of various brain structures.]** (Russ) *Farmakologiya i Toksikologiya*, 1975(Jan-Feb), Vol 38(1), 10-12.—Studied the effects of chlorpromazine (1-20 mg/kg), triftazine (2-50 mg/kg), phthoracizine (1-50 mg/kg) and lithium carbonate (20-100 mg/kg) on various brain structures in 250 rats. Ss' brains were studied at 1, 3, and 24 hrs after a single introduction, and after daily administration for 7-30 days. The selective effects of these substances on dehydrogenase activity in the brain are discussed. Long-term administration of the substances was found to lead to a certain amount of adaptation to their pharmacological action in some cerebral structures. (English summary)—*A. G. Pook*.

2094. Mashkovskii, M. D. & Andreeva, N. I. (Ordzhonikidze National Chemical-Pharmaceutical Scientific Research Inst, Moscow, USSR) **[An experimental study into the psychotropic action of pyrazidol.]** (Russ) *Farmakologiya i Toksikologiya*, 1975(Jan-Feb), Vol 38(1), 5-10.—Studied the neurotropic and psychotropic activity of pyrazidol in a series of experiments on rats, mice, cats, and dogs. The interactions of the drug with amphetamine, adrenaline, and noradrenaline were examined. Pyrazidol was found to possess pharmacological properties characteristic of a substance with an antidepressant effect, and is especially similar to tricyclic antidepressants. It is, however, distinctive in having no cholinolytic effect, but shows a cataleptic effect and has a lower toxicity. (English summary) (17 ref)—*A. G. Pook*.

2095. McMillan, D. E. & Harris, Louis S. (U North Carolina, Medical School, Chapel Hill) **Behavioral and morphine-antagonist effects of the optical isomers of pentazocine and cyclazocine.** *Journal of Pharmacology & Experimental Therapeutics*, 1972, Vol 180(3), 269-279.

—Determined the effects of dextro-, levo-, and racemic cyclazocine and dextro-, levo-, and racemic pentazocine on the effects of d-, l- and dl-cyclazocine and d-, l- and dl-pentazocine were determined on the rate of conditioned keypecking in the pigeon under a multiple FR-FI schedule of food presentation. At low doses both isomers of cyclazocine and pentazocine increased the rate of keypecking under the FI schedule. At higher doses both isomers of cyclazocine and pentazocine decreased the rate of responding under both schedule components. The levo-isomers were more potent in decreasing the rate of responding. Both dextro- and levocyclazocine blocked the rate-decreasing effects of morphine on schedule-controlled behavior, but levocyclazocine was more than 30 times as potent as dextrocyclazocine. Neither dextro- nor levopentazocine blocked the rate-decreasing effects of morphine.—*Journal abstract*.

2096. Moyano, R. Soto et al. (U Chile, Santiago) **Effect of pentazocine on the evoked potentials recorded in the primary somesthetic cortical areas of guinea pigs.** *Brain Research*, 1975, Vol 88(3), 475-481.—Studied the influence of pentazocine on the evoked potentials registered in the primary somesthetic cortical area in adult guinea pigs under pentobarbital anesthesia. The stimulation was applied in the contralateral lip, and the evoked cortical responses from different zones on the cortex stereotaxically localized were registered. Pentazocine (5-10 mg/kg iv) induced a significant increase in the latency of the evoked potentials as compared with controls. Since morphine does not modify these potentials, the effect of pentazocine is interpreted as being a direct one on the primary pain pathway.—*Journal abstract*.

2097. Myers, R. D. (Purdue U, Lab of Neuropsychology) **Impairment of thermoregulation, food and water intakes in the rat after hypothalamic injections of 5,6-dihydroxytryptamine.** *Brain Research*, 1975, Vol 94(3), 491-506.—A bilateral microinjection into the anterior hypothalamus of 5,6-dihydroxytryptamine caused a rise in the body temperature, suppressed food and water intakes, and a decline in body weights in male Sprague-Dawley rats. Results support the view that a serotonergic mechanism in the hypothalamus is involved in both thermoregulation and the control of ingestive behavior. (44 ref)

2098. Oksenkrug, G. F. (Bekhtereva Scientific Research Inst of Psycho-neurology, Leningrad, USSR) **[Resemblance of the influence produced by secondary and tertiary tricyclic antidepressants on the effect of reserpine in frogs and on the serotonin absorption by human thrombocytes.]** (Russ) *Farmakologiya i Toksikologiya*, 1975(Jan Feb), Vol 38(1), 23-25. Both secondary and tertiary tricyclic antidepressants were found to strengthen the effects of reserpine on frogs and delay the absorption of serotonin by human thrombocytes. Some had a stronger effect than others. (English summary)—A. G. Pook.

2099. Payne, Ronald J. & Brand, Stanley N. (US Army Medical Dept Activity, Gastroenterology Service, Ft Carson, CO) **The toxicity of intravenously used marihuana.** *JAMA: Journal of the American Medical Association*, 1975(Jul), Vol 233(4), 351-354.—Reports 4 case examples in which iv usage of marihuana was hazardous. The severity of the multisystemic involvement was dose-related. On initial examination, signs of most severe overdosage included fulminant gastroenteritis, hypoalbuminemia, toxic hepatitis confirmed by serial biopsy, acute renal failure, electrolyte disturbances, leukocytosis, anemia, and relative thrombocytopenia.

2100. Poirier-Litré, M.-F. et al. (Hôpital Ste Anne, Service hospitalo-universitaire de Santé mentale et de Thérapeutique, Paris, France) **[Attempt to classify and help prescribe psychotropic drugs by computer.]** (*Encephale*, 1975(Feb), NS Vol 1(2), 113-120.—Presents a hierarchy of 34 psychotropic drugs, particularly as to their disinhibiting or sedative action. Tree graphs are presented to show indications and contraindications.

2101. Popova, N. K. & Bertogaeva, V. D. (USSR Academy of Sciences, Inst of Cytology & Genetics, Siberian Branch, Novosibirsk) **[Participation of serotonin-reactive brain structures in some forms of the behavioral pattern of hamsters.]** (Russ) *Farmakologiya i Toksikologiya*, 1975(Mar-Apr), Vol 38(2), 148-151.—Studied play behavior in small groups of 18-40 day old golden hamsters. 5-hydroxytryptamine (5-HT or serotonin) (10 and 100 mg/kg), iprazid (50 mg/kg) and dihydroxyphenylalanine (DOPA; 50 mg/kg) were introduced ip 30 min before experiments. Serotonin levels in the brain were obtained from Ss sacrificed while playing and while sleeping before and after playing. Intense play in the Ss was accompanied by a decrease in the level of serotonin in the brainstem, while sleep was accompanied by an increase. Only iprazid and 5-HT had an effect on play, inhibiting it. A lowering of the serotonin level in the brainstem was also found to accompany aggressive behavior between mature males. It is concluded that changes in the serotonin level reflect the level of activity, rather than particular emotional states. (English summary)—A. G. Pook.

2102. Rezek, Milan & Novin, Donald. (U Manitoba, Winnipeg, Canada) **The effects of serotonin on feeding in the rabbit.** *Psychopharmacologia*, 1975, Vol 43(3), 255-258.—Serotonin infused through hepatic-portal cannulae in 11 rabbits decreased food intake in a free-feeding condition, but following a 12-hr food deprivation period, similar doses of serotonin increased food intake. Results demonstrate that serotonin is not a simple "satiety hormone" but suggest that it may be importantly involved in short-term regulatory mechanisms of feeding. (17 ref)

2103. Risberg, Ann-Marie; Risberg, Jarl & Ingvar, David H. (U Lund Hosp, Lab of Clinical Neurophysiology, Sweden) **Effects of promethazine on nocturnal sleep in normal man.** *Psychopharmacologia*, 1975, Vol 43(3), 279-284.—Studied the effects of promethazine on sleep in 10 healthy volunteers in 2 double blind polygraphic studies. Study 1 consisted of a single dose study with 10, 100, and 200 mg promethazine, using 100 mg pentobarbital as a reference substance. In Study 2, 4 Ss spent 20 consecutive nights with 9 drug nights (promethazine 100

mg), followed by a placebo withdrawal period of 6 nights in the sleep laboratory. Promethazine showed a dose related REM-depressing effect with a greater decrease, the higher the dose. An increase of REM-latency together with a decrease of REM-periods was also seen, and while pentobarbital gave a decrease in REM-density, promethazine did not cause any changes in the phasic REM-component. A REM-rebound was seen in the 1st night of withdrawal. Promethazine in the highest dose, 200 mg, gave drowsiness and hangover effects in 14 of 20 nights. The REM-depressing effect of promethazine together with its relatively weak REM-rebound effect may explain its value in the treatment of withdrawal symptoms following abuse of alcohol and barbiturates. (22 ref)—*Journal abstract*.

2104. Rosenfeld, J. Peter & Kowatch, Robert. (Northwestern U, Cresap Lab of Neuroscience & Behavior) **Differential effect of morphine on central versus peripheral nociception.** *Brain Research*, 1975, Vol 88(1), 181-185.—Administered aversive stimulation to 3 areas of the brains of 10 male albino rats (nucleus subcoeruleus of the pontine reticular formation, the intercollicular nucleus of the midbrain, and the dorsal-lateral central gray substance of the midbrain). Noxiousness of the stimulation was measured by performance in a 2-way avoidance box. After 30 min of habituation to a peripheral test box, 2 ascending series of footshock trains were delivered at a rate of 1 train/5 sec in 30 μ A steps beginning at 50 μ A. Following determinations of baseline central and peripheral nociceptive thresholds, Ss were injected with morphine sulfate solution (6 mg/kg, subcutaneously). 45 min later, thresholds were again determined in the 2-way avoidance box. Results indicate that morphine, given in doses producing clear analgesia to peripheral pain, does not alter the nociceptive reaction threshold to aversive brain stimulation. It is suggested that opiate analgesia involves inhibition of nociception below the level of the brain stem and that opiate drugs activate a central structure that inhibits transmission of nociceptive information through the spinal cord. 2105. Roth, Walton T. et al. (Stanford U, Medical School, Lab of Clinical Psychopharmacology & Psychophysiology) **Marihuana effects on TAT form and content.** *Psychopharmacologia*, 1975, Vol 43(3), 261-266.—In a double-blind study, 72 normal male 18-25 yr olds were given either placebo or marihuana containing 20 mg Δ^9 -tetrahydrocannabinol. Stories written to cards selected from the TAT did not differ on hostile or sexual content scales between drug and placebo conditions, but 6 out of 10 scales specifically constructed to detect marihuana effects were successful at differentiating the 2 conditions. Under marihuana the stories had a timeless, nonnarrative quality, with greater discontinuity in thought sequence and more frequent inclusion of contradictory ideas. Novelty of content was somewhat increased by marihuana, while relation to the picture, imagery, repetition, and closure were not significantly affected. (21 ref)—*Journal abstract*.

2106. Schoenfeld, Ronald I. & Uretsky, N. J. (Squibb Inst for Medical Research, Behavioral Pharmacology Lab, Princeton, NJ) **Enhancement by 6-hydroxydopamine of the effects of dopa upon the motor activity of**

rats. *Journal of Pharmacology & Experimental Therapeutics*, 1973, Vol 186(3), 616-624.—Determined the effect of dopa on the motor activity of rats 2 wks after the iv administration of 6-hydroxydopamine (6-HDA) or vehicle. After inhibition of peripheral decarboxylase activity, dopa had a dose-related biphasic effect on the motor activity of vehicle-treated Ss. It decreased motor activity at low doses and increased motor activity at high doses. 6-HDA-treated Ss showed a biphasic dose-response curve, although the effects of dopa occurred at lower doses. The maximal increase in motor activity of 6-HDA-treated Ss occurred within 1 hr of dopa administration and coincided with the maximal accumulation of both dopa and dopamine (DA) in whole brain. Inhibition of decarboxylase activity in the CNS prevented the accumulation of DA without altering brain level of dopa. Although this suggests that DA formed from dopa mediated the effect of dopa in 6-HDA-treated Ss, DA accumulation was never higher in these Ss than in vehicle-treated Ss, nor was there a higher level of DA in any brain region examined. It was found, however, that dopa increased motor activity as soon as 24 hrs after the 2nd dose of 6-HDA. Results suggest that the enhanced effect of dopa in 6-HDA-treated rats is due to the production of a supersensitivity to catecholamines in the CNS of these animals.—*Journal abstract*.

2107. Shumilova, N. E. (Medical Inst, Kemerovo, USSR) [Influence of stimulation of the thalamic associative nuclei on the behavior of cats.] (Russ) *Zhurnal Vyssheĭ Nervnoĭ Deyatel'nosti*, 1974(Jan-Feb), Vol 24(1), 186-188.—Studied the effect of chemical and electrical stimulation in the thalamic region on the conditioned reflex behavior in 12 cats. After conditioning occurred, 6 Ss received cannulation in the medial dorsal, contralateral, and pulvinar nuclei of the thalamus. Adrenaline, noradrenaline, and KCl dosages were administered to some Ss and electrical stimulation to thalamic regions in other Ss. Results of the chemical effects vs the electrical stimulation affecting the S's thalamus were compared in terms of the consequences it had on behavior. Implications are drawn regarding the establishment of neuronal functional connections in the cat's associative area of the brain.—*L. V. Majovski*.

2108. Singer, G.; Armstrong, S.; Evans, B. & Burnstock, G. (La Trobe U, Bundoora, Australia) **Comparison of the effects of intracranial injections of 6-OHDA and guanethidine on consummatory behavior and monoamine depletion.** *Pharmacology, Biochemistry & Behavior*, 1975, Vol 3(Suppl 1), 91-106.—Reviews experiments in which the effects of injection of 6-hydroxydopamine (6-OHDA) and guanethidine into the rat brain on consummatory behavior and temperature regulation are compared and related to changes in monoamine levels as shown by fluorescence histochemistry. Injections of 6-OHDA into anterior hypothalamic areas had lethal effects on food deprived Ss. This effect may be explained in terms of loss of ability to regulate temperature. Ss whose catecholamines were depleted by guanethidine injections into anterior lateral hypothalamus showed a consistent reduction in food and water intake and an elevation of body temperature. A comparative study of the intracranial diffusion patterns of guanethidine and 6-OHDA revealed marked differ-

ences in the extent of diffusion as seen with the fluorescence histochemical method when injected acutely or chronically into the lateral hypothalamus, the substantia nigra, or the amygdala of the rat brain. At the doses used, guanethidine, but not 6-OHDA, caused specific damage to catecholamine-containing neurons up to a distance of at least 3 mm from the cannula tip. These differences between the effects of the 2 drugs are explained in terms of their unique pharmacological properties and their estimated decay in CNS tissue. An attempt is made to account for the differences in behavioral data and in particular the variability of the 6-OHDA data in terms of the differences in the type of damage produced by the 2 drugs and the extent of their diffusion. (52 ref)—*Journal abstract*.

2109. **Sjöden, Per-Olov & Söderberg, Ulf.** (Uppsala, Ulleraker Hosp, Sweden) **Long-lasting effects of prenatal 2,4,5-trichlorophenoxyacetic acid on open-field behavior in rats: Pre- and postnatal mediation.** *Physiological Psychology*, 1975(Jun), Vol 3(2), 175-178. —A single dose of 2,4,5-trichlorophenoxyacetic acid (2,4,5-T) was given to 12 female albino rats in the 1st wk of pregnancy. Controls received oil vehicle. At birth, half of the acid-treated and half of the oil-treated litters were cross-fostered. Open-field behavior was studied in separate groups of offspring at 35, 60, 95, and 125 days of age. Results at 35 and 60 days showed a prenatal as well as a postnatal augmenting effect on ambulation and rearing, particularly on the 1st day of testing. No effects were obtained at 95 days. At 125 days, a postnatal depressing effect of prenatal 2,4,5-T was suggested for rearing behavior. A possible relationship between the rate of exploratory reactions and the thyroid activity in these Ss is discussed.—*Journal abstract*.

2110. **Smith, Gerard P.; Levin, Barry E. & Ervin, Gregory N.** (New York Hosp, E. W. Bourne Lab, White Plains) **Loss of active avoidance responding after lateral hypothalamic injections of 6-hydroxydopamine.** *Brain Research*, 1975, Vol 88(3), 483-498. —After injections of 6-hydroxydopamine (6-OHDA) along the medial fore-brain bundle in the lateral hypothalamus, male Sprague-Dawley rats ($N = 179$) failed to acquire a 1-way active avoidance response or failed to perform a previously acquired active avoidance response. Such Ss, however, acquired a passive avoidance response and a conditioned taste aversion normally. Failure to acquire or perform the active avoidance responses was correlated with the loss of hypothalamic, striatal, and forebrain catecholamines produced by lateral hypothalamic 6-OHDA injections. Identical injections of 6-OHDA placed along the medial hypothalamus produced a similar loss of regional catecholamines, but medial 6-OHDA injections did not affect active avoidance responding. This dissociation between loss of catecholamines and the capacity for active avoidance responding is interpreted to mean that medial 6-OHDA injections did not damage the same catecholaminergic terminal fields as lateral 6-OHDA injections and that the integrity of the terminal fields damaged by lateral 6-OHDA injections is necessary for active avoidance responding. (49 ref)—*Journal abstract*.

2111. **Smith, Jamie K.; Smith, Landgrave T.; Orr, William C. & Humphrey, G. B.** (U Oklahoma, Health Sciences Ctr) **Circadian toxicity cycles for Cytosan in**

mice: Effects of population density. *Biological Psychology Bulletin*, 1975(Feb), Vol 4(1), 23-27. —A single lethal dose of cyclophosphamide (Cytosan) was administered at 4-hr intervals during a 24-hr period to independent groups of mice housed at caging densities of 5, 6, or 10 to the cage. A circadian toxicity cycle was found for Ss housed 5 or 6 to the cage, with highest mortality in the group injected during the transition period from dark to light ($p < .01$). Some evidence of an ultradian susceptibility cycle to Cytosan was also found. Periods of peak mortality for Ss housed 10 to the cage were phase shifted in comparison to the groups housed 5 or 6 to the cage, and the amplitude of the peaks was reduced. No significant toxicity was found in this group, suggesting that population density may influence biological rhythmicity.—*Journal abstract*.

2112. **Solomatina, E. S. & Klygul', T. A.** (USSR Academy of Medical Sciences, Inst of Normal & Pathological Physiology, Moscow) **[The effect of diazepam on the behavior of rats adapted to high-altitude hypoxia in a conflict situation.]** (Russ) *Farmakologiya i Toksikologiya*, 1975(Jan-Feb), Vol 38(1), 20-23. —Produced a conflict situation in rats by giving an electric shock each time they were about to drink. The influence of diazepam (15 mg/kg) on the behavior of the Ss in this situation was studied in naive Ss and in Ss adapted to the conditions of high-altitude hypoxia. Individually, both diazepam and adaptation to hypoxia were found to reduce conflict behavior in the initial conflict situation. In repeated conflict situations diazepam lessened conflict behavior, but hypoxia adaptation strengthened it. The effect of diazepam, in both initial and repeated conflict situations, was increased when introduced to Ss already adapted to hypoxia. (English summary)—*A. G. Pook*.

2113. **Spano, P. F. et al.** (U Milan, Inst of Pharmacology & Pharmacognosy, Italy) **LSD and dopamine-sensitive adenylate-cyclase in various rat brain areas.** *Brain Research*, 1975, Vol 93(1), 164-167. —Investigated whether dextro-LSD directly and selectively stimulates dopamine-(DA)-sensitive adenylate-cyclase in striatum and in other areas of the limbic system which appear to be more strictly linked to perception, feeling and emotional behavior. Data from male Charles River rats give strong support to the hypothesis of a direct effect of dextro-LSD on the DA-sensitive adenylate-cyclases which have been associated with the dopaminergic receptors in brain. (20 ref)

2114. **Suvorov, V. V.** (USSR Academy of Sciences Pavlov Inst of Physiology, Leningrad) **[Effect of chemical stimulation of the dorsal and ventral segments of the caudate nucleus head on alimentary conditioned reflexes in dogs.]** (Russ) *Zhurnal Vysshego Nervnogo Deiatel'nosti*, 1974(Jan-Feb), Vol 24(1), 34-39. —Describes results of chemical stimulation effects on positive and inhibitory salivary conditioned reflexes with food reinforcement in dogs pre and postoperatively. Considerable differences in caudate nucleus segments in the changes of the secretory component of the conditioned reaction was demonstrated (English summary) (15 ref)

2115. **Larsen, Daniel; Pynock, Christopher; Meldrum, Brian & Marsden, C. David.** (Bristol, VA Hosp, NIA) **Rotational behavior induced in rats by intranigral**

picrotoxin. *Brain Research*, 1975, Vol 89(1), 160-165.—Determined whether rotational behavior can be produced in male Sprague-Dawley rats by injection of picrotoxin, a postsynaptic gamma-aminobutyric acid (GABA) antagonist, 1 substantia nigra. Results provide behavioral evidence for a GABA-mediated inhibition of dopaminergic nigrostriatal system. (32 ref)

2116. Tecce, Joseph J.; Cole, Jonathan O. & Savignano-Bowman, June. (Boston State Hosp, Lab of Neuropsychology, MA) **Chlorpromazine effects on the brain activity (contingent negative variation) and reaction time in normal women.** *Psychopharmacologia*, 1975, Vol 43(3), 293-295.—Studied contingent negative variations (CNV) and reaction time (RT) in 28 normal women (mean age, 22.07 yrs) after they received oral administrations of 50 mg chlorpromazine (CPZ) or placebo. CPZ reduced CNV 2 and 3 hrs postdrug and slowed RT 3 hrs postdrug. CNV amplitude appears to be an accurate indicator of drug-produced changes in alertness.—*Journal abstract*.

2117. Tessel, Richard E. & Woods, James H. (U Colorado, Medical School, Denver) **Fenfluramine and N-ethyl amphetamine: Comparison of the reinforcing and rate-decreasing actions in the rhesus monkey.** *Psychopharmacologia*, 1975, Vol 43(3), 239-244.—Evaluated N-ethyl amphetamine HCl (NEA) and fenfluramine HCl (meta-trifluoromethyl N-ethyl amphetamine) as reinforcers in 3 rhesus monkeys that had been previously trained to press a lever using food presentations and cocaine HCl injections as reinforcers. Each daily session consisted of episodic opportunities to obtain reinforcers under a FR-30 schedule. A drug period was interpolated between 2 periods in which leverpress responding was maintained by food presentations. None of the drugs altered the rate of responding in the food periods which preceded the drug sessions. However, NEA and fenfluramine self-injection resulted in dose-related decreases in response rates during the food periods which immediately followed the drug sessions. Cocaine HCl (30 μ g/kg/injection) maintained high response rates at over 1 response/sec during the drug periods, as did the same dose of NEA. Doses of 10 and 100 μ g/kg/injection of NEA as well as all doses of fenfluramine HCl (10-300) μ g/kg/injection maintained rates that were not different from those associated with saline injections. Results substantiate and extend earlier findings with fenfluramine and indicate that its failure to act as a reinforcer is attributable to its meta-trifluoromethyl group. (19 ref) —*Journal abstract*.

2118. Tilson, H. A. & Sparber, S. B. (Michigan State U) **The effects of *d*- and *l*-amphetamine on fixed-interval and fixed-ratio behavior in tolerant and nontolerant rats.** *Journal of Pharmacology & Experimental Therapeutics*, 1973, Vol 187(2), 372-379.—Male albino rats were trained to leverpress for food on an FI 75-sec or an FR-30 schedule of reinforcement. The dose-related effects of dextro- or levoamphetamine on responding during successive 15-sec segments of the FI interval, as well as the overall response rate, were investigated. Dextroamphetamine (0.16 mg/kg ip) increased responding significantly in the 1st 15 and last 30 sec of the 75-sec interval, while 0.50 mg/kg affected responding significantly throughout. Both doses increased overall FI

responding significantly. FI responding was not affected by lower doses of levoamphetamine (0.15 and 0.30 mg/kg), whereas intermediate doses (0.50 and 1.0 mg/kg) increased responding in the last 15-45 sec. Overall response rates were increased. Responding in the 1st 15 sec was not affected by most doses of levoamphetamine, but 1.5 mg/kg decreased responding in this segment. 2.0 mg/kg decreased responding in the 1st 15 and last 30 sec. Overall responding was decreased by this dose. A complete cross-tolerance was not observed between dextro- and levoamphetamine at doses which were equieffective in altering performance. The lack of a complete cross-tolerance suggests that dextro- and levoamphetamine are producing unequal peripheral and/or central effects at the doses employed and may be affecting schedule-controlled behavior by different mechanisms.—*Journal abstract*.

2119. Tilson, H. A. & Sparber, S. B. (U Minnesota) **Studies on the concurrent behavioral and neurochemical effects of psychoactive drugs using the push-pull cannula.** *Journal of Pharmacology & Experimental Therapeutics*, 1972, Vol 181(3), 387.—Infused 3 H-norepinephrine (3 H-NE) or 14 C-serotonin (14 C-5-HT) iv 1 hr or 30 min before rats had their lateral ventricles perfused with artificial cerebrospinal fluid through push-pull cannulas while responding for food on an FR-30 schedule. 12-15 min into the schedule, Ss were injected ip with dextroamphetamine, mescaline, LSD, or saline. Only amphetamine produced a dose-dependent increase of tritium in the perfusate, in addition to shortening latencies to behavioral disruption. Analysis of the perfusate taken during the 5 mg/kg amphetamine session revealed increased concentrations of radioactivity in segments having values of authentic NE and normetanephrine. Mescaline produced similar effects on behavior. Separation of the perfusate after 20 mg/kg mescaline revealed apparent increased proportions of 14 C-hydroxy-indoleacetic acid. LSD disrupted responding in a manner similar to the high doses of mescaline and amphetamine but produced a significant decrease in 14 C released, without altering the metabolic disposition of 5-HT. Data suggest that mescaline and amphetamine act presynaptically to produce the release and/or block the reuptake of 5-HT and NE. LSD produces an apparent inhibition of release of 5-HT, perhaps via a presynaptic action or through postsynaptic feedback inhibition.—*Journal abstract*.

2120. Tilson, H. A. & Sparber, S. B. (U Minnesota) **Similarities and differences between mescaline, lysergic acid diethylamide-25 (LSD) and *d*-amphetamine on various components of fixed interval responding in the rat.** *Journal of Pharmacology & Experimental Therapeutics*, 1973, Vol 184(2), 376-384.—Trained 3 male albino rats to leverpress for food on an FI 75-sec schedule. Responding in the 1st and last 15 sec, as well as overall response rates, were analyzed. The effects of LSD, amphetamine, and mescaline hydrochloride on FI responding were investigated. LSD (0.015 mg/kg) increased responding in all portions of the interval, whereas higher doses tended to decrease responding. Amphetamine (0.15 and 0.48 mg/kg) increased rates of responding except at the highest dose (0.96 mg/kg) which decreased responding in the last 15 sec of the

interval. Mescaline (3-12 mg/kg) produced dose-related increases in responding in the initial 15 sec while decreasing responding in the last 15 sec of the interval. In Ss tolerant of the mescaline (3 mg/kg), there were indications of cross-tolerance of the effects of 0.15 mg/kg of amphetamine, but no cross-tolerance was observed when the order of drug presentation was reversed. A 2-way, partial cross-tolerance was observed between the effects of 0.045 mg of LSD and 3 mg of mescaline, and Ss tolerant to the effects of 0.015 mg of LSD did not show cross-tolerance to the effects of 0.15 mg of amphetamine, regardless of the order of drug presentation. Data suggest mescaline shares common mechanisms or components of behavioral action with both LSD and amphetamine in the rat.—*Journal abstract.*

2121. Tolpyshev, B. A. [The effect of psychotropic agents on the electroencephalographic characteristics of the inhibitory function of the caudal nucleus.] (Russ) *Farmakologiya i Toksikologiya*, 1975(Jan-Feb), Vol 38(1), 15-17.—A series of 38 experiments on 5 non-narcotized cats show that amphetamine (2 mg/kg) and benactyzine (0.2-0.4 mg/kg) weaken the cortical effects of low frequency stimulation of the caudate nucleus. Chlorpromazine (1 mg/kg) and haloperidol (0.5 mg/kg) increased these effects, but the introduction of caffeine (15-30 mg/kg) had no effect. (English summary) (18 ref)—A. G. Pook.

2122. Vorobyova, T. M. (Research Inst of Neurology & Psychiatry, Kharkov, USSR) [Neuropharmacological analysis of cholinergic mechanisms of self-stimulation reactions.] (Russ) *Zhurnal Vyssheĭ Nervnoĭ Deyatel'nosti*, 1974(Jan-Feb), Vol 24(1), 172-180.—Studied the effect of cholinomimetic and cholinolytic agents on the reaction of posterior hypothalamic self-stimulation on 32 rats. Results show that eserine and acetylcholine inhibited self-stimulation reactions after parenteral and intracranial injections into the old zones. Atropine, amizyl, and pentamine activated self-stimulation reactions. Cholinomimetic microinjections in the hippocampus region inhibited the reactions of posterior hypothalamic self-stimulation. The method by which cholinergic mechanisms function as an inhibitory process in the self-stimulation reactions, and the effects exhibited are discussed. (English summary) (35 ref)—*Journal abstract.*

2123. Wickelgren, Wayne A. (U Oregon) **Alcoholic intoxication and memory storage dynamics.** *Memory & Cognition*, 1975(Jul), Vol 3(4), 385-389.—In an experiment with 10 paid adult university student volunteers, strength retention functions were obtained for English words from 2 to 50 min within a continuous recognition memory session and from 1 to 14 days subsequent to the session, with Ss being sober or moderately intoxicated. A small, but significant, decrement was obtained in memory performance under alcoholic intoxication. However, there was no difference in forgetting rate either within the continuous session or over the subsequent 1-14 day period. Single-trace fragility theory provides an excellent fit to the data. The entire effect of alcoholic intoxication was on degree of learning with no effect on the form of the retention function or rate of forgetting. No state-dependent retrieval effects were obtained. White noise during learning and/or retrieval had no

effect on acquisition, storage, or retrieval. (20 ref)—*Journal abstract.*

2124. Wilson, C. Scott & Wong, Roderick. (U British Columbia, Vancouver, Canada) **Aldactazide-induced consummatory and operant responding to sodium by rats.** *American Journal of Psychology*, 1975(Sep), Vol 88(3), 377-384.—Conducted 2 experiments with a total of 20 Long-Evans hooded rats to study the effects of ip injections of aldactazide-A on Ss' consumption of water and saline solution (.51 M NaCl). During the treatment sessions, Ss showed a substantial increase in saline consumption and in leverpressing to a cue light to obtain the saline, as compared with their negligible intake before the injections and after the injections had been discontinued. Results indicate that both the drinkometer and operant-box measures are sensitive to the natriuretic effects of aldactazide.—*Journal abstract.*

2125. Wiśniewski, Konstanty & Bodzenta, Anna. (Medical School, Białystok, Poland) **Kinins and central effects of acetylcholine.** *Acta Neurobiologiae Experimentalis*, 1975, Vol 35(1), 85-92.—Studied the interaction between kinins formed in the CNS and acetylcholine (ACh), using 200 rats. Endogenous ACh in excess acted psychodepressively on behavior as evaluated with J. Lat's (1965) test. A more intense effect was obtained from Ss in which the activity of kinin-forming enzymes in the nervous tissue had been increased with either kallikrein or bradykinin. Both kallikrein and bradykinin intensified the psychodepressive action of exogenous ACh injected into the brain ventricle. Results show that kinins can enhance the inhibitory central action of ACh. (19 ref)—*Journal abstract.*

2126. Wolkenberg, Robert C.; Gold, Calman & Tichauer, Erwin R. (New York U, Ctr for Safety & Inst for Rehabilitation Medicine, Div of Biomechanics) **Delayed effects of acute alcoholic intoxication on performance with reference to work safety.** *Journal of Safety Research*, 1975(Sep), Vol 7(3), 104-118.—9 male Ss were administered a series of tests that took place before, during, and after an evening of social drinking: an eye/hand coordination device, a task board requiring precise object positioning, and a lordosimeter to test changes in spinal configuration during performance of a static load-holding task. Delayed effects observed up to 18 hrs after ingestion included lengthened reaction time, poor motor performance, decreased motor sensory skill, and post-alcohol effects on subjective mood. (34 ref)

COMMUNICATION SYSTEMS

2127. Beler, Ernst G. (U Utah, Clinical Training Program) **Subtle language.** *Humanitas*, 1975(May), Vol 11(2), 175-187.—Distinguishes 5 categories of nonverbal communication. 2141. **Zahn, G. Lawrence.** (U California, Graduate School of Administration, Riverside) *Verbal-vocal integration as a function of sex and methodology.* *Journal of Research in Personality*, 1975(Sep), Vol 9(3), 226-239.—Suggested that the process by which persons appear to combine content and intonation to form an impression of a speaker's friendliness may be a function of sex and the analytical techniques used to evaluate the models. 30 male and 30 female 17-50 yr old Ss from the campus population were asked to rate the content, tone, and total message of short sentences from male speakers. Analysis of variance and regression analysis were used to evaluate linear, multiplicative, minimum, and maximum models. Responses were essentially linear, although the multiplicative component was significant in some results, and the minimum model received some support for males. More weight was given to tone than content, especially by females and for inconsistent messages. Idiographic analysis proved superior to normative analysis, and the ignored content method provided greater reliability and

explanation than previously used filtered speech. (27 ref)

Literature & Art

2142. Ackermann, Jean M. (Claremont Graduate School) **Outsiders in India: How Western characters are perceived in writings of Kamala Markandaya and R. Praver Jhabvala.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1684.

2143. Brose, Patricia B. (U Nebraska) **An analysis of the functioning of gothic themes in the folklore and writing of children in the second and the fifth grades.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2154.

2144. Endres, Rolf C. (U Regensburg, W Germany) **Understanding the lifestyle of a medieval literary character.** *Journal of Individual Psychology*, 1974(Nov), Vol 30(2), 251-264.—Presents an Adlerian analysis of the main female character of H. von Aue's poem "Der Arme Heinrich." Interpretations discussed suggest that human behavior in the Middle Ages was only partially socially conditioned.

2145. Ginn, Robert M. **Psychodrama: A theatre for our time.** *Group Psychotherapy & Psychodrama*, 1974, Vol 27(1-4), 123-146.—Views theater as a place to discover the magic power of a community of people coming together to share in a performance of live human beings. It involves more of a healing, religious experience than the occasional brilliance of interaction between actor and audience. As civilization developed, the distance in the actor between his personal experience (his spontaneity and creativity) and the experience as communicated to the audience became greater. Revitalization of the theater requires dealing with the alienation of the actor from himself. The approaches of 5 directors are described.—R. Tomasko.

2146. Gordon, William A. (U Kentucky) **Submission and autonomy: Identity patterns in Joyce's Portrait.** *Psychoanalytic Review*, 1974-1975(Win), Vol 61(4), 535-555.—Discusses the transforming nature of imagination through which an author changes his life history into objective dramatic art. The poet or novelist discovers an essential change in his relationship to the materials of his own experience, so that where art had only been one of his activities, he now exists for his art alone. J. Joyce's *A Portrait of the Artist as a Young Man* illustrates the process. Although psychological critics have ignored or misunderstood the transformation of life experience into art, Joyce understood it well.—G. S. Speer.

2147. Miller, John W. & Hintzman, Charles A. (Wichita State U) **Syntactic complexity of Newbery Award winning books.** *Reading Teacher*, 1975(May), Vol 28(8), 750-756.—Analyzed for syntactic complexity 3,500-word samples from each of 20 children's books which had won the Newbery Award, using 6 word count measures specially devised for the study. These "synthetic" measures are distinguished from "inherent" measures such as the Synthetic Complexity Formula (SCF) suggested by M. Botel, J. Dawkins, and A. Granowsky (1971, 1973). Methods of selecting, scoring, and analyzing the samples are described in detail. Scores obtained on the samples by the SCF and the "synthetic" measures were compared. All the synthetic measures were signifi-

cant predictors of scores on the SCF, and 3 of them had particularly strong positive correlations: overall length of sentence, number of words between subject noun and end of sentence, and number of words between main verb and end of sentence. The greater ease of computation of sentence length makes it the preferred predictor. Other applications of the 6-measure technique are briefly considered.—P. D. Leedy.

2148. Neumann, E. [Franz Kafka: *The Judgment: A Depth Psychological Interpretation.*] (Germ) *Analytische Psychologie*, 1974, Vol 5(4), 252-306.

2149. Panken, Shirley. **Some psychodynamics in *Sons and Lovers*: A new look at the Oedipal theme.** *Psychoanalytic Review*, 1974-1975(Win), Vol 61(4), 571-589.—Discusses the central theme of D. H. Lawrence's *Sons and Lovers*: the symbiosis between the mother and her sons. Generally felt to depict a classic oedipal theme, it is interpreted here as the mother's tenacious hold on Paul, the 2nd son, to replace the intense relationship with William, the 1st son, which terminated at his death. This in turn had developed to compensate for the failed marriage with a devalued husband. Paul was not as interested in obliterating his father as in placating his mother. Paul is impeded in the resolution of phase-specific tasks by contrapuntal behavior dynamics, particularly the mother's early ambivalence and the birth of a younger brother. It is noted that all of Lawrence's novels are affected by the interplay between life and fiction, and this one is influenced by his intense and prolonged personal crisis at the death of his mother. (47 ref)—G. S. Speer.

2150. Sadoff, Dianne F. (U Rochester) **Waste and transformation: A psychoanalytic study of Charles Dickens's *Bleak House* and *Our Mutual Friend*.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2653-2654.

2151. Skorburg, Mary E. (Skidmore Coll) **An Adlerian interpretation of H. G. Wells' *The Invisible Man*.** *Journal of Individual Psychology*, 1975(May), Vol 31(1), 85-96.—Compares Wells' use of the "as if" hypothesis to A. Adler's development of Individual Psychology. Wells' approach to the main character is compared to that of an Adlerian therapist.

2152. Yamamoto, Joe & Iga, Mamoru. (U Southern California, Medical School) **Japanese suicide: Yasunari Kawabata and Yukio Mishima.** *Journal of the American Academy of Psychoanalysis*, 1975(Apr), Vol 3(2), 179-186.—Compares the life histories, literary contributions, and suicidal behaviors of 2 renowned authors. Mishima and Kawabata, to explain the dynamic significance of suicide in Japan's culture.

DEVELOPMENTAL PSYCHOLOGY

2153. Bhana, Kastoor. (U Durban-Westville, South Africa) **Preference for human versus animal figures in picture material.** *Journal of Behavioural Science*, 1974, Vol 2(2), 87-89.—Parents of 52 5-yr-old Indian nursery schoolers completed questionnaires pertaining to the children's home backgrounds and exposure to English literature. 30 of the children were subsequently tested to determine whether their preferences for animal figures in

picture material were related to their exposure to literature. A significant relationship was found. Practical suggestions from the findings are discussed, and research possibilities are suggested.—*Journal abstract*.

2154. Cochran, Montcrieff M. (U Michigan) **A comparison of nursery and non-nursery childrearing patterns in Sweden.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1692.

2155. Fowler, William. (Ontario Inst for Studies in Education, Toronto, Canada) **How adult-child ratios influence infant development.** *Interchange*, 1975, Vol 6(1), 17-31.—Presents evidence supporting the position that good adult-child ratios are a necessary though not a sufficient condition for optimum child development. Poor ratios (greater than 1:7) limit development while high quality ratios (1:2 or 1:1) often result in outstanding development. Data indicate that ratio improvements within an environment result in improved development, and that outstanding development occurs only with ratios of 1:3 or less. Alternative models for providing low-ratio day care without excessive costs are discussed. (90 ref)—H. E. Yaker.

2156. Nanpon, Hubert. (U Haute-Bretagne, Rennes, France) **[Temporal organization of verbal responses of six year old children describing drawings.]** (Fren) *Enfance*, 1975(Jan-Apr), No 1, 93-109.—Tested the hypothesis that perception of pictures follows definite laws. 19 boys and 13 girls, median age 5 yrs 11 mo, were shown 4 line drawings and asked to tell what they saw. For 2 of the pictures only enumeration occurred in 92% of the cases; for the other 2 pictures, enumeration occurred in 59%. The principal findings were that objects are named more frequently than parts of objects and that there is a positive correlation between the frequency with which elements are named and their priority of perception. These findings are considered relevant to psycholinguistics. (English summary)—S. S. Marzolf.

2157. Neuhauser, Gerhard. (U Wisconsin, H. A. Waisman Ctr on Mental Retardation & Human Development, Madison) **Methods of assessing and recording motor skills and movement patterns.** *Developmental Medicine & Child Neurology*, 1975(Jun), Vol 17(3), 369-386.—Literature on assessment and recording of motor skills and movement patterns in children is reviewed from a clinical and instrumental point of view. (French, German, & Spanish summaries) (144 ref)—P. W. Pruyser.

2158. Norton, Natalie J. (Boston U, School of Education) **Symbolic arts: The effect of movement and drama upon the oral communication of children in Grade two.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1491.

2159. Perry, P. Wingfield. **The night of ageism.** *MH*, 1974(Sum), Vol 58(3), 13-20.—Discusses the effects of selected myths on the aged and some of the problems associated with becoming old in the US, including poor nutrition, inadequate health care, confusion, and depression. Some of the special problems encountered by aging Blacks are outlined, and suggestions for eliminating the problems are presented.—M. E. Pounsel.

2160. Rogers, Sinclair (Ed). (Sheffield Polytechnic, England) **Children and language: Readings in early**

language & socialization. London, England: Oxford U Press, 1975. ix, 346 p.

2161. Savitz, Harry A. (Hebrew Rehabilitation Ctr for the Aged, Boston, MA) **Mental health and aging.** *MH*, 1974(Sum), Vol 58(3), 21-23.—Discusses aging from a problematic-solution point of view. It is suggested that life is a continual process of adaptation to its many stages.—B. E. Allen.

2162. Schmidt, Katalin. (Albert Einstein Coll of Medicine, Yeshiva U) **The effect of continuous stimulation on the behavioral sleep of infants.** *Merrill-Palmer Quarterly*, 1975(Apr), Vol 21(2), 77-88.—Reviews research on sleep in infants, concentrating on the effects of continuous or monotonous stimulation. Stimuli in the reviewed studies include continuous auditory stimulation (e.g., white noise, heartbeat sounds, and metronomes); constant lighting; elevated temperatures; and rocking. Compared to intermittent stimulation or no stimulation at all, monotonous stimuli appear to cause more rapid onset of sleep, longer sleep duration, and longer duration of quiet (NREM) sleep. Continuous stimulation also appears to lower heart rate and motor activity and cause more regular heartbeat and breathing rate. It is suggested that abnormal sleep patterns may be normalized through the use of continuous stimulation. (68 ref)—W. R. Street.

2163. Simounet, Claude. **[Left orientation dominance in the drawings of children and adults.]** (Fren) *Enfance*, 1975(Jan-Apr), No 1, 47-69.—Researches on the predominance of left orientation of drawings, first reported in 1905, have suggested that it is a function of handedness, social stereotypy, mechanisms of reading, or whether or not movement is represented. Since none of these hypotheses is adequate, it is suggested that left-right orientation must be a function of the interaction between left and right central organizations (which are equally frequent) and social pressures. (English summary) (42 ref)—S. S. Marzolf.

Cognitive & Perceptual Development

2164. Altman, Rita C. (Temple U) **An analysis of the spontaneous language of selected urban five year olds through the use of the Piaget language categories.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2150.

2165. Baron, Jonathan & Kaiser, Anne. (U Pennsylvania) **Effect of inconsistent distinctiveness of artificial semantic features on retrieval speed.** *Journal of Psycholinguistic Research*, 1975(Oct), Vol 4(4), 303-317.—In the presence of the E and 2 dolls, 74 3-5 yr olds were asked to respond to sentences containing pronouns which required distinctions to be made on the basis of person, number, and gender, e.g., "Point to my (your, his, her, our, their) feet." Errors tended to maintain distinctions; e.g., we was treated as if it meant I (maintaining first person) or they (maintaining plural) more often than could be accounted for by a response-bias model. Furthermore, there were consistent individual differences in the kinds of distinctions that were difficult; some Ss had more trouble with number, others with person. These findings support the notion that errors made during acquisition result from dropping only part of the correct meaning and suggest that individuals may differ in the relative strengths of different components.—*Journal abstract*.

2166. **Beinema, J. & Loffeld, M.** Temporal indications used by Dutch-speaking children. *Communication & Cognition*, 1974, Vol 7(2), 257-270.—Discusses how children acquire the concept of time. Evidence based on speech patterns of Dutch children suggests that the child first places events in time using personal experiences, then gradually learns to do so in a more objective way, and finally learns to talk about time.—R. L. Cook.

2167. **Bell, John A.** (U Arizona) The effects of modeled and instructed rehearsal as a function of age on short-term memory. *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1121.

2168. **Buchanan, Barbara A.** (Pennsylvania State U) A developmental study of cognition by content analysis of children's written and oral narrations. *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1688.

2169. **Coleman, Sandra B.** (Temple U) The effect of aging on Piaget's developmental stages: A study of cognitive decline. *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1122-1123.

2170. **Feltzer, M. J.** (Katholieke Hogeschool, Psychologisch Lab, Tilburg, Netherlands) [Development of temporal integration in the perceptual process.] (*Dutch*) *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1975(Jun), Vol 30(4-5), 363-384.—Examines the process of temporal integration, as described by J. F. Wohlwill (1965), J. Bruner et al (1968), and J. M. Belmont (see PA, Vol 48:12058). 5-, 7-, 9-, and 11-yr-olds were tested on the ability to recognize simple visual forms when the lines for such forms were presented sequentially. The total time of presentation varied from 4 to 13.5 sec. The number of lines (elements of the forms) were either 3 or 5. Results indicate independent influences of the total time-span and the number of elements for the 4 age levels. The age range of 5-7 yrs was determined to be a crucial period in the development of temporal integration. (38 ref)—A. J. Ter Keurst.

2171. **Fijalkow, Jacques.** (CNRS, U Toulouse-Le Mirail, Equipe de Recherches, France) [Differentiation and discrimination in the formation of color concepts in children.] (*Fren*) *Enfance*, 1975(Jan-Apr), No 1, 83-92.—To study the processes of differentiation and discrimination of color concepts, infants 2.1-4.6 yrs old were given a series of naming and designation tests 3 times at intervals of 3 mo. The original samples consisted of 204, but at the 2nd and 3rd tests the numbers were 140 and 103 respectively. There was no appreciable loss in sample size thereafter. Results indicate that differentiation and discrimination progress along the dimensions of wave length and brightness. (English summary) S. S. Marzolf.

2172. **Flugsrud, Marcia R.** (State U New York, Albany) An analysis of the relationship between the concave parabolic curve and selected personality variables as an age-related phenomenon. *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1124-1125.

2173. **Fulton, Robert T.; Gorzycki, Pamela A. & Hull, Wilma L.** (Parsons State Hosp, Research Ctr, KS) Hearing assessment with young children. *Journal of Speech & Hearing Disorders*, 1975(Aug), Vol 40(3), 397-404.—Evaluated the efficacy and reliability of auditory stimulus response control training and assess-

ment procedures with 12 9-12 mo olds. The problems encountered in training stimulus-response control are discussed. Results indicate that reliable interest data can be obtained from young children using stimulus-response procedures.—*Journal abstract*.

2174. **Gardner, Howard & Lohman, William.** (Harvard U, Project Zero) Children's sensitivity to literary styles. *Merrill-Palmer Quarterly*, 1975(Apr), Vol 21(2), 113-126.—Hypothesized that the appreciation of literary style, like the appreciation of stylistic elements of visual art, develops with increasing age. 84 subjects aged 7, 11, 14, or 19 yrs were asked to listen to tape recordings of 12 literary passages. Each passage was followed by 2 test passages that varied on 4 levels of style-vs-content similarity to the original passage. Ss chose 1 test passage as coming from the same work as the original. Stylistically similar choices were increasingly frequent with increasing age. Choices of younger Ss tended to be dictated by content similarities. Verbal reports of the importance of style similarities followed the same age development pattern. Preference for style similarity varied with the levels of style-vs-content similarity in the test passage pair. (19 ref)—W. R. Street.

2175. **Gauté, J. & Wittwer, J.** [The genesis of the articulation of syntactic constructions called "circumstantial complements."] (*Fren*) *Bulletin de Psychologie*, 1974-1975, Vol 28(16-17), 844-856.—Tested the hypothesis that the ability of Ss 8-12 yrs old to articulate syntactic constructions is founded on the operation of mental processes which can be observed through analysis of circumstantial complements: time, place, manner, motive, and purpose. 23 students were assigned to each of the 5 age groups (8-12 yrs). Analysis of responses to the written experimental task indicates that Ss progressively elaborated functional (rather than conditional) syntactic constructions from correspondences, similarities, and diverse relations. A model is suggested (complementary to traditional models analyzing the development of concepts of causality in children) which would focus on mental processes operating as the individual moves from deduction of concrete constructs to the level of symbolic representation and the interactions of "circumstantial complements."—Z. M. Cantwell.

2176. **Hamilton, Brett B.** (U California, Los Angeles) Control of the conservation response through discrimination learning set training for conserving and nonconserving transformations. *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1701.

2178. **Hill, Earl L.** (State U New York, Buffalo) A study of the performance of two-year-olds on five cognitive tasks as related to levels of maternal formal education and aspects of home environment. *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2423.

2179. **Howland, Ann; Rashbury, Wiley; Heilman, Kenneth M. & Hammer, Lowell.** (U Florida) The development of auditory figure ground discrimination and ear asymmetry under monaural stimulus presentation. *Developmental Medicine & Child Neurology*.

1975(Jun), Vol 17(3), 325-332.—Asked 56 normal schoolboys to discriminate 50 single-syllable words against 4 levels of background noise. Increasing age (kindergarten to Grade 6) did produce better ability for auditory word discrimination, but a greater effect was produced by the signal-to-noise treatment level. (French, German, & Spanish summaries) (29 ref)—*P. W. Pruyser*.

2180. Inhelder, B.; Blanchet, A.; Sinclair, A. & Piaget, J. (U Genève, Faculté de Psychologie et des Sciences de l'Education, Switzerland) [Relations between conservation of groups of discrete elements and of continuous quantities.] (Fren) *Année Psychologique*, 1975, Vol 75(1), 23-60.—Verified the hypothesis that no direct relationship exists between the 2 conservation forms of numerical totalities and continuous quantities; instead, a process of differentiation and interaction serves to outline the mechanism precisely. The idea underlying principles of quantity conservation is that every change in form of a totality can be understood as a displacement of elements of the totality, so that what has been removed in one place equals what is added elsewhere. The experiments, utilizing young children's responses to black counters in and around geometric figures, throw light on the notion of a "general commutability" that plays a role in the development of the elementary quantification of continuous object and discrete collections.—*G. Rubin-Rabson*.

2181. Janssen, David R. (Pennsylvania State U) **Effects of visual and auditory perceptual aptitudes and letter discrimination pretraining on word recognition.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1130.

2182. Kováč, Štefan. (KPVK, Banská Bystrica, Czechoslovakia) [Motor activity as a functional component of some mental processes: A generalization.] (Czech) *Československá Psychologie*, 1974, Vol 18(2), 157-172.—Studied the effect of motor reproduction of geometric designs (sketching them) on achieving the categorization principle. The hypothesis was tested that with motor reproduction fewer stimulus cards would need to be presented to originate the concept. Data were obtained from 120 5th-grade pupils, considered to be in J. Piaget's concrete operations stage, and selected from 484 students as most alike on 5 intelligence factors, grades, and CA. They were subdivided into a 2 × 2 factorial design dichotomized for CA and for order of presenting the motor task. That students verbalized the generalization significantly sooner with the motor procedure but did not differ in placing the designs accurately suggests that motor behavior does influence generalization of concepts but not perception. (Russian & English summaries) (16 ref)—*P. Babarik*.

2183. Kuczaj, Stan A. & Maratsos, Michael P. (U Minnesota, Inst of Child Development) **What children can say before they will.** *Merrill-Palmer Quarterly*, 1975(Apr), Vol 21(2), 89-111.—Describes the stages of language acquisition by a 2½-yr-old boy. The auxiliary verbs "can" and "will" were presented in grammatically correct and incorrect declarations and questions. The S was asked to imitate each sentence. At the 1st testing, he was not using "can" and "will" in his spontaneous speech, but he could use grammatical declarations and questions and would correct ungrammatical declara-

tions, but not ungrammatical questions. 2 mo later, S was using "can" and "will" in simple sentences. He could imitate their correct use and correct ungrammatical declarations and questions. Orderly stages of language development are discussed. (27 ref)—*W. R. Street*.

2184. Nishikawa, Kazuo. (Mie U, Faculty of Education, Tsu, Japan) **Analysis of structural change of intelligence and genetic relations: A nine year follow-up study.** *Psychologia: An International Journal of Psychology in the Orient*, 1975(Mar), Vol 18(1), 1-14.—Used cluster analysis to reanalyze H. Kan's (1962) data from a 9-yr follow-up study of 228 children, repeatedly measured with the Suzuki version of the Stanford-Binet Intelligence Scale. Results show that (a) differentiation of intelligence was generally supported; (b) verbal thinking ability contributed largely to intellectual development through 9 yrs; (c) memory ability became differentiated from thinking ability at early periods and more clearly specialized as age advanced; (d) memory ability in the early period was highly correlated with verbal thinking ability in the later period; and (e) developmental stages which corresponded respectively with Piaget's period of preoperational thought, period of concrete operations, and period of formal operations were found. (23 ref)—*Journal abstract*.

2185. O'Malley, John J.; Dunn, Daniel & Rudnick, Paul. (U Scranton) **Amount of training, age of subject, and perseveration in reversal learning.** *Journal of General Psychology*, 1975(Oct), Vol 93(2), 261-268.—A review of reversal learning data obtained from Ss of various developmental levels suggests that overtraining increases perseveration in preschool children and decreases perseveration in older (e.g., 1st grade) children. The present experiment tested this apparent trend. 96 children in 2 age groups (3-5 yrs and 5½-7½ yrs) learned a reversal shift after being trained to a 9 of 10 criterion, or after 20 or 40 additional overtraining trials. Results indicate that overtraining had had no effect upon perseveration in the younger Ss and increased perseveration in the older Ss, failing to confirm the apparent developmental trend. It was also found that criterion-trained younger Ss perseverated more than did criterion-trained older Ss but that this age difference disappeared in the overtraining conditions. Finally, it was found that ease of overall reversal learning was unaffected by the amount of original training in both age groups. (21 ref)—*Journal abstract*.

2186. Oerter, Rolf; Mandl, Heinz & Zimmermann, Achim. (U Augsburg, Inst für Unterrichtsforschung am Erziehungswissenschaftlichen Fachbereich, W Germany) **[New findings concerning the differentiation hypothesis of intelligence.]** (Germ) *Zeitschrift für Entwicklungspsychologie und Pädagogische Psychologie*, 1974, Vol 6(3), 151-167.—Tested 1,511 2nd graders on the BT 2-3 Intelligence Test and the Primary Mental Abilities Test. 1 yr later, Ss were retested on the same instruments and 678 3rd graders were added to the S population. Findings show no difference between cognitive structures of different samples on the same age population, but differences between samples of different age populations are reported. Results reveal comprehension of instruction to be an important variable of socialization for interpreting longitudinal cognitive shifts. It is postulated

that change of cognitive structure associated with CA might indicate change in processes employed in problem; results are, therefore, qualified with respect to factor analytic results as used in this study, which may not be very useful in measuring developmental-cognitive trends. (25 ref)

2187. Pacheco-Maldonado, Angel M. (State U New York, Albany) **A cognitive-developmental study of moral judgments in Puerto Rican children.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1138-1139.

2188. Scarlett, Helaine & Press, Allan. (Clark U) **An experimental investigation of the phenomenon of word-realism.** *Merrill-Palmer Quarterly*, 1975(Apr), Vol 21(2), 127-137.—A child's recall of a story is likely to be distorted if one of the characters has the same name as the child. This restructuring can be explained both by egocentricity, giving realism to the name-word in the story, and by simple familiarity with one's own name, causing greater recall of name-related events. Stories were read to 30 children from each of the 1st, 3rd, and 5th grades. Each story had one character with the child's own name, a best friend's name, or an unfamiliar name and a second character with an unfamiliar name. Restructured recall was most evident in the own-name stories and least evident in the unfamiliar name stories. Restructuring decreased with increasing age. Results support the hypothesis that egocentricity, not familiarity, is responsible for cognitive restructuring. (19 ref)—*W. R. Street*.

2189. Shick, Jacqueline & Plack, Jeralyn J. (U Minnesota, School of Physical Education & Recreation) **The young child's perception of weight as a function of color.** *Journal of the Association for the Study of Perception*, 1975(Spr), Vol 10(1), 10-16.—Studied the perception of weight as a function of color and color value in 28 4-yr-olds. Ss were tested twice at an interval of 1 wk. It was found that 4-yr-olds did not perceive weight as a function of color or color value; failed to respond consistently within and across test sessions; and responded significantly more often to the last than to the first stimulus in a question.—*J. M. Kleinman*.

2190. Sugimura, Takeshi & Terao, Yoko. [Children's concepts assessed by the abstraction and the identification tests.] (Japn) *Japanese Journal of Educational Psychology*, 1975(Jun), Vol 23(2), 97-103.—Studied how children 4 and 6 yrs old attain superordinate and subordinate concepts by using 2 approaches: abstraction and identification. The abstraction test was designed to assess the ability to abstract a concept common to 2 or more instances. The identification test was designed to assess the ability to elicit instances from concepts. 30 4-yr-olds and 30 6-yr-olds performed better on the identification test than on the abstraction test ($p < .01$). The age difference was greater in the abstraction than in the identification test ($p < .01$). In the abstraction test Ss attained subordinate concepts better than superordinate concepts ($p < .01$). Developmental aspects are discussed. (English summary)—*S. Choe*.

2191. Thomsen, Stephen J. (State U New York, Albany) **Pictorial and verbal stimuli and order of presentation in children's associative learning.** *Disserta-*

tion Abstracts International, 1973(Oct), Vol 34(4-A), 1717-1718.

2192. Van der Geest, Ton. (U Amsterdam, Inst for General Linguistics, Netherlands) **Language acquisition as a hidden curriculum.** *Communication & Cognition*, 1974, Vol 7(2), 169-190.—Contrasts the language acquisition and language learning theories of language development; the former assumes that innate structures are necessary, while the latter assumes that sufficient primary data are available for the child to learn the linguistic system. The language learning position is supported, and evidence suggests that the hidden processes involved differ at different stages of development. The relevance of this theoretical approach to language education is discussed. (44 ref)—*R. L. Cook*.

2193. Weeks, Ruth T. (Kent State U) **The relationship of grade, sex, socio-economic status, scholastic aptitude, and school achievement to formal operations attainment in a group of junior high school students.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2405.

2194. Weener, Paul. (Pennsylvania State U) **Toward a developmental model of auditory processes.** *Acta Symbolica*, 1974, Vol 5(2), 85-104.—Discusses the central processing of structured auditory stimuli, with some attention to the short-term storage processes which influence auditory perception. (25 ref)—*M. Cynamon*.

2195. Wood, Nancy E. (U Southern California) **Auditory closure and auditory discrimination in young children.** *Acta Symbolica*, 1974, Vol 5(2), 67-84.—Studied 2 aspects of auditory perception which are particularly important to speech and language development. Tapes were used to develop auditory tests based on (a) environmental sounds in artificial and playground noise, (b) competing messages, and (c) digit and syllable sequences. The results of the factor analysis of 18 variables are presented and discussed. (16 ref)—*M. Cynamon*.

Psychosocial & Personality Development

2196. Adler, Alfred. **The child: Neither good nor evil.** *Journal of Individual Psychology*, 1974(Nov), Vol 30(2), 191-193.—Discusses the issue of human nature being all good or all evil. The potential for awakening either the evil or the good instincts in a child is acknowledged. Dormant potentials are by their nature neither good nor bad; they mature in the 1st yrs of childhood with the influence of the mother as the determining factor. The father, the family, and the environment have an important part to play in not disturbing the successful work of the mother. Pampering, suffering, and child neglect are the roots of a development toward the bad.—*R. Tomasko*.

2197. Burger, Mary L. (Northern Illinois U) **A comparative study of self esteem among young Black, Spanish, and White children.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1689.

2198. Doise, Willem & Mugny, Gabriel. (U Geneva, Faculte de Psychologie et des Sciences de l'Education, Switzerland) [Sociogenetic research on the coordination of interdependent actions.] (Fren) *Psychologie: Schweizerische Zeitschrift für Psychologie und ihre Anwendungen*, 1975, Vol 34(2), 160-174.—3 experiments using a

"Cooperation Game" were designed to provide data on group vs individual performance at different ages. A total of 136 children participated in tasks carried out either alone or with 1 or 2 partners. It is concluded that (a) only at an early stage of development is the group's performance superior to that of individuals; (b) verbal exchanges improve the group's performance only if the coordinations necessary for the tasks are not yet individually acquired; and (c) when a hierarchical structure is imposed on the group, performance is perturbed only in Ss who are at the level where the coordinations are not yet fully acquired. (English & German summaries)—*E. Coché*

2199. **Eckerman, Carol O. & Whatley, Judith L.** (Infants' reactions to unfamiliar adults varying in novelty.) **Infants' reactions to unfamiliar adults varying in novelty.** *Developmental Psychology*, 1975(Sep), Vol 11(5), 562-566.—Assessed the 10-mo-old infant's reactions to a new adult as a function of the relative novelty of the adult. Each of the 12 Ss, in an unfamiliar environment with his mother, first faced a new adult who sat at a distance and responded simply to his overtures. In a 2nd contrast trial he faced the same new adult (familiarized adult) and another adult never before seen (novel adult). Ss reacted by looking and smiling at the new adults, but they smiled reliably more often at a more novel adult, whether the contrast was drawn between the initial minute with a new adult and later minutes or between the novel adult and the familiarized adult. Results are consonant with the proposition that the infant's smiles at new persons represent his active exploration of them.—*Journal abstract.*

2200. **Gadpaille, Warren J.** **Adolescent sexuality: A challenge to psychiatrists.** *Journal of the American Academy of Psychoanalysis*, 1975(Apr), Vol 3(2), 163-177.

Discusses the traditional psychoanalytic concept of the place of adolescent coitus in psychosexual development. The apparently large proportion of sexually active and healthy youngsters goes largely unnoticed; analytic theory has developed with minimal understanding of their dynamics. The importance of learning about childrearing practices that protect the adolescent from emotional damage and allow coitus to be a developmental experience is stressed. Research findings on adolescence and intercourse are presented. (36 ref)—*R. Tomasko.*

2201. **Greenberg, Harvey R.** **The widening gyre: Transformations of the omnipotent quest during adolescence.** *International Review of Psycho-Analysis*, 1975, Vol 2(2), 231-244.—Examines the ways adolescents use the inheritors of parental prerogative to work through omnipotent strivings. Examples from clinical practice, literature, and current and past social scenes are used to illustrate normal and pathological variations of the omnipotent quest. Topics discussed include the friend, the 1st heterosexual love, the hero and sidekick, and the peer group. The desire for omnipotence always is linked to the fear of death.—*R. Tomasko.*

2202. **Grien, Arno.** **The discontinuity in the ontogeny of self: Possibilities for integration or destructiveness.** *Psychoanalytic Review*, 1974 1975(Win), Vol 61(4), 557-570. Infants develop by moving toward new and beneficial sources of stimulation. Through the mother's

responsiveness the infant experiences itself as a living human being who matters and as a functioning entity in relation to its surroundings. When the mother withdraws (for whatever reason), the child must maintain the life-giving bond by shifting blame for the lost happiness from the external source, the mother, to within himself. This means that he begins to live in a fantasy world. The many, complex, and destructive effects of these fantasies are discussed and illustrated. (20 ref)—*G. S. Speer.*

2203. **Gutton, Ph.** (U Paris VII, Lab of Pathological Psychology & Psychoanalysis, France) **[Remarks on denial, based upon pediatric observations.]** (Fren) *Bulletin de Psychologie*, 1974-1975, Vol 28(13-15), 669-677.—The clinical observations recorded in this article form part of the base for identifying denial as a mechanism of defense with regard to annoyance and grief among young children. Denial, as a mechanism of defense, appears in the first weeks of life and has some foundation in the quality of early mother/child relations. (24 ref)—*Z. M. Cantwell.*

2204. **Hamana, Akiyo.** **[The effect of inequity upon distributing behavior of children.]** (Japn) *Japanese Journal of Educational Psychology*, 1975(Jun), Vol 23(2), 114-118.—Studied how 3rd graders distribute rewards in response to the allocated inequity, and the effect of inequity on cooperative behavior. 3 experiments, using 256 Ss, were conducted. Each employed a factorial design involving sex, equity-inequity conditions, and personal relationship as independent variables, and distribution of rewards as the dependent variable, and each consisted of 3 stages: (a) manipulation of equity, (b) distribution of rewards in response to inequity, and (c) distribution for cooperative tasks. Results indicate that 3rd grade children actively try to adjust inequity conditions in order to maintain personal relationships with others, especially in cooperative situations and when the personal relationship is perceived as important.—*S. Choe.*

2205. **Hartup, Willard W.** (U Minnesota, Inst of Child Development, Minneapolis) **Aggression in childhood: Developmental perspectives.** *American Psychologist*, 1974(May), Vol 29(5), 337-341.—Studied 102 preschool children and 1st and 2nd graders, using a combination of time and event sampling procedures to observe aggressive events. Results indicate the older Ss were less aggressive per unit time than the younger, with older Black Ss significantly more aggressive than older Whites. Results suggest that the developmental course of human aggression may be best understood by a differential functional analysis, and that the distinction between instrumental and hostile aggression is heuristically valuable for studying aggression in early childhood. (19 ref)—*R. Tomasko.*

2206. **Howe, Margot C.** (Boston U, School of Education) **A comparison of the self-esteem, body image and movement-concept of adults in different age groups.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2258-2259.

2207. **Kersey, Katharine C.** (U Virginia) **The effects of male absence on impulsivity and self control in preschool children.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1704.

2208. Krebs, George M. (U Missouri, Columbia) **Parameters of a process conception of self.** *Journal of Individual Psychology*, 1974(Nov), Vol 30(2), 179-190.

Describes a conception of self having an existential as well as empirical validity. The interplay of the active and passive features of human existence is illustrated in the evolution of self. A reciprocal interaction of physical, biological, social, and psychological evolutionary processes characterizes self, and the self is the culmination of a continuing historical process. Neurotic verbalizations of one's shortcomings are considered to have no lasting impact on self, because they represent an attempt to exemplify, by force of will, an ideal in action. (16 ref) R. Tomasko.

2209. Lewis, Michael & Rosenblum, Leonard A. (Eds). (Infant Lab of Educational Testing Service, Princeton, NJ) **Friendship and peer relations.** New York, NY: John Wiley & Sons, 1975. xvi, 320 p.—Presents a collection of 11 papers which give comprehensive assessment of early peer relations in humans and animals. Topics include infant's social behavior that does not directly involve a relationship with a caregiver, the beginnings of friendship, developments in behavior with age mates during the 2nd year of life, and peer relations and the acquisition of language.

2210. Masters, John C.; Anderson, Elizabeth P. & Fitzpatrick, Lawrence J. (U Minnesota, Inst of Child Development) **Effects of relative nurturance and social power on observational learning and imitation.** *Journal of Research in Personality*, 1975(Sep), Vol 9(3), 200-210. —48 preschool children observed 2 models, one of whom (controller of resources) controlled rewards dispensed to the child and to the other model (rival consumer of resources). The nurturance of the controller was varied in terms of his relative generosity towards the S and rival consumer. Controllers were imitated to a greater extent than consumers only when the controller had been more nurturant to the child than to the rival consumer. Imitation of the controller and consumer were affected differently by the various conditions of nurturance, but Ss learning of each model's behaviors were affected similarly by the conditions. The learning and imitative performance of each model's behaviors were uncorrelated, and imitation of one model did not correlate with imitation of the other. However, the learning of the 2 models' behaviors was highly correlated.—*Journal abstract*.

2211. Merl, H. [Functional structures in early childhood.] (Germ) *Zeitschrift für Klinische Psychologie und Psychotherapie*, 1975, Vol 23(1), 70-86. —Discusses the expression, in certain behavioral patterns, of the development of intrapsychic structures. This is the individual interacting with his environment for his developmental needs. The beginning interaction at birth and the relatively few means of expression of the new born constitute favorable conditions for observing this interaction in its original field. The rules of behavior can be followed and the effect studied. It appears that neonatal ways of expression demand adequate answers for later normal development. 2 cases of disturbance in mother-child relations are presented as illustrations. S. D. Babcock.

2212. Mobley, E. David. **Ego-ideal themes in fatherhood.** *Smith College Studies in Social Work*, 1975(Jun), Vol 45(3), 230-252.—Examines aspects of the father's relationship to his latency-age son and focuses on the content of the father's idealizations that were expected to color this relationship. Theoretical and empirical studies suggest that some important characteristics of the complex subject of fatherhood may become identifiable when examined from the perspective of ego idealizations.—M. W. Linn.

2213. Morval, Monique. (U Montréal, Canada) **[Drawings of the family by children deprived of the father.]** (Fren) *Enfance*, 1975(Jan-Apr), No 1, 37-46. —Conducted 3 studies in which children were asked to draw an imaginary family. In Study 1 Ss were 10 boys and 10 girls 5 yrs old whose parents had been separated for at least 2 yrs. In Study 2 Ss were 30 boys and 30 girls 8-11 yrs old, whose parents had been separated at least 1 yr after the child was at least 5 yrs old, who were in the care of the mother but in some contact with the father but without a father substitute. In Study 3, Ss were 21 boys and 21 girls whose fathers had been dead at least 1 yr. In each study there was a control group of like age, number, and sex distribution who were living with both parents. Statistically significant differences between the experimental and control groups were found in each study and these differences support 3 general conclusions: (a) Children deprived of the father, for whatever reason, associate themselves with an earlier, happier time when both parents were present. (b) Those whose parents were separated showed a disturbed self-image, more anxiety, and more ambivalence toward the father. (c) Those whose fathers were dead showed more ambivalence toward the mother and toward themselves. (28 ref) —S. S. Marzolf.

2214. National Coordinating Ctr for the Study & Development of Filipino Children & Youth. **Play materials and play activities in early childhood development.** *Philippine Journal of Child Youth Development*, 1970(Jul-Dec), Vol 4(2), 1-44. —Examined the play materials and play activities of 900 2-6 yr old Filipino children when age, sex, socioeconomic status (SES), type of community, and region are considered. A 3-stage stratified quota sampling was used. Results show that children's play followed a sequence from solitary to group play. Children preferred older playmates until age 5 when they began preferring playmates in their own age group. Children differed in competitive behavior by type of region and community rather than by sex and SES. SES was a strong variable: poor children engaged in more make-believe. Sex identification through war or nonwar toys was common in urban areas, and a strong interest in nature was seen in the kinds of toys played with. Aggression of 2-5 yr olds was not related to toy preference, but it was for 5-6 yr olds. Children's play materials and play activities were left to chance. J. C. Figuerelli.

2215. Perron, R. (Lab d'Etude Génétique de la Personnalité, Gentilly, France) **[Elaboration of responses to the DPI, structure and theme.]** (Fren) *Enfance*, 1975(Jan-Apr), No 1, 15-36. —Analyzed 1000 responses by 300 Ss to the DPI (Personal Dynamics and Pictures test). Ss were in 5 age groups: 5, 7, 9, 12, and 14 yrs. 3

types of responses were found: (a) static (simple enumeration and description); (b) juxtaposed (naming independent activities logically unrelated and in unordered sequence); and (c) coordinated (describing logically connected sequences of events). As age increases, responses become logically and temporally organized about definite persons, and themes have more to do with expression-realization and investigation-assimilation. Findings are considered a contribution to the secondary elaboration process of psychoanalysis. (English summary)—S. S. Marzolf.

2216. Richmond, Bert O. & Vance, John J. (U Georgia, Coll of Education) **Cooperative-competitive game strategy and personality characteristics of Black and White children.** *Interpersonal Development*, 1974-1975, Vol 5(2), 78-85.—Examined social interaction expressed in either a cooperative or competitive mode as a function of personality, racial, or biological sex factors. The Arrow-Dot Test and the Circle Matrix Board were used with 240 8-12 yr old students in pairs of like sex and race. Results show that sex and racial differences were related to personality styles. Black children were more successful in employing cooperative game strategies than White children. Some personality characteristics of Black and of White children were found more likely to occur with cooperative than competitive behavior. (20 ref)—*Journal abstract*.

2217. Roberts, Donald F.; Hawkins, Robert P. & Pingree, Suzanne. (Stanford U, Inst for Communication Research) **Do the mass media play a role in political socialization?** *Australian & New Zealand Journal of Sociology*, 1975(Jun), Vol 11(2), 37-43.—Questionnaires concerning children's communication behavior related to public affairs media content, intra-family political discussions, political knowledge and attitudes, and family communication structure were administered to 75 6th graders and 196 10th graders in California just before a primary election. It is concluded that not only age and events affect various political socialization outcomes, but so too does the communication environment in which the child is reared. Family communication structure exerts a strong influence on the likelihood that teenagers will engage in politically relevant communication behaviors, as shown in previous research, and the present study shows that the effect can be extended to a younger sample of children than heretofore reported.—*Journal summary*.

2218. Russian, Renee B. **Idealization during adolescence.** *Smith College Studies in Social Work*, 1975(Jun), Vol 45(3), 211-229.—Idealization, a regular phenomenon during adolescence, is defined as a process of attributing ideal or perfect characteristics to objects such as movie stars, heterosexual partners, or peer groups. It is utilized adaptively from infancy to latency as the individual seeks narcissistic gratifications. Preoccupied with his own ever-changing body, the adolescent increases role diffusion as his identification with the parental figures lessens. Tension reduction and resolution by methods of the least action are rationales for use of this adaptive process, while the adolescent's intra-psychic environment is in structural upheaval and society is presenting a double-bind situation to the process of identity cohesion. Idealization is an important adaptive

skill used by the adolescent in his struggle to gain role autonomy, narcissistic equilibrium, and id-ego balance while reducing dependencies on parental figures. The degree of idealization indicates the degree of life adjustment, and is an important factor for therapists to consider in determining countertransference.—M. W. Linn.

2219. Safin, V. F. (Pedagogical Inst, Ufa, USSR) **[The stability of self-appraisal and the mechanism of its preservation.]** (Russ) *Voprosy Psikhologii*, 1975(May-Jun), No 3, 62-72.—Studied the stability and adequacy of self-evaluation and the evaluation of others, in terms of performance and of moral traits. A number of personality inventories and problem-solving situations were used. 286 6th graders and 267 9th graders participated. Stability and adequacy of self-evaluation in one activity did not predict the stability and adequacy of self-evaluation in another, or self-evaluation of moral traits. Stability and adequacy of self-evaluation in terms of the results of an activity depended not only on whether an individual was oriented toward self-evaluation but also on success in the activity. With age, however, dependency on success decreased and the relationship with the degree of significance of the activity to the individual increased. In general, self-evaluation appears to develop along with personality, and to be gradually restructured as the individual's social experiences multiply. It enters into the structure of self-awareness and shapes it; self-awareness, in turn, manifests itself in self-evaluation. (English summary) (21 ref)—L. Zusne.

2220. Selig, Sidney & Teller, Gerald. **The moral development of children in three different school settings.** *Religious Education*, 1975(Jul-Aug), Vol 70(4), 406-415.—Tested L. Kohlberg's stage theory of moral development in Grades 4-6 of 3 Jewish schools varying in socioeconomic level and degree of orthodoxy. Orthodox Jewish values regarding law appear contrary to the individualistic values reflected in Kohlberg's highest stages.—R. D. Kahoe.

2221. Solis, Miguela M. **Scientific bases of play in early childhood development.** *Philippine Journal of Child-Youth Development*, 1970(Jul-Dec), Vol 4(2), 45-50.—Discusses the scientific basis of play from the viewpoints of anthropology, psychology, and pedagogy. Some of the anthropological aspects that affect Filipino play are child-rearing practices, emphasis on sex-typing, type of community, family domination, and parents' laissez-faire attitude. Parents recognize the vital role of play but do not direct it toward an educational goal. Psychological aspects of play are development of neuromuscular control, mental relaxation, contribution to mental health, wide range of experiences, the basis of high mental processes, development of creativity, stimulation of the child toward dramatic expression and role models, fostering new skills, and permitting the child to participate in decision-making processes. Pedagogically play is seen from the viewpoint of socio-cultural development.—J. C. Figurelli.

2222. Yasgur, Bruce J. (Temple U) **The relationship between perceived stressful environmental stimuli and manifest anxiety in upper elementary school children of different socio-economic and racial backgrounds.** *Dis-*

sertation Abstracts International, 1973(Oct), Vol 34(4-A), 1723.

2223. Yura, Michael T. & Galassi, Merna D. (West Virginia U, Coll of Human Resources & Education) **Adlerian usage of children's play.** *Journal of Individual Psychology*, 1974(Nov), Vol 30(2), 194-201.—Describes several psychological views of play, together with those of A. Adler. A child's misdirected goals and life style, and the concept of social interest as reflected in play, are discussed. Examples of play techniques are described to illustrate possibilities for psychological investigation and reorientation of the child's misdirected goals. Ways of dealing with attention-getting, bossy, and withdrawn children are noted. (21 ref)—R. Tomasko.

SOCIAL PROCESSES AND SOCIAL ISSUES

2224. Brandt, Willy. **A new deal for deprived children.** *Carnets de l'Enfance*, 1975(Apr-Jun), No 30, 3-13.—Proposes that structural and concomitant political modifications in relationships between rich and poor countries must be at the base of any program to balance distribution of food resources. Politics and ethics must go hand in hand if the tasks are to be accomplished.—Z. M. Cantwell.

2225. Cleveland, Harlan. (Aspen Inst for Humanistic Studies, Program in International Affairs, Princeton, NJ) **The Little League and the imperatives of interdependence.** *Educational Record*, 1975(Win), Vol 56(1), 5-9.—Argues that America's leadership and education (especially higher) crucially affect ability to interrelate with other nations and thus affect the world's survival.

2226. Dumont, Mathew. (Massachusetts Dept of Mental Health, Boston) **Can a dinosaur be taught to evolve? or The absurdity of trying to steer an octopus.** In A. B. Tulipan, C. L. Attneave & E. Kingstone (Eds), *Beyond clinic walls.* University, AL: University of Alabama Press, 1974. xii, 241 p. \$8.50.—Advises Americans in general, and mental health professionals in particular, to wage a battle against the power of the State and the dinosauric nature of bureaucracies tending toward overpowering human values and individuals.

2227. Freedman, James O. (U Pennsylvania) **Administration for the elderly.** *MH*, 1974(Sum), Vol 58(3), 39-43.—Discusses aging and the evolution of the administrative agencies that develop programs for the aged. It is argued that such agencies tend toward bureaucratic ossification and industry orientation, and that respect and dignity for the elderly could be restored by initiating new programs to correct these tendencies.—B. E. Allen.

2228. Fulmer, Gilbert. (Southwest Texas State U) **Equality, toleration and truth.** *Rational Living*, 1975(Spr), Vol 10(1), 38-40.—Presents a philosophical statement on the meaning of "truth" and discusses the acceptance of people's beliefs which may differ from one's own, without necessarily accepting them as true or equal to one's own.

2229. Gorse, William J. (Ohio State U) **Deviance in a small town: A study of progress and anomie.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2164-2165.

2230. Guntern, G. (U Lausanne, Clinique Psychiatrique, Switzerland) **[Social change and mental health.]** (Germ) *Psychiatria Clinica*, 1974, Vol 7(4-5), 287-313.—Presents some results of an ongoing longitudinal study of a village in the Alps which was isolated before the construction of a road system and which has since become a world-renowned tourist mecca. The social changes and the subsequent psychological, psychosomatic, and psychosocial difficulties during the period of the "cultural lag" are discussed. The economic change has altered the roles, distribution of work, traditionally learned behavior patterns, and underlying values and normative attitudes of the inhabitants. The most important parameters of the general stress and inadequate adaptation to social change are the raised consumption of alcohol, drugs, and tobacco and the psychosomatic and sexual behavior disorders. The study is continuing in order to determine how strong the correlations are between social change, stress, and disorders of adaptation. (17 ref)—English abstract.

2231. Meddin, Jay. (Southern Illinois U) **Generations and aging: A longitudinal study.** *International Journal of Aging & Human Development*, 1975, Vol 6(2), 85-101.—Investigated the relationship between age and subjective outlook. Over the years, a number of theoretical positions have been introduced to account for or to minimize age differences in attitudes, values, and beliefs. These theories of aging were organized, in the present study, into 3 basic sociological frameworks or models: the "generations" model, the "age status" model, and the "illusion of differences" model. Hypotheses derived from these models were tested through secondary analysis of survey data gathered in the US in 1964 and 1970. Samples numbered 1,549 and 1,482, respectively, and were drawn from 4 age groups, 21 yrs and older. Strong support was found for the "generations" hypothesis, weak support for the "age status" hypothesis, and no support at all for the "illusion of differences" hypothesis. (17 ref)—Journal abstract.

2232. Sarkar, S. N. & Hassan, M. K. (U Ranchi, India) **Economic conservatism as related to religion, caste, political affiliation and authoritarianism.** *Indian Journal of Psychology*, 1973, Vol 48(4), 64-70.—Studied the differences between subgroups of Hindus and Muslims (N = 200) by using the economic conservation scale of Rundquist and Stello along with the Indian adaptation of the California F-scale. The sample was matched on sex and education. Results show that each of the variables had a different effect on economic attitude, and indicated a positive correlation between authoritarianism and economic conservatism.—B. Roy.

2233. Scheffen, Albert. (Albert Einstein Coll of Medicine, Yeshiva U) **Communication, social control, and youth.** In A. B. Tulipan, C. L. Attneave & E. Kingstone (Eds), *Beyond clinic walls.* University, AL: University of Alabama Press, 1974. xii, 241 p. \$8.50.—Attempts to show that communication serves to maintain social order and to control the behavior of separate persons and factions. 5 types of human behavior and their prehuman origins are described, the approach is related to elements in social control, and the research is related to the theme of youth and the youth movement.

2234. **Sowder, Barbara J.** (George Washington U) **Some social-psychological aspects of Soviet propaganda: A content analysis.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2771.

2235. **Thorne, Frederick C.** **The problem of the inner cities.** *Journal of Community Psychology*, 1975(Apr), Vol 3(2), 162-163.—Argues that the only solution to the problem of inner cities in the US is to dismantle them entirely by having the government equalize all welfare payments in all areas, establish light industry in all sections of the country by subsidizing its removal from large cities, and change the character of large cities by limiting their populations primarily to workers and the self-supporting individuals.

Social Structure & Social Roles

2236. **Anant, Santokh S.** (U Lethbridge, Canada) **Sex differences in intercaste attitudes in Delhi.** *Psychologia: An International Journal of Psychology in the Orient*, 1975(Mar), Vol 18(1), 15-21.—Administered an intercaste-attitude questionnaire to 95 adults drawn from the general population and to 102 undergraduate and graduate students. It was hypothesized that a lower percentage of females than males would give liberal responses. This hypothesis was generally supported in the case of the adult sample, but either no difference or reverse sex differences were found in the student sample. Results are interpreted in terms of the selectivity of the female student sample and findings about the greater persuasibility of the females.—*Journal abstract*.

2237. **Atchley, Robert C.** (Miami U, Scripps Foundation for Research in Population Problems, OH) **Adjustment to loss of job at retirement.** *International Journal of Aging & Human Development*, 1975, Vol 6(1), 17-27.—Focuses on the impact of retirement on the individual's hierarchy of personal goals. If the job is high in that hierarchy and yet unachieved, then the individual can be expected to seek another job or a job substitute. If this is unsuccessful, then the hierarchy of personal goals must be reorganized. If the individual is broadly engaged, the hierarchy can be consolidated; if he or she is narrowly engaged, then alternate roles must be sought. If the search is successful, a new hierarchy emerges, and if not, the individual must withdraw. If the job is not high in the hierarchy to begin with, then no serious change in personal goals accompanies retirement.—*Journal abstract*.

2238. **Bell, Bill D.** (U Nebraska, Omaha) **The limitations of crisis theory as an explanatory mechanism in social gerontology.** *International Journal of Aging & Human Development*, 1975, Vol 6(2), 153-168.—Examined 5 specific assumptions of crisis theory as this orientation relates to the predictions of life satisfaction following retirement. Pre- and postretirement interviews were conducted with a group of 114 53-72 yr old males residing in an urban area. Data reveal a significant decline in life satisfaction, as predicted. Contrary to the theory, no significant changes in role behavior in 3 related areas—family, voluntary associations, and community—were found subsequent to retirement. Role changes accompanying retirement were not significantly associated with negative or positive changes in satisfaction. The correlation between work

commitment and the desire for subsequent employment was negative and significant. In sum, 4 of the 5 assumptions of the crisis theory do not receive support on the basis of the data. (44 ref)—*Journal abstract*.

2239. **Fine, Margret.** (U Dublin, Trinity Coll, Ireland) **Interrelationships among mobility, health and attitudinal variables in an urban elderly population.** *Human Relations*, 1975, Vol 28(5), 451-473.—Interview data from 169 urban elderly Ss was used to study the interrelationships among mobility, health, demographic, and attitudinal variables, and the characteristics of users and nonusers of an innovative transportation program. Self-assessed health, functional mobility, current income, life satisfaction, and ego integrity were positively correlated. Current income was positively correlated with life satisfaction and optimism about the future, but negatively correlated with authoritarianism and political powerlessness. The question is raised of whether increased mobility through improved transportation for the aged may also have an effect on improved mental attitudes for the aged. (22 ref)—*W. W. Meissner*.

2240. **Gubrium, Jaber F.** (Marquette U) **Being single in old age.** *International Journal of Aging & Human Development*, 1975, Vol 6(1), 29-41.—Posits that the everyday life of single elders differs from that of other old people. On the basis of interview data with 22 single elderly persons both about themselves and some aspects of the quality of their lives, it is proposed that single elders constitute a distinct type of social personality in old age. Interviews provide subjective and methodological evidence to support this. The normal social world of single elders is relatively isolated; not perceived in terms of loneliness, at present or anticipated; and considered an ordinary extension of their past. Death is conceived as "just another" event of their ongoing experiences. (16 ref)—*Journal abstract*.

2241. **Guntern, G.** (Hôpital de Cery, Lausanne, Switzerland) **[Social changes and alcohol consumption in a mountain village.]** (Fren) *Schweizer Archiv für Neurologie, Neurochirurgie und Psychiatrie*, 1975, Vol 116(2), 353-411.—Reports on the 1st study of a longitudinal investigation of the economic and sociocultural changes in a Swiss mountain village following the construction of a road in 1951 which transformed the community into an international tourist area, "invaded by mass modern tourism." Cultural lag and unsuccessful adaptations have been demonstrated, together with high anxiety, insecurity, and economic imbalances. One result of the pathological changes has been alcoholic consumption, although it is reported that fewer than 6% of the men and 0.3% of the women are designated as alcoholics. The study began 19 yrs after the onset of the social change associated with the "tourist invasion." The next study will be made in 1980.—*I. N. Mensh*.

2242. **Kapeller, Jack A. & Krueger, Albert H.** (St Cloud State Coll) **Who cares if I say good morning: An unobtrusive study of the elderly.** *International Journal of Aging & Human Development*, 1975, Vol 6(1), 51-56.—Studied approximately 80 senior citizens from 3 high rise apartment buildings to find if the elderly present special needs. The investigation consisted of a number of shopping trips by chartered bus to a supermarket. A tally was kept, recording responses to a greeting on a cue day

and responses on a noncue day when no greeting was given. 4 null hypotheses were tested, resulting in evidence that the elderly respond more often when a verbal stimulus is present. It was found that the elderly do present unique needs, and society must communicate more them and with those who are dealing with the elderly on a regular basis.—*Journal abstract.*

2243. Linden, Maurice E. (Thomas Jefferson U, Medical Coll) **The challenge of aging: It means growing up . . . not down.** *MH*, 1974(Sum), Vol 58(3), 34-38.

—Examines popular cultural attitudes affecting the aged in the US, focusing on 2 deficiencies: (a) cultural strivings and values as they now exist appear to place a heavy emphasis on youthful points of view, and (b) growing older seems generally looked upon as mental decline rather than development. It is argued that the human life span is divided into 2 stages: "evolescence" and senescence. The reactions of the aged and society in general to both phases are discussed.—*M. E. Pounsel.*

2244. Lozier, John & Althouse, Ronald. (West Virginia U) **Retirement to the porch in rural Appalachia.**

International Journal of Aging & Human Development, 1975, Vol 6(1), 7-15.—Successful retirement in old age depends on the existence of a set of social arrangements in which a person has accumulated a considerable longtime social standing that justifies his claims for support from the community. In a small rural Appalachian settlement, the pattern of retirement to the porch illustrates how claims by old men for social attention and care are anchored in the interests of others and are vested with significance for the entire community. While the use of the porch to facilitate the assertion of such claims on others may be more evident in small settlements, it is suggested that comparable strategies to afford successful retirement can occur in urbanized areas. These may be more difficult to develop and maintain, since collective sanctions to enforce the performances of relevant juniors are weakened or are transferred to formal facilities that render common services, not personal recognition, to old people.—*Journal abstract.*

2245. Mendelsohn, Mark B.; Linden, James; Gruen, Gerald & Curran, James. (George Mason U) **Heterosexual pairing and sibling configuration.** *Journal of Individual Psychology*, 1974(Nov), Vol 30(2), 202-210. Used a computer dating match technique to test the hypothesis that heterosexual dating pairs are most successful when the dyads closely duplicate the sibling configuration experienced in childhood by the dating partners. The birth rank and sex complementarity of 128 university students was studied, with heterosexual pair success measured by a Date Enjoyment Form. Results confirm the hypothesis. *R. Tomasko.*

2246. Mettlin, Curt & Hsu, Michael. (State U New York, Buffalo) **Alternative concepts for the study of the significance of influentials.** *Rural Sociology*, 1975(Sum), Vol 40(2), 152-161.—Notes that, although social scientists have a number of concepts to differentiate the importance of various agents of influence (significant others), all rely on the recipients' judgment in assessing an other's "significance." In this paper criteria involving observation of the activity of agents of influence themselves are proposed and investigated. The impor-

tance of a given source for a social system is examined in terms of number of persons influenced and the scope of influence for each. Data pertaining to educational and occupational influence on a sample of 98 high school students in rural Illinois, who were administered the Wisconsin Significant Other Battery, are explored.—*Journal abstract.*

2247. Mishara, Brian L. (U Massachusetts, Boston) **Changes for Bicêtre and its elderly residents: The paradox of progress.** *International Journal of Aging & Human Development*, 1975, Vol 6(2), 81-84. Describes recent changes at Bicêtre, the historic French institution, which exemplify an old paradox in the care of the elderly: improvements which benefit part of a society can mean more misfortunes for others. The effect of relocation of its elderly residents to make way for renovations poses important questions of priorities in societal values.

2248. Rosen, David H. (Brandeis U, Florence Heller Graduate School for Advanced Studies in Social Welfare) **Social relationships and successful aging among the widowed aged.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 2029.

2249. Sachs, Erich. **Individual psychology and Karl Marx.** *Journal of Individual Psychology*, 1974(Nov), Vol 30(2), 159-162.—Discusses the possibility that Adler's political convictions penetrated the development of individual psychology, thus jeopardizing the patient's autonomy. The main tie between Adler and Marx is their sociological interpretation of man. Adler's use of social interest as a basis for the evaluation of an individual, and his opposition to Marx's concept of man as shaped by society are described. Adler did not confuse contemporary society with his ideal society. His stress on the substitution of cooperation for withdrawal is emphasized.—*R. Tomasko.*

2250. Shimonaka, Yoshiko & Murase, Takao. [Self percepts of the aged: A comparison of SCT responses between groups of different living conditions and of different ages.] (Japn) *Japanese Journal of Educational Psychology*, 1975(Jun), Vol 23(2), 104-113. Compared 2 groups of Japanese females more than 60 yrs old (46 living with families and 69 living in homes for the aged) as to their values and their attitudes toward life and people, using a sentence completion test. Each group was divided into 2 age groups (60-74 yrs and 75 and over) to find developmental changes. Ss living with families had more positive attitudes toward family, people, life, and death, had more interest in the future, and consistently maintained positive attitudes beyond 75 yrs of age. (English summary) (24 ref)—*S. Choe.*

2251. Thomas, Elizabeth C. & Yamamoto, Kaoru. (U Arkansas) **Attitudes toward age: An exploration in school-age children.** *International Journal of Aging & Human Development*, 1975, Vol 6(2), 117-119. Studied attitudes toward young, middle-aged, and old persons in 1,000 5th, 7th, 9th, and 11th grades. 3 newspaper photographs were presented to the Ss who estimated the persons' ages and wrote stories about each photograph in preferred order. Scores from a semantic differential which provided 3 factors, evaluation-affect, and activity-potency, were used in 3-way analyses of variance to analyze Ss' attitudes. The overriding impression is that

these school children do not share the allegedly general, negative attitude toward old age. The age estimates showed judgmental accuracy and were remarkably uniform in both central tendency and variation. The overall order of choice was young person, first; old person, second; and middle-aged person, last.—*Journal abstract*.

2252. Wershow, Harold J. (U Alabama, Birmingham) **Days beyond recall: Subsistence homesteading in the rural South circa 1920.** *International Journal of Aging & Human Development*, 1975, Vol 6(1), 1-5.—Conducted approximately 100 semistructured interviews with Southern aged poor and collected data concerning South struggle to survive in the 1920s. People worked long hours for little, bartering farm produce for store-bought necessities. Primitive housing, education, and medicine sufficed. Both Black and White poor suffered brutal exploitation, despite which they review their life with satisfaction. It is hypothesized that, to maintain mental health, it is better to idealize the unalterable past. Several global assessments of morale are discussed.—*Journal abstract*.

Culture & Ethnology & Religion

2253. Bagley, Christopher & Boshier, Roger. (U Surrey, Guildford, England) **Demographic predictors of conservatism and racial prejudice.** *Australian & New Zealand Journal of Sociology*, 1975(Jun), Vol 11(2), 65-68.—Analyzes the power of demographic items to predict scores on a conservatism scale in 200 Dutch and 329 New Zealand adults. For the Dutch Ss, the highest correlation with conservatism was the frequency of giving to church funds; for New Zealanders, amount of church attendance. The most notable difference was the relative failure of age to predict conservatism in New Zealand compared with its high correlation in the Dutch culture.—*Journal summary*.

2254. Elifson, Kirk W. (Vanderbilt U) **Religious behavior among urban Southern Baptists: A causal inquiry.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2778-2779.

2255. Hamby, June. (U Tennessee) **Some personality correlates of four religious orientations.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1127-1128.

2256. Klauber, John. **Notes on the psychical roots of religion, with particular reference to the development of Western Christianity.** *International Journal of Psycho-Analysis*, 1974, Vol 55(2), 249-255.—Argues that religious faith has its origin in infancy when the child creates fantasies that justify the continued existence of the ever-present mother. The irrational concepts of religion, damnation, and the derivation of religious faith are interpreted in these terms. (16 ref)—*L. Lauro*.

2257. Koss, Joan D. (U Puerto Rico, Rio Piedras) **Therapeutic aspects of Puerto Rican cult practices.** *Psychiatry*, 1975(May), Vol 38(2), 160-171. Explores the phenomenon of possession trance in the ritual context by analyzing it as an active and perhaps necessary component in the development of significant personal relationships basic to the organization and goals of some religious cults. This view is suggested by data gathered in a study of social process in Puerto Rican

Spiritist cults which examined the relationship between patterns of cult social organization and the cult execution of a culturally patterned psychotherapeutic process for committed adherents, whose emotional problems are diagnosed by cult healers as manifestations of developing "faculties" for communication with the spirit world. (15 ref)—*Journal abstract*.

2258. Malev, Milton. **Discussion of the paper by John Klauber on "Psychical roots of religion."** *International Journal of Psycho-Analysis*, 1974, Vol 55(2), 257-259.—Comments on the paper by J. Klauber (see PA, Vol 55:Issue 2). The coexistence of 2 separate myths which gratify the same psychic need for divine protection against misfortune and death is noted. It is observed that the myths have their origins in 2 separate stages of psychic development.—*L. Lauro*.

2259. Rosenthal, Joel. (Private practice, Milwaukee, WI) **Southern Black student activism: Assimilation vs. nationalism.** *Journal of Negro Education*, 1975(Spring), Vol 44(2), 113-129.—Describes the nature and extent of protests by Blacks enrolled at institutions of higher education in the Southern US from early to present times. Influences of White students, Black faculty and administrators, White politicians, and societal events on activism among Blacks are detailed. It is concluded that (a) Blacks are still divided between integration and Black nationalism, but are more reflective; (b) the ethnic identity of Black colleges is imperiled; and (c) the same issues which produced protests in the past by Blacks are smoldering today. (65 ref)—*B. M. Anthony*.

2260. Song, John D. (Claremont Men's Coll) **Childhood and adolescence in the United States and Korea.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1716.

2261. Stein, Howard F. (Meharry Medical Coll) **Freedom and interdependence: American culture and the Adlerian ideal.** *Journal of Individual Psychology*, 1974(Nov), Vol 30(2), 145-158.—Discusses the conflicts between hierarchic and interdependent values in American culture. The hierarchical nature of American culture is characterized by vulnerability, underdogs, and rulers, while interdependence stresses mutuality, cooperation, and collaboration. Genuine interdependence is contrasted with destructive dependence. The American system of government is seen as a psychological compromise between the British system and an idealized democratic system. This system was developed in response to fears of both anarchy and repression. American freedom is described as avoidant, and mastery is observed to be more important than competence. The Adlerian view of autonomy as the basis of genuine social relations is considered a rational superstructure for survival. (27 ref)—*R. Tomasko*.

2262. Udick, William S. (Boston Col) **The post-Vatican II Jesuit candidate as identified by the MMPI: A comparative study of his characteristics and potential for perseverance.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1142.

2263. Zeiner, Arthur R.; Paredes, Alfonso & Cowden, Lawrence. (U Oklahoma, Health Sciences Ctr) **Field research with the Tarahumara Indians of the Sierra Madre.** *Biological Psychology Bulletin*, 1975(Feb), Vol 4(1), 10-15.—Describes the initiation of 2 experimenters

to field research with unacculturated Tarahumara Indians. Background information is provided regarding the Tarahumaras, their habitat, eating habits, and athletic prowess. Expected and unexpected contingencies encountered in field research are described. The unexpected warmth, friendliness, and trust of these people as well as the help of all those who aided in the quest to obtain psychophysical records from them are described. —*Journal abstract.*

Marriage & Family

2264. Abbas, Robert D. (U Missouri, Columbia) **A comparison of the self-perceived and mutually perceived interpersonal values of college freshmen & parents.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1071.

2265. Bottenberg, E. H. (Pädagogischen Hochschule Niedersachsen, Psychologisches Seminar, Braunschweig, W Germany) [Aggression and perceived parental educational style.] (Germ) *Psychologie: Schweizerische Zeitschrift für Psychologie und ihre Anwendungen*, 1975, Vol 34(2), 129-140.—190 young men (mean age = 21.3 yrs) were given 2 questionnaires, the first of which provided measures of acting out aggression and aggression inhibition. The other asked about the child-rearing styles of the respondents' parents, and yielded scores on rejection-hostility and affection-care. Acting out aggression correlated highly with rejection-hostility from both fathers and mothers. More complex relationships were found in the inhibition dimension, which could be related both to rejection and to affection depending on the sex of the parent and other factors. (French & English summaries)—*E. Coché*

2266. de Borggraeaf-Rauis, F.; Sand, E. A.; Smets, Ph. & Robaye, Ed. (U Libre, Ctr d'Etudes de la Croissance, Bruxelles, Belgium) [Evaluation of parental attitudes according to the PARI of Schaefer and Bell.] (Fren) *Enfance*, 1975(Jan-Apr), No 1, 5-14.—The Parental Attitude Research Instrument provided information from 80 mothers of 13-yr-olds participating in a longitudinal investigation. Of the 23 variables comprising the instrument only 14, each having at least 3 discriminative items were used. A factor analysis of the intercorrelations yielded the following factors: (a) feeling of obligation to control child's behavior and environment; (b) feeling of being a suffering, confined family head; and (c) concern with strictness, discipline, and rules. 2267. Diamond, Charles. (Boston U, School of Education) **An investigation of the relation between depression and hostility of adolescent girls suffering father loss.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1697-1698.

2268. Fineberg, Beth L. & Lowman, Joseph. (Community Hosp. Community Mental Health Ctr, Indianapolis, IN) **Affect and status dimensions of marital adjustment.** *Journal of Marriage & the Family*, 1975(Feb), Vol 37(1), 155-160. Compared the interactions of 10 maritally adjusted and 10 maladjusted couples, using a coding system based on the T. Leary circumplex. Relative use of Leary quadrants and quadrant sequencing patterns of the groups were compared. A self-administered measure of affective structure (inventory of Family Feelings) was

also administered. Major findings are (a) adjusted Ss communicated more affection and submission than did maladjusted ones and communicated more affection and submission than did maladjusted ones and (b) all Ss were more likely to show complementary sequencing patterns with some interesting differences between groups. Data from the self-report measure were consistent with the affective dimension of the behavioral coding system. (18 ref)—*Journal abstract.*

2269. Freeman, Charles W. (VA Hosp, Seattle, WA) **Adlerian mother study groups: Effects on attitudes and behavior.** *Journal of Individual Psychology*, 1975(May), Vol 31(1), 37-50.—Compared the effectiveness of Adlerian mothers' study groups (AMS) with traditional mothers' discussion groups (TMD). 36 mothers of 66 elementary school children were randomly assigned to the study and control groups. Instruments used included the Scale II of the Attitude Toward the Freedom of Children, the Child Rearing Practices Scale, and the Children's Behavior Checklist. Results indicate that the participants in the AMS group held significantly fewer controlling and authoritarian attitudes than controls. AMS Ss used spanking, withdrawal of privileges, confinement, bribery, and threats significantly less often. Differences between AMS and TMD mothers were not statistically significant. (29 ref)—*R. Tomasko.*

2270. Hertzman, Rebecca Z. (Boston U, School of Education) **Mother-preschooler interaction in a standardized setting: Measurement and assessment of class and individual differences as recorded on video-tape.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1615.

2271. Hirschowitz, Ralph G. (Harvard U, Medical School, Lab of Community Psychiatry, Boston) **Family coping patterns in times of change.** *International Journal of Social Psychiatry*, 1974-1975(Win-Spr), Vol 21(1), 37-43. Uses a figure-ground approach to analyze family coping patterns. 3 types of primary problems are described, involving the individual, the family, and the community. Medical, therapeutic, and sociological models are suggested for the resolution of each. 9 predictable changes in postindustrial society are noted along with several ways of coping with change. Healthy coping is characterized by an investment of energy in "intelligent worry work." Unhealthy coping patterns and their implications for counselors are noted. *R. Tomasko.*

2272. Labouisse, Henry R. (UNICEF, New York, NY) **Improve the quality of life for each family.** *Carnets de l'Enfance*, 1975(Apr-Jun), No 30, 14-22. Presents a descriptive analysis of the population problem from the point of view of individual human beings (the family and the child). —*Z. M. Cantwell.*

2273. Muller, Rita I. (U Pittsburgh) **Postural patterns in marital interaction.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 570.

2274. Murphy, Ronald J. (Private practice, New York, NY) **A rational, humanistic approach to punishment.** *Rational Living*, 1975(Spr), Vol 10(1), 28-31. Reviews the concept of punishment, biased with the attitude that punishment can be beneficial. The issue is discussed of how punishment can be most effective with a minimum of emotional side effects relative to rational humanism. Drawbacks to the use of punishment are also considered.

2275. Robertson, Joan F. (U Wisconsin, School of Social Work, Madison) **Interaction in three generation families, parents as mediators: Toward a theoretical perspective.** *International Journal of Aging & Human Development*, 1975, Vol 6(2), 103-110.—Focuses on the development of a theoretical perspective within which it is possible to empirically define parental mediation in interactions between grandparents and grandchildren. Using socialization theory and studies conducted by the writer and a colleague, 8 independent dimensions of parental mediation have been identified. This makes it possible to develop measurement indices for testing the postulate that parents act as mediators between the grandparent and grandchild generations in socializing both into their respective roles and thereby influencing the nature of their relationship.—*Journal abstract*.

2276. Robinson, Nancy D. (Columbia U) **Adoptive mothers' perceptions of stress in the agency home study.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2774.

2277. Scanlon, John. (Indiana U) **Sex roles, economic factors, and marital solidarity in Black and White marriages.** *Journal of Marriage & the Family*, 1975(Feb), Vol 37(1), 130-144.—Based on a 5-state probability sample of households, Black and White marriages were compared in terms of sex role norms and influences on economic and marital satisfaction. The total sample ($N = 3,100$) included 25% Blacks and consisted of marriages in which wives were aged 18-44 yrs, ever-married only to each other, and presently living with spouse. Divergences appeared by race with regard to measures of sex role egalitarianism. Basic processes were similar in both racial categories with respect to factors accounting for marital solidarity.—*Journal abstract*.

2278. Tourkow, Lawrence P. **A discussion of "The family group as a single psychic entity: Implications for acting out in adolescence,"** by J. Zinner and R. L. Shapiro. *International Review of Psycho-Analysis*, 1975, Vol 2(2), 247-249.—Argues that the concept of projective identification used by Zinner and Shapiro is more applicable to the externalization of the self representation than to the projection of drive representations.

2279. Turner, Joseph G. (Colorado State U) **Patterns of intergenerational exchange: A development approach.** *International Journal of Aging & Human Development*, 1975, Vol 6(2), 111-115.—Reviews the current theoretical literature, which continues to refute the earlier held viewpoint that the American family is an isolated unit with little or no contact with the extended family. 9 theoretical models are presented supporting the existence of rather definitive patterns of intergenerational exchange. Explanation is given as to how these patterns of exchange operate between generations and why they change over time. Suggestions are presented why the middle family unit of the 3-generational system eventually emerges today as the center of power or most influential unit (24 ref) *Journal abstract*.

2280. Ziller, Robert & Rosen, Jane. (U Florida) **Monitoring the meaning of love.** *Journal of Individual Psychology*, 1975(May), Vol 31(1), 51-64. Studied the meaning of love, using projective techniques involving the symbolic representation of self and others. Changes in self-esteem and evaluation of relationship were

studied for 4 couples over a 6-wk period. Results indicate lowered self-esteem and group esteem when the couples experienced stress. Both types of esteem increased after a couple successfully weathered a crisis. A strong positive or negative spiraling interaction effect for self-esteem was noted for couples in the period prior to commitment to each other. The study illustrates the compatibility possible between research tradition and humanistic psychology. (19 ref)—R. Tomasko.

Political & Legal Processes

2281. Bhattacharyya, S. K. (Central Bureau of Correctional Services, New Delhi, India) **Issues in abolition of capital punishment.** *Social Defence*, 1974(Jul), Vol 10(37), 16-23.—Reviews the reasons for capital punishment and rejects each based on worldwide data, concluding that the death penalty should be abolished.—R. J. Albers.

2282. Bird, Agnes T. **Women in politics: Changing perceptions.** *Journal of the Association for the Study of Perception*, 1975(Spr), Vol 10(1), 1-9.—Traces the history of women in American politics. Concomitant with women's greater political activity have been changes in the perception of women's role in society.—J. M. Kleinman.

2283. Dean, George W.; Davis, Paul; Morris, James E. & Fanning, Thomas. **Symposium: The right to treatment.** In A. B. Tulipan, C. L. Attneave & E. Kingstone (Eds), *Beyond clinic walls.* University, AL: University of Alabama Press, 1974. xii, 241 p. \$8.50.—Discusses the individual's legal right to treatment, deriving from the 14th Amendment of the Constitution of the US. 3 papers are presented.

2284. Dytrych, Zdenek et al. (Psychiatric Research Inst, Lab for Biosocial Family Research, Prague, Czechoslovakia) **Children born to women denied abortion.** *Family Planning Perspectives*, 1975(Jul-Aug), Vol 7(4), 165-171.—From the records of the Appellate Commission of Prague for the years 1961-1963, 220 boys and girls born to women twice denied legal abortions for the same pregnancy and a similar number of matched controls were selected for study. In 1971, when the children were 9 yrs old, data from many sources, covering more than 400 different measures for each matched pair of children were collected (e.g., school records, case history interviews with the mothers, and detailed physical and psychological examinations of the children). In general, statistical tests of significance revealed no gross maladjustment or maladaptation for either group of children, but there were some indications that the children born to women denied abortion suffered more illness, were less acceptable to their peers and teachers, and were less able to live up to their intellectual capacities.—S. R. Stein.

2285. Figlio, Robert M. (U Pennsylvania, Ctr for Studies in Criminology & Criminal Law) **The seriousness of offenses: An evaluation by offenders and nonoffenders.** *Journal of Criminal Law & Criminology*, 1975(Jun), Vol 66(2), 189-200. Attempted to determine if convicted offenders view the seriousness of offenses in the same manner as do middle-class nonoffenders—students at the University of Pennsylvania—with regard to (a) offense ranking, (b) absolute and relative weight

given to each offense, and (c) the degree of consensus about the seriousness of each offense. Also studied were the temporal trends in judging the seriousness of offenses, as reflected in the Sellin-Wolfgang Index of Delinquency applied to a similar student group 10 yrs later. Overall, the students rated offenses as only about half as serious as their counterparts had done 10 yrs ago. However, the judged relative severity of offenses within each group, particularly for the more serious forms of property and bodily violations, were almost unchanged. The differences between today's students and those of a decade ago were almost of the same magnitude as the differences between today's prisoners.—*R. Gunter.*

2286. **Gokhale, S. D.** (International Council on Social Welfare, Bombay, India) **Role of voluntary agencies and people in social defence.** *Social Defence*, 1974(Jul), Vol 10(37), 3-15.—Discusses the role of community participation in criminal justice systems in India. Public participation in state agencies is seen as a vital part of government which can occur in 4 different ways, from simple political support of policies to the actual usurping of state functions by community agencies.—*R. J. Albers.*

2287. **Le Ny, Jean-Francois.** (U Paris VIII, France) **[Psychology and politics in international relations.]** (Fren) *Bulletin de Psychologie*, 1974-75, Vol 28(16-17), 742-745.—Briefly describes the role of psychology in planning strategies directed toward the amelioration of international interactions and contacts. Attention is drawn to areas of research in psychology which are directly related to these issues: oppositions among forms of social organization; interindividual differences; cognitive structures; individual and group needs; and environmental conditions affecting life-styles.—*Z. M. Cantwell.*

2288. **Liebrand, Wim B.** (U Groningen, Netherlands) **An exploratory methodological inquiry contrasting traditional and humanistic methodologies in psychopolitics (Netherlands).** *Interpersonal Development*, 1974-1975, Vol 5(2), 94-101.—Studied the possible relationship between the degree of psychological health and progressive conservative political orientations by comparing 2 contrasting (classical-positivistic vs humanistic) research methodologies. 36 university students (humanistic group) were given information on theory and content of the questionnaire (based on A. H. Maslow's need hierarchy); 41 Ss (traditional group) received only the questionnaire. No fundamental differences were found between results obtained by the 2 approaches. The substantive results obtained under both conditions indicate that, by criteria derived in accordance with Maslow's growth model, progressives are psychodynamically better developed than conservatives.—*Journal abstract.*

2289. **Moreno, Francisco J.** **The myth of political rationality.** *International Journal of Social Psychiatry*, 1974 1975(Win Spr), Vol 21(1), 21-26.—Discusses the uses of irrational thinking in American politics. People are considered to use acquired information to justify rather than to alter basic orientations. The nonrational basis of the Kennedy political appeal is described as a by-product of strong emotional reactions bordering on hysteria. The culturally determined structure of language conveys a conception of the individual's relation to the universe. Belief in political rationality is noted to provide

the rationalization for the perpetuation of society's values.—*R. Tomasko.*

2290. **Peele, Stanton.** (U Michigan) **The ethnic basis of political behavior in South Africa.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 2028-2029.

2291. **Riedel, Marc.** (U Pennsylvania, Ctr for Studies in Criminology & Criminal Law) **Perceived circumstances, inferences of intent and judgments of offense seriousness.** *Journal of Criminal Law & Criminology*, 1975(Jun), Vol 66(2), 201-208.—Discusses the Sellin-Wolfgang index of delinquency as a potential social indicator and as an empirical referent of theoretical terms. Respondents had little difficulty inferring intent from the perceived circumstances, and there was little support for the Jones and Davis theory that different circumstances would lead to different degrees of willingness to attribute intent. Results indicate that in assessing the seriousness of criminal events perceivers make only unimportant inferences as to whether the offender intended the act. This suggests that external aspects of the event, such as the amount of injury, theft, or damage, is all that the respondent needs to make a reliable assessment of social injury.—*R. Gunter.*

2292. **Suedfeld, Peter; Rank, Daryllynn & Borrie, Roderick A.** (U British Columbia, Vancouver, Canada) **Frequency of exposure and evaluation of candidates and campaign speeches.** *Journal of Applied Social Psychology*, 1975(Apr Jun), Vol 5(2), 118-126. 3 slides, each showing the photograph of a college-age male, were shown either 5, 10, or 25 times to 95 undergraduates. After the presentation, the slides, plus a 4th not previously shown, were presented as photographs of candidates in a campus election, each being paired with a campaign speech. 3 speeches consisted of bland platitudes, whereas the 4th argued in favor of a large tuition increase. Ratings of the speeches and the candidates indicated that Ss were accurate in ranking the relative frequency of exposure of the 4 slides and that the controversial speech elicited less agreement and less favorable ratings than the 3 other messages. There were U-shaped curvilinear effects of exposure on Ss' agreement with the messages and with ratings of the persuasiveness of the message. Neither exposure nor speech effects were found in ratings of the candidates themselves. Implications of these findings for the "frequency of exposure" hypothesis and for political campaigns are discussed. (32 ref) *Journal abstract.*

2293. **Watkins, D. & Sampson, J.** **Attitudes of Australian adolescents to crime and punishment.** *Australian & New Zealand Journal of Sociology*, 1975(Jun), Vol 11(2), 62-64.—Attitudes concerning 3 aspects of crime and punishment were assessed by questionnaires given to over 4,500 students attending 27 high schools throughout New South Wales. The main finding is that these young Australians believe in the need for punishment and show confidence in the effectiveness of corporal and capital punishment in at least some cases.—*Journal summary.*

Psychosexual Behavior & Sex Roles

2294. **Gilbert, Arthur N.** (U Denver, Graduate School of International Studies, Colorado Seminary) **Doctor,**

patient, and onanist diseases in the nineteenth century. *Journal of the History of Medicine & Allied Sciences*, 1975(Jul), Vol 30(3), 217-234.—During the 19th Century masturbation was considered to be responsible for a variety of physical ailments. The wide variety of diseases formerly attributed to the so-called "solitary vice" by the medical community then—including insanity—is discussed. The social situation in which this explanatory phenomenon arose is shown to have supported this thesis which resulted in turn in the development of a mass reaction against masturbation similar to the medieval witch craze. The "masturbatory hypothesis" is shown additionally to have been seen as sufficient explanation for many diseases and their consequences—including death—for both the medical and the lay community, but in retrospect some authorities have adjudged the whole phenomenon as having been vicious and almost sadistic in the extreme. The unique "sacerdotal" role of the physician of that period is shown to have facilitated the development of the entire process. Other aspects of this subject are explored.—A. A. Walsh.

2295. Greenberg, Florine A. (George Washington U) **Psychosocial characteristics of pregnant school-age adolescents.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1613-1614.

2296. Horn, Joseph M. & Turner, Robert G. (U Texas, Austin) **Birth order effects among unwed mothers.** *Journal of Individual Psychology*, 1975(May), Vol 31(1), 71-78.—Studied 294 residents of a home for unwed mothers to verify the existence of birth order effect in premarital sexual activity and determine if firstborns are overrepresented in a population of unwed mothers. An excess of firstborns was found and was shown not to be an artifact due to changes in birth rates. Birth order differences in premarital sexual behavior are considered to reflect true differences in the behavior of first- and later born children. (20 ref)—R. Tomasko.

2297. Mundorff, Jan E. (Northern Illinois U) **Personality characteristics of selected college male heterosexuals, homosexual activists and non-activists.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1137.

2298. Nevill, Dorothy & Damico, Sandra. (U Florida) **Role conflict in women as a function of marital status.** *Human Relations*, 1975, Vol 28(5), 487-497.—Analyzes questionnaire data from 518 females regarding 8 role conflict categories: time management, relations with husband, household management, financial, child care, expectations for self, expectations of others, and guilt. Married Ss were found to express more conflict than other females, while never married and formerly married Ss did not differ significantly. Results indicate a generalized role expectation for females and the importance of the role of the husband in marriage. (18 ref) W. W. Meissner.

2299. Parclius, Ann P. (Rutgers State U, New Brunswick) **Emerging sex-role attitudes, expectations, and strains among college women.** *Journal of Marriage & the Family*, 1975(Feb), Vol 37(1), 146-153.—Used questionnaire data to assess the attitudes of female college students toward various dimensions of their adult sex roles, their perceptions of men's attitudes toward women's roles, the degree to which these attitudes and perceptions have changed between 1969 and 1973, and

the possibility that strains are arising with these changes. 2 independent random samples of an entire student body were selected; 147 responded in 1969 and 200 in 1973. A marked shift toward feminism was found in Ss attitudes, but little change occurred in their perception of men as relatively conservative. Strains may be developing as more women adopt attitudes which they believe men reject.—*Journal abstract*.

2300. Thorne, Frederick C. **Television talk shows and actualization neuroses.** *Journal of Community Psychology*, 1975(Apr), Vol 3(2), 165-174.—Suggests that TV talk shows discussing personality development and how to get along in life may constitute an important community resource in the mental health movement. Some qualitative observations of one such show, *The Phil Donahue Show*, which appears 5 days weekly and is oriented primarily to women, are presented. Among the topics most frequently discussed during a 6-mo period in 1973-1974 were feminine identity, women's liberation, sexual freedom, marriage, child raising, homemaking, and work mores. Observations of audience participants indicated considerable frustration, conflict, and maladjustment in all of these areas. Evaluation of the advice provided by the guest "experts" suggests that some advice is invalid, unrealistic, and not always suited to particular groups of women. It is concluded that actualization neuroses may arise from acquiring unrealistic personal goals and being made discontented with the status quo, and that considerable harm might be done by widely disseminating unproven or inapplicable concepts which may have sensational appeal but are not solidly grounded in scientific fact.—*Journal summary*.

Drug & Alcohol Usage

2301. Bejerot, Nils. (Karolinska Inst, Stockholm, Sweden) **Drug abuse and drug policy: An epidemiological and methodological study of drug abuse of intravenous type in the Stockholm police arrest population 1965-1970 in relation to changes in drug policy.** *Acta Psychiatrica Scandinavica*, 1975, Suppl 256, 277 p.—Presents a method using the systematic observation of injection marks to study the spread of iv drug abuse. Rates of abuse are related to changes in permissive and restrictive periods of Swedish drug policy. (13 p ref)

2302. Clark, Trudy. (United States International U) **Relationships between drug usage and life purpose of junior and senior high school students.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2763-2764.

drug abuse. *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2403.

2306. Westermeyer, Joseph & Walzer, Virginia. (U Minnesota) **Drug usage: An alternative to religion?** *Diseases of the Nervous System*, 1975(Sep), Vol 36(9), 492-495.—Studied 62 consecutive admissions (aged 17-25 yrs) to a psychiatric hospital to determine whether church attendance and drug usage are inversely correlated. As an assessment of contemporary church attendance, each S was asked whether he or she had attended church at any time in the 4 wks prior to admission. Ss were also questioned regarding their use of cannabis, other hallucinogens, amphetamines, sedatives and minor tranquilizers, narcotics, alcohol, over-the-counter drugs, hydrocarbons, and prescribed drugs. Usage patterns were determined for the following time intervals prior to admission: 1 day, 1 wk, 1 mo, 1 yr, and prior to 1 yr. The proportion of these patients reporting quite heavy drug usage exceeded that reported in surveys of high school, college, graduate and professional students, and service inductees. Use of hydrocarbons, narcotics, or prescription drugs was limited to heavy users. Heavy drug usage among these patients occurred frequently among females. It is suggested that drugs may be used by certain young people because they facilitate personal and social benefits formerly achieved by religious practice. (16 ref)—M. E. Pounsel.

2310. Gur, Raquel E. (Philadelphia General Hosp, PA) **Conjugate lateral eye movements as an index of hemispheric activation.** *Journal of Personality & Social Psychology*, 1975(Apr), Vol 31(4), 751-757.—In an experiment with 32 right-handed male undergraduates, it was found that Ss moved their eyes leftward when solving spatial problems and rightward for verbal problems when the questioner sat behind them. When facing the questioner, the Ss moved their eyes predominantly in only one direction, either right or left, regardless of problem type. Results indicate that the cerebral hemispheres, though specialized for problem type, are also preferentially activated within the same individuals. (28 ref)—*Journal abstract*.

2311. Klagholz, Leo F. (Catholic U of America) **Self-perception: The effect of positive and negative behavior on the neutral attitudes of seventh and eighth grade students.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1132.

2312. Mugny, Gabriel. (U Genève, Switzerland) **[Majority and minority: The level of their influence.]** (Fren) *Bulletin de Psychologie*, 1974-1975, Vol 28(16-17), 831-835.—Tested the hypothesis that the majority exerts its influence on group process chiefly at the level of "social" (verbal) responses, while the influence of the minority is chiefly felt at the level of individual "perceptive standards." Ss were 30 students 15-18 yrs old. The experimental task, response to the Mueller-Lyer perceptual illusion, was completed under "majority" and "minority" conditions. Analysis of data indicates that the majority exercised a strong influence on verbal responses of group members which persisted even in the absence of confirming data, but had no influence at the level of individual "perceptive standards," as operationalized in the time sequence of the experiment. The minority exercised influence at the level of perceptive standards, operationalized as conditions of equality, but had little influence on verbal responses.—Z. M. Cantwell.

2313. Rogers, Rex S. (U Reading, England) **On Totman's "An approach to cognitive dissonance theory in terms of ordinary language."** *Journal for the Theory of Social Behaviour*, 1975(Apr), Vol 5(1), 107-118.—Discusses R. Totman's approach and presents a related perspective emphasizing the mechanisms of response generation. Conventional social psychology is seen as a way to explain underlying plans for social behavior as well as exploring the nature of the response-generating mechanism. Social rules are a highly condensed, socially prescriptive code for interpreting reality. A 5-component model for response generation is presented, consisting of translators, an analyser, an integrator, a stable store, and a transitory store. (2 p ref)—R. Tomasko.

2314. Totman, Richard. (University Coll, London, England) **A reply to Rogers.** *Journal for the Theory of Social Behaviour*, 1975(Apr), Vol 5(1), 119-125.—Responds to R. Rogers's (see PA, Vol 55:Issue 2) criticisms of the author's dissonance model. Normative and counter normative actions are seen arising from different rule systems because of differences in classes of ordinary language explanation pertaining to each type of action. Rogers's model for generation of social actions is broader than the author's but it requires finer information to articulate the parts of it based on values. Dissonance theory is still considered to have much potential.—R. Tomasko.

Psicologia, Neurologia e Psichiatria, 1974(Oct-Dec), Vol 35(4), 507-535.—Reviews the literature of psychoanalytic ideology and technology and its application to large groups.

2318. Anzieu, D. [Introduction to the psychology of negotiation.] (Fren) *Bulletin de Psychologie*, 1974-75, Vol 28(16-17), 759-774.—Offers a description of the dynamics of negotiations and negotiators in terms of an empirical clinical psychology with the long-range objective of moving toward a precise theoretical model. The importance and pervasiveness of negotiations in modern life and the need to prepare negotiators and the groups they represent for the tasks of negotiation are underscored. (17 ref)—Z. M. Cantwell.

2319. Bell, Edward V. (Fordham U) **A comparative study of teenaged and adult interviewers eliciting drug information from youth.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2152.

2320. Blanchard, Paul D. (Eastern Kentucky U) **Small group analysis and the study of school board conflict: An interdisciplinary approach.** *Small Group Behavior*, 1975(May), Vol 6(2), 229-237.—Explored the concept of "conflict" within small decision-making groups (i.e., school boards). Questionnaires were sent to all 190 Kentucky school boards, with a 55% return rate. Based on answers to sociometric questions, results were categorized as "bipolar," defined when at least 50% of respondents on a board acknowledged "substantial conflict." "Unipolar" was defined by no apparent conflict; "nonpolar" was defined as conflict without discernible or consistent blocs. Thus, conflict was operationalized as an ordinal variable. (19 ref)—J. Rubin.

2321. Bochner, Arthur P.; di Salvo, Vincent & Jonas, Thomas. (Temple U) **A computer-assisted analysis of small group process: An investigation of two Machiavellian groups.** *Small Group Behavior*, 1975(May), Vol 6(2), 187-203.—Explored whether the WORDS computer program could assist in pinpointing Machiavellian behaviors in a group discussion situation. 60 Ss were administered the Mach IV and Mach V instruments. Ss who scored below the 25th percentile were labeled low Machs. Middle Machs were those who scored within 1 standard deviation of the median, and high Machs were those who scored above the 75th percentile. After a group discussion task, transcripts were punched into a computer, which reduced the data base to the 215 most frequently occurring words. Results indicate that the high Mach was one of the most frequent participants and provided much specific task information. Results do not indicate how the frequency of words related to influence on decision-making in the groups, unless it is by saturating the group with task-relevant information during critical phases of discussion. (30 ref)—J. Rubin.

2322. Earner, Mary A. **Silent dwelling: Well-spring of communication.** *Humanitas*, 1975(May), Vol 11(2), 167-174. Views silence as the basis of development of interpersonal communication.—W. K. Redican.

2323. Elman, Donald. (Columbia U) **Eye contact, interest, and arousal.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2765.

2324. Grandberg, Donald; Stevens, J. Scott & Katz, Sandra. (U Missouri, Columbia) **Effect of communica-**

tion on cooperation in expanded Prisoner's Dilemma and Chicken games. *Simulation & Games*, 1975(Jun), Vol 6(2), 166-187.—Sex of S, amount of communication (some or none), and type of game played (i.e., Prisoner's Dilemma, where the worst outcome for an individual comes from cooperating while the other person is not cooperating, and the Chicken game, where the mutually competitive choice is the worst outcome) were examined in an experimental gaming study of human conflict and communication. A total of 96 Ss were measured on the number of mutually cooperative choices, number of mutually competitive choices, a cooperative index score, and the number of messages sent. A complex set of analyses found no sex differences but did demonstrate that communication can operate as a main effect facilitating cooperation and can also function differently for different games. In the case of Chicken, communication merely increased the general level of cooperation, whereas in the Prisoner's Dilemma, the course of events over trials was reversed when the option of communication was present.—D. E. Anderson.

2325. Harvey, Virginia; DiLuzio, Geneva & Hunter, William J. (Kent State U) **A comparison of verbal and nonverbal groups.** *Small Group Behavior*, 1975(May), Vol 6(2), 210-219.—Studied the effects of verbal and nonverbal T groups on personality and attitude measures. Ss were graduate education volunteers. The verbal group was asked to keep movement to a minimum. The nonverbal group was allowed no talking. Movement exercises were accompanied by appropriate music. The FIRO-B, Personal Orientation Inventory (POI), and Osgood Semantic Differential were administered before and after the T groups. Independent *t* tests between groups showed no significant post test differences on the POI or FIRO-B. Within each group, a dependent *t* test indicated a significant negative change ($p < .05$) for the verbal group on the self-acceptance scale of the POI. The POI showed no significant differences for the nonverbal group. The FIRO-B showed a significant pre-posttest difference for the nonverbal group on the Wanted inclusion subscale. On 6 of the 11 concepts of the semantic differential, the verbal group responded in a more analytical fashion after being involved in the group. The nonverbal group scored significantly lower than the verbal group on 1 semantic differential concept. The hypothesis was refuted that the nonverbal group would produce greater acceptance of "spontaneous behavior."—J. Rubin.

2326. Huston, Ted L. (State U New York, Albany) **From liking to affiliation: Empirical tests of a two-factor model of social choice.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2766-2767.

2327. Macer, Ellen L. (U Notre Dame) **The effect of homogeneity in age and values upon member satisfaction in small groups of women.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 2027-2028.

2328. Myers, David G. & Lamm, Helmut. (Hope Coll) **The polarizing effect of group discussion.** *American Scientist*, 1975(May-Jun), Vol 63(3), 297-303.—A review of the extensive literature shows that group discussion produces a group-polarization tendency, rather than a risk-shift effect as was earlier believed. Early studies, beginning in 1961, indicated that group discussion tends

to enhance the average pregroup inclination of the group members. Subsequent studies resulted in other generalizations, which later studies challenged. Data are cited to illustrate the stages by which a psychological research area is developed. The 2 recent theories of interpersonal communication and informational influence do not function as separate processes, but instead feed each other. Recent experiments explain some problems of "groupthink" and suggest ways to avoid them. (46 ref) —G. S. Speer.

2329. Reddy, W. Brendan. (U Cincinnati, Community Psychology Inst) **Diagnosing team problem-solving effectiveness: A comparison of four populations.** *Small Group Behavior*, 1975(May), Vol 6(2), 174-186.—Compared the problem-solving and decision-making performances of business administration students, middle managers, elementary school teachers, and elementary and secondary school principals. Each group was measured in time-to-plan and time-to-execute the Leggo Man exercise. Business students and managers spent significantly more time planning their assembling strategy than teachers or principals. Other planning time differences were nonsignificant. Business students and managers spent significantly less time than teachers or principals in execution of the task. Teachers were also significantly faster than principals in execution. Results are generalized to all moderately complex problems. (35 ref) J. Rubin.
